STATE LIBRARY.

No 97009

When, from whom, and how this volume was obtained, with the price paid, if any, may be found opposite the above number in the Register of Books, which is always open to inspection.

Extract from the Political Code.

SECTION 2296. Books may be taken from the Library by the MEMBERS OF THE LEGISLATURE, DURING THE SESSIONS THEREOF, and by other State officers at any time.

SEC. 2298. The Controller, if notified by the Librarian that any officer has failed to return books taken by him within the time prescribed by the Rules, and after demand made, must not draw his warrant for the salary of such officer until the return is made, or three times the value of the books, or of any injuries thereto, has been paid to the Librarian.

SEC. 2299. Every person who injures or fails to return any book taken is liable to the Librarian in three times the value thereof.

No person shall take or detain from the General Library more than two volumes at any one time, or for a longer period than two weeks. BOOKS OF REFERENCE SHALL NOT BE TAKEN FROM THE LIBRARY AT ANY TIME.—[Extract from the Rules.]

☞The Foregoing Regulations will be strictly enforced.☜

MINING AND SCIENTIFIC PRESS.

An Illustrated Journal of Mining, Popular Science and General News.

BY DEWEY & CO., Publishers.

SAN FRANCISCO, SATURDAY, JULY 5, 1884.

VOLUME XLIX Number 1.

The California Rock Drill.

We had an opportunity of examining at work this week the California Rock Drill, a new machine recently patented through the MINING AND SCIENTIFIC PRESS Patent Agency. It has the peculiarity of being a perfect hand or power drill, and the blow on the drill bar is made by a sledge just the same as in hand drilling, which is a different system than is usually adopted.

The engravings given herewith illustrate the machine, showing it as driven by hand, by hurdy gurdy wheel, and by direct attachment to hurdy gurdy. There is still another form where an air or steam cylinder is attached directly to the crank.

A body bar carries the power mechanism, the drill, the hammer, and the means for operting the hammer and rotating the drill, the bar being suspended from and adapted to slide on a cross-bar attached to a supporting column.

The attachment is made in such a manner as to have a vertical horizontal or inclined adjustment. The cross bar has a trunnion journaled in a bearing fitting in a sleeve and fitted upon the column. As the crank or pulley rotates the shaft, a cam or eccentric draws the hammer back, at the same time compressing a spring, which on being released by the cam, throws the hammer suddenly against the rear end of the drill. The drill bar is so arranged by means of a tension apparatus and a spring that there is no jar and this tension is capable of regulation. The small coiled spring acts so as to take off the jar. The feeding apparatus is arranged by a hand screw, a chain wheel, and chain rotating the drill bar automatically at each stroke. With power the machine strikes about 400 blows a minute; by hand of course fewer blows are struck.

Fig. 1 represents the hand rock drill, with fly-wheel and crank, operated by hand power. This machine is fitted to use ¾ octagon steel, and has a capacity to drill 2 holes 3 feet in depth without moving machine from guide-bar, has a 7-lb. hammer, and can be run by hand 150 blows per minute, and strike any blow it is possible to make drill bits stand in hard rock. The power necessary to run this machine is very light, so that any man can work the machine until the drill bit becomes dull without being exhausted. The weight of this machine, including column, is about 175 pounds, and owing to the easy manner by which the cross-head can be removed from the machine, one man can easily handle and set up for work, so no part will weigh over 80 pounds. This machine costs, with one set of 8 drills, two extra springs and chuck, $225.

Fig. 2 shows the hand drill driven by power. This has a groove cut in fly-wheel, driven by an endless rope from a hurdy gurdy wheel placed at any distance desired away from the machine. The hurdy wheel being light, can be easily moved and handled by one man. They have a tightening device on the hurdy frame, which always keeps an even tension on the rope. The machine driven in this manner can be run 250 blows per minute with a 3-16 nozzle under 175 feet hydraulic pressure, or driven with a steam pump at 80 pounds pressure. Price of this machine, including hurdy wheel, hose, gate, nozzle, and everything complete for work, $300. The rope can be run any reasonable distance from the source of power.

Fig. 3 shows the power drill operated by a hurdy gurdy wheel attached direct to the machine. This machine can be driven by a hurdy wheel, as shown in the cut, or by an endless rope running to any distance from the machine, driven by steam, hydraulic or horse power. In places where water is an object, this machine can be operated by a steam pump, with water tank or sump, pumping the water over and over if desired. This machine is fitted to use ⅞ or 1 inch octagon steel, will drill 1¼ inch holes five feet or more in depth without removing cross-head from machine, and can be run up to 400 blows per minute. This machine is especially designed to drill in cement, gravel or scamy rock, where the drill is inclined to run to one side; the drill being held firmly by means of a rest near the mouth of the hole, also at its rear end in the same manner, it is almost impossible for the drill to advance other than in a straight line; in other words this machine will drill in a straight hole in material that other machines can not. The weight of this machine is about 375 pounds. Price, including hurdy wheel, $375; or without hurdy wheel, fitted to run with endless rope, $325.

A larger size power rock drill, with trunk engine combined, mounted upon column is also made. This drill can be run by live steam direct, or by compressed air, as desired. Duplicate parts may be obtained also.

By striking direct on the head of the drill and holding the drill against the bottom of the hole while it revolves positively at each stroke of the hammer, a great advantage is gained, causing each and every blow on the drill, to do the same amount of work without lessening the force of the blow by turning the drill.

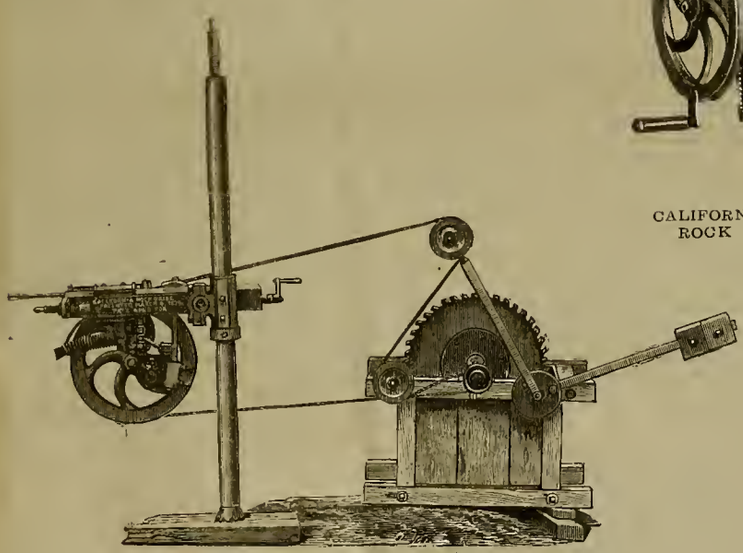
With the large power drill an eccentric operates the hammer, instead of a cam, so a very light blow may be struck on starting a hole, by running more slowly. When once the hole is started, 400 blows a minute may be given.

This machine is an exceedingly practical one, and requires little power to run it. The hammer used is really a sledge, and the spring throws it forward with good effect. In working in granite, the hand drill will drill an inch a minute in a dry hole.

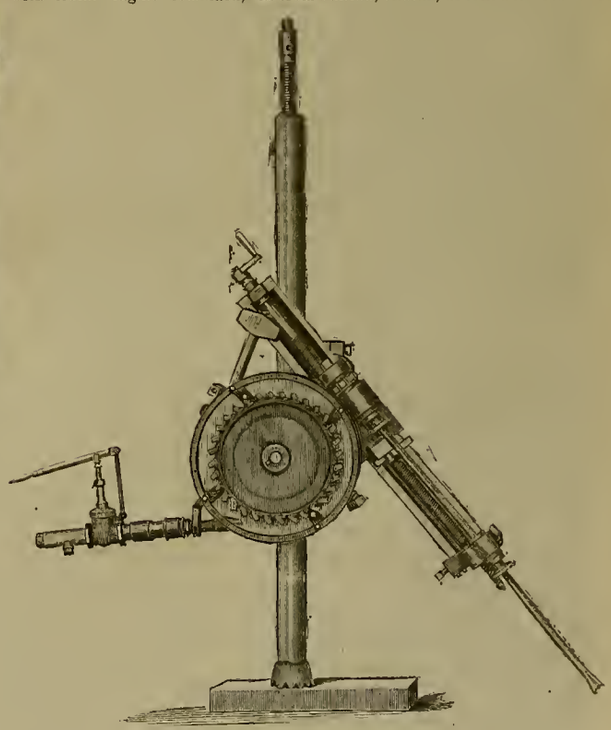
Three of these drills have been at work at the large South Yuba tunnel, five miles from Nevada City, for a year and a half. These have been run by a little hurdy gurdy direct on the machine. They had 175 feet of pressure and the machine uses about three inches of water to run it. Water was carried into the tunnel in a pipe. The power drill will do the work of ten men.

The company is now constructing 50 hand and power drills at Pittsburg, and making them out of crucible steel, so as to get lightness and strength. These will be here soon to be put on the market. Mining men will do well to call at the headquarters of the California Rock Drill Co., 32 First street, and see these various styles of drills at work.

CALIFORNIA HAND ROCK DRILL.



CALIFORNIA HAND ROCK DRILL, WITH HURDY GURDY.



CALIFORNIA POWER ROCK DRILL.

ALASKA MINES.—Mr. George E. Pilz writes us from Juneau, Alaska, as follows: Times are lively up here. The placer mines are all running full blast, and are taking out the usual amount of dust. Heavy preparations are being made to start the quartz mines in earnest. The Alaska Manfg. Co. have penetrated their ledge by a tunnel, by aid of power drills, and have proven their ledge to be over 500 feet in width, all in a good average ore, of about eight to eleven dollars per ton. They are building now a saw mill on their mill site to cut their timber and lumber for a 120 stamp mill. They are employing every idle man, white as well as Indian, in grading, ditching, etc. Nothing is doing yet on quartz on the mainland.

THE Central and Southern Pacific Railroad Companies paid off resident employes Tuesday, and those living in the interior will receive their wages within the next few days.

THE ten-stamp mill on the Marshal mine in Calaveras is being rapidly pushed forward to completion. Big results are anticipated when the mill gets to work.

CORRESPONDENCE.

We [illegible], unendorsed, opinions of correspondents.—EDS.

The Climate of Reno and of the Sierra Nevada Region in General.

[Written for the PRESS by PROF. GRANVILLE F. FOSTER.]

The climate of any particular place is a resultant of the direct effect of the sun's rays (which effect differs in the ratio of the cosine of the latitude) modified by altitude above the sea level, quality of soil, slope of land, relation to mountains in the vicinity, contiguity to bodies of water, amount of cloudiness, amount of rainfall and direction of prevailing winds. What the effect of each one of these may be in the make-up of the observed climate of any given place is the province of the meteorologist to determine, and though absolute truth may not always be reached, yet he is able to resolve the resultant into elements which at least will account for the facts observed. It is the aim of the writer of this article to present some of the peculiar features which characterize the climate of Reno; and since this city is so situated as to be admirably adapted to be used as a representative of the climate of the whole region of the Sierra Nevada mountains, the general features of this entire region will thus indirectly be presented.

Reno is situated in the Pacific coast region, in latitude 39½° north, at an elevation of 4,507 feet above tide-water, and is moreover shut off from the direct influence of the Pacific by the mighty mountain barrier which lies to the west. The whole Pacific coast (which by common consent is understood to mean the whole country for three or four hundred miles inland which borders on the Pacific ocean) differs very widely indeed in climatic conditions (and hence in climatic character) from those that prevail in the valley of the Mississippi and upon the Atlantic slope. In either one of the latter, the climate is characterized by extremes—extremes in temperature, rainfall, storms, and calms, with now and then a cyclone, by way of variety. The extremes in temperature are not apparent alone in the mere contrast between the mean of winter and that of summer, but oftentimes a single day may present extremes of heat and cold, of storm and calm, of sunshine and shade, perfectly astounding to a resident of the Pacific coast, who for the first time experiences them. An incident coming under the writer's observation will serve to illustrate the fact that this statement is not overdrawn. The locality was Alton, Ill., on the Mississippi river, latitude 39° north, the time midwinter. A season of extraordinary warm weather for the season, was succeeded by a violent thunder-storm, and this latter by a gale blowing from the northwest, with almost the speed of a hurricane, and three hours were sufficient to reduce the thermometer from 72° to 32° and the next morning the low temperature of 20° below zero was reached. So very rapid was the change that it was facetiously said that ducks had their bills frozen into the mud before they were able to extract them. A few years ago in the State of Minnesota there had been a season of unusually warm and pleasant weather during the month of January, and even February was ushered in with the same weather still continuing. On a certain day that seemed to reach the very climax of the beautiful, hundreds of farmers, many accompanied with their families were spending the day in Saint Paul and Minneapolis. No suspicion that any change could occur in the weather, seemed to enter the minds of the great number of people who were visiting these cities, since not a cloud obscured the sky and the sun shone out kindly and warmly. A little after noon the wind changed, a gale set in, the sky speedily clouded, instantly the very sky was filled with fine blinding snow and the thermometer rapidly descended, the farmers hastened towards home, but in many cases, horses and their riders were frozen still ere they were able to reach half the distance. These blizzards of Dakota, Iowa and Wisconsin are no myths: they are, alas, altogether too real and too natural to make them desirable to him who unfortunately is called upon to brave their fury, nor are they so infrequent as to be considered anomalous, for it is a rare thing indeed if a winter should pass away without one or more of them. On the other hand, we might expect the summer of these regions to be temperate and delightful, but that they are almost as disagreeable and as disastrous in their effects as the winters, let one judge from the long list of persons published in the newspapers as dying of sun-stroke in these very regions every summer.

In Boston, with an oceanic climate, the annual range of temperature is fully 140°, and in St. Paul, with a continental climate, it reaches 150°, but in Reno in 1882 it amounted to no more than 90°, and even in 1883, when there were extremes of cold in winter and of heat in summer, it only reached 105°. In San Francisco the range is seldom more than half this last named amount.

The climate of the whole Pacific region, though great differences are seen in comparing different sections, is characterized, as compared with other regions of the continent: 1st, by a less difference between the mean temperature of winter and that of summer; 2d, by a higher mean annual temperature than would be expected both from latitude and from elevation above the sea level; 3d, by a greater difference between the mean temperature of the day and the night; 4th, by an absence of cyclones and blizzards, and a paucity in the number of thunder storms; and 5th, so far as California and Nevada are concerned, by periodical rains, the summers being perfectly dry and the winters more or less wet, though very little rain ever falls in Nevada.

Waiving a reference at least here to the first feature as named above, the truth of the second will be seen from the fact that at Eastport, Maine, in latitude 44° 50', the mean annual temperature is only 43° Fahr., but one must go on the Pacific coast as far north as 57° in order to find the same mean. As we move from the shore of the Pacific inland, the extremes are found to be more marked, but nowhere are there any changes which approach in amount and violence those which obtain east of the Rocky mountains, while even here the moderate changes which do obtain are far less disagreeable than such changes would be elsewhere, since a cold but very dry air (even when the temperature is far below zero), is far more bearable than a damp air of a high temperature, as witness the piercing effect of an "easter" in Boston, or a "norther" in Texas, for, although the temperature when either of these winds are blowing may not be below 45°, yet it will be most uncomfortable, disagreeable, piereing, as it is familiarly said, "to the very bone." Again, when great heat prevails, the great dryness of the air in California and Nevada prevents it from becoming oppressive, since the very rapid and yet often insensible perspiration from the skin keeps the heat of the body within a comfortable limit. The third feature mentioned is indeed a marked one for the whole Pacific region, but of course more especially true of the higher levels of the Sierra Nevada mountains, more particularly on the eastern slope. Here, in consequence of the almost constant sunshine, the days are warm even in mid-winter, as high as 6,000 feet above the sea, while by the rapid radiation of the accumulated heat of the day through a dry and thin atmosphere the nights, even in midsummer are quite often very cool. In summer the days in regions even as high up as 8,000 to 10,000 feet are often very warm, and on the high peaks of the Sierra Nevada mountains at, an altitude of 12,000 or 13,000 feet, the heat at mid-day is great enough to make out-door traveling pleasant without an overcoat. The writer has found it quite pleasant in an afternoon of mid-winter, in direct sunshine, to go without an overcoat, though several feet of snow lay unmelted around him, even at as high an altitude as 7,000 feet above sea level. It is these warm sunshiny days and cool, clear nights, when the very stars seem to hang like gems upon the brow of the sky, that constitute the peculiar charm of the climate of the Sierras—a climate to be appreciated by those who have suffered from the damp, sultry atmosphere of a mid-summer in the valley of the Mississippi, where oftentimes the nights are scarcely cooler than the days, and here, for the benefit of the general reader, the writer will consider briefly a few of the reasons for so pleasant and agreeable a climate as exists in Reno, and in the Sierras generally.

It is generally known that on ascending upward from the sea level the temperature of the air steadily declines, the fall being about one degree Fahr. for every 330 feet of vertical elevation, but it is not generally known that the effect of the sun's rays, when arrested, as upon the skin for instance, is found to increase as the altitude above tide-water becomes greater, and not to decrease as many suppose. A traveler, who some years since ascended the very lofty volcanic peak of Iztaccihuatl, near the city of Mexico, makes the statement that when far above the line of eternal frost, the direct rays of the unclouded sun peeled the skin off his neck, face and hands, while waist deep in snow. Now, the low temperature of the air in high altitudes is easily accounted for.

The sun's rays, in consequence of their intense penetrating power, readily pass through the atmosphere. A small percentage [according to observations with Pouillet's pyrheliometer, from 20 per cent to 40 per cent (varying with amount of vapor), when the rays penetrate vertically,] being struck down or absorbed in the fifty miles of medium through which they must pass. The amount of heat thus absorbed in the passage of the sun's rays, does not invalidate the general statement that the air is heated by convection, that is to say, the air in contact with the earth alone is heated, and thus becoming specifically lighter, is pushed upward by the colder air rushing in to take its place. Now let it be supposed that in any given region equal weights of air taken from different elevations contain equal amounts of heat, yet the tenuity or thinness of the air in the upper strata of the atmosphere would, in such a case, indicate that the intensity of the heat in such expanded air must necessarily be very low. Though not generally appreciated, there is a great difference between intensity and amount, as applied to the forces of nature.

All bodies in expanding consume more or less heat, or make it latent, as well as diminishing the intensity of the heat not made latent; hence, in the process of expanding air the sensible heat is diminished both in quantity and in intensity. The heat consumed or rendered latent, called scientifically *specific heat*, is used in effecting certain molecular changes absolutely necessary to the phenomenon of expansion. In consequence of these scientific facts the air grows colder as the altitude above the ocean increases.

But, as before said, there is a measurable quantity or amount of heat stricken down or absorbed in the passage of the sun's rays through the atmosphere. This amount will vary, first as to the depth and density, and second as to the humidity of the atmosphere passed through; and since these conditions increase in amount (density and humidity increasing in an increasing ratio) as the level of the sea is approached, the amount absorbed in the first thousand feet above sea level being considerably in excess of the amount absorbed in the second thousand, and so on. We would therefore reasonably expect that when the sun's rays are caught and imprisoned they would show a higher effect in higher altitudes than in lower ones, and such, on experiment, is proved to be the fact. Using Pouillet's pyrheliometer in very high altitudes, it has been proved that the sun's direct effect is sufficient to elevate the mercury of a thermometer to many degrees above 100° Fahr., while at the same time the temperature of the surrounding air was 40 or 50 degrees below zero. By means of such an instrument it has been conclusively proved that the intensity of the sun's rays grows greater from the level of the sea upwards, the difference in intensity at any two points at different altitudes in the same locality being measured exactly by the amount of heat absorbed in the vertical depth of air lying between the two points. Though not essential to the design of this article, the writer cannot help referring to the question which will likely arise here in the reader's mind, viz.: If it is true that the direct rays of the unclouded sun have greater effect when arrested in higher than in lower altitudes, why is it, then, that the snow on the summits of the loftiest mountains never melts, though bathed in the direct rays of even a tropic sun? The answer is easy. Snow does not, like rocks, earth, wood, etc., arrest—it only reflects—and whenever the temperature is far below the freezing point, all the heat falling upon the snow is reflected into the cold air, to be dissipated through it, or if there be any arrest of heat at all (and there is a very little), it is not sufficient to raise the temperature of the snow to the melting point. The reader will readily perceive that when the temperature of the air is above the freezing point the melting of the snow mainly proceeds from the heat imparted to it from the warm air in direct contact, though in this case the sun's direct rays do have more influence than when the temperature is very low.

The facts which have just been stated fully account for the very mild day-temperature of the elevated regions east of the Sierra Nevada Mountains, in which the writer of this article lives. Because of the extreme dryness of the atmosphere and its thinness as well, the sun has no sooner risen, then there is a sensible rise in the temperature, increasing till after noon, making even a midwinter afternoon pleasant, especially in the direct sunshine, while, on the other hand, the quick radiation of the earth's heat, through the very same dry and thin atmosphere makes even the summer night (however hot the day) cool and pleasant, hence this region, partaking of the general mildness of the Pacific Coast, modified, however, duly for the altitude, cut off from Arctic waves of air and hence from all blizzards, is characterized by a high day-temperature and a low night-temperature throughout the year, while as compared with the same latitudes in the East, the contrast between winter and summer is not very great.

And now we will hastily bring this article to a conclusion by presenting a few statistical comparisons between Reno, Boston and Chicago, all three of which have very nearly the same mean annual temperature.

	Spring.	Summer.	Autumn.	Winter.	Mean.
Reno.....	47.86°	74.19°	49.47°	23.44°	48.74°
Boston.....	46.30°	69.10°	51.60°	28.90°	48.90°
Chicago.....	44.90°	67.30°	48.80°	25.90°	46.70

Let no one imagine that because of the similarity of the above figures, that there must needs be a resemblance in respective climates of the three cities, since there is very little resemblance at least between Reno on the one hand and Boston and Chicago on the other in this respect. The high summer mean of Reno signifies very warm days (not disagreeable days however because of the dryness of the air) though the nights are cool, while the heated season of Chicago and Boston, however brief it may be is especially disagreeable, from the fact that the nights are nearly as warm as the day, and the damper air adds materially to the discomfort. The low winter mean of Reno does not signify a more uncomfortable and disagreeable winter than at Boston or Chicago, since from the clear, warm days (however cold the nights may be,) the absence of strong winds at this season, the winter days at Reno are almost as pleasant as the summer ones.

Reno, Washoe Co., Nevada, June 19, 1884.

Lost Rivers Vs. Wood River.

A Coming Mining Region.

EDITORS PRESS: It is now well established that the Wood River region contains some, I might say, "many paying mines." But I wish to call the attention of mining men, capitalists and prospectors, to that region known as Big and Little Lost rivers. Here is a country that is bound to prove very rich and extensive in lead, copper and silver mines. Many large veins have been discovered and the surface showings of ore rivall any mines on Wood River for both richness and quantity of ore. On Little Lost river, I have taken surface ore from the Ingersoll mine, that assays over a thousand ounces in silver besides being heavy in lead and copper. The vein is large and well defined running through heavy iron stained quarztite. The lode is nearly vertical. I know of no better prospect for a heavy paying mine than this same Ingersoll claim. Then we have in this district, one, if not the largest galena carbonate mines in Idaho territory, and that is the Daisy Black Mine. It is wonderful to behold the great body of ore now in sight at this mine. It is estimated that there are over forty thousand tons of galena and carbonate now exposed, still the deepest shaft is only a little more than a hundred feet. The pay ore is from 12 to over 75 feet in width. The outcrop is boldly traceable for a thousand feet. This mine like the Ingersoll, is in a black iron quartzite formation. The ore goes down nearly vertical and is evidently a fissure vein. Considerable of the Daisy Black carbonates carry over a thousand ounces of silver per ton, and as there are both lead and copper ores associated in this mine, there is every reason to believe that the ore will continue rich in silver.

In Idaho wherever lead and copper ores abound in the same mine there is the place to get high-grade silver ores. Between the Ingersoll and Daisy Black is situated the Tyndall lode, another splendid showing of carbonate, galena and copper ores. North of, and adjoining the Daisy Black, we find the Alice and Great Northern claims, both of which are fine prospects for proving good paying mines. The ore is of good grade to commence with. I know of no better camp for mining capitalists to purchase good properties than what I know of on Little Lost river. These mines can be cheaply developed; wood and water is plentiful, lime and iron in abundance for fluxes. The climate is such that the mines can be worked all the year.

I am really surprised to see this region opening up so slowly. Surely no capitalists have examined this region! If they would I know they could soon find splendid bargains and open up these great veins of rich ore. Then, over on Big Lost river, near Alder gulch, are some of the largest lodes of heavy copper ores known in the Northwest, mountains of ore, not only heavy in copper, but carrying also considerable silver. And in this same locality are several large galena carbonate lodes that are opening up very satisfactorily to the fortunate owners. This Big and Little Lost River region is, according to geological evidence, a great mineral country. It is composed mostly of crystalline and metamorphic rocks, with here and there a dyke of lava sufficient for mineralizing or concentrating the ores into large bodies, so as to be economically and very profitably worked. The ore is rich, and there is lots of it; consequently these Lost River mines—lead, copper and silver—are going to prove of immense value. Should any mining capitalists read this article, I trust they will investigate this Lost River region, and open up some of these large lodes. They can be bought at a great bargain and on easy terms. About all that is needed is mining machinery, concentrators and smelters for treating the ores right at the mines. There is no question about the mines paying. The mines show for themselves. The only question is, will monied men go in and examine? The prospector can't do it all. He can find the mines, but it takes money to buy quartz mills and smelters. In concluding this article it may be well to say, that I am willing to verify my statements by going with any mining capitalists, and show to them the mines that I have seen, and also show to them the bargains that I know of in the Lost River country.

It is not necessary to go to the cold snowy Coeur d'Alene region for goodly vestments, when fully as good may be had in a far more genial climate.

CHARLES F. BLACKBURN.

Salt Lake City, Utah, June 24, 1884.

YAVAPAI COPPER BONANZA.—Since the 15th of last month, on which day the smelter of the United Verde Copper Company resumed operations, it has produced 171 tons of black copper, averaging 86¾ fine, and carrying 120 ounces in silver to the ton. The monetary value of the gross product of copper being $44,460, and the value of the silver $20,420, which, when sold in market, will net the company about $25,000 clear of all expenses; being an average profit of nearly $1,600 per day for the 16 days' run, with the use of a 30-ton smelter only. We are informed that the company has a supply of coke sufficient for all purposes during the present month; during which time it is estimated that the product will be fully 300 tons of copper an average of 10 tons per day, carrying 150 ounces per ton in silver. It is authoritatively stated that, after paying all the expenses of the past winter building sheds, opening the mines, erecting hoisting works, etc.—that on July 15th next, the company will declare a dividend of $45,000, which will make its third during the present year, being an aggregate of $142,000 distributed during the present year among stockholders, as the result of seven months of active running time. Should such dividend be declared the United Verde Copper Co., will be the only copper company in the United States doing so, as even the great producers of Michigan—the Hecla and Calumet—have failed to do so.—*Arizona Miner.*

MECHANICAL PROGRESS.

An Optical Test for Iron and Steel.

The question of distinguishing between iron and steel still engages considerable attention. The *Revue Industrielle*, of Paris, observes that researches are being prosecuted in that country with a view to discover some simple method of examination, which will serve for the recognition of cast metal. The importance of this question, both from the trading and technical standpoints, is universally recognized wherever people who pay for steel wish to see that they get it; but it is peculiarly pressing in all protectionist countries, where differential duties are imposed on various brands of iron and its varieties.

M. Alfred Evrard, Director of the Firminy Steel Works, has carefully studied the matter, and has presented the results of his observations to the French Society of Mineral Industry. The French Ironmasters' Association admit that the word "steel" is to be attributed not only to products not cast, which take a temper, but also to all cast malleable products, whether they are susceptible of tempering or not. According to this definition, there is no such thing as cast malleable iron. The question resolves itself, therefore, into one of detecting, by some reliable process, the traces of welding in welded products.

A series of striking experiments was conducted with this object at Firminy. A number of lengths of iron and steel wire of different qualities were cut into pieces, reunited, heated together in a forge to a yellow oxidizing temperature, and tempered in cold water. After this operation the wire was heated again to a cherry red, then well hammered, and finally beaten into a flat band of from 0.1 to 0.8 millimeter thick. If, during its handling, the wire cooled, it was reheated. The drawing out accomplished, the portion drawn was again returned to the fire, heated to an oxidizing yellow, at which temperature it was kept for a minute, and then very slowly cooled in the fire. When it became reduced to dark red, the metal was plunged into cold water. The sheets were afterward polished on both sides, a bright finish not being desired, but only so much of the metal removed to obliterate all trace of the oxidation produced by the intense heat. This operation suffices to show the lines of severance of iron in welded samples; but it is insufficient to absolutely distinguish the metal, if produced from blooms.

After being polished, the sheets were dipped in nitric acid, in order to show the grain of the metal under this energetic attack. The result showed that steel has a uniform surface, and preserves a gray appearance; the attack of the acid bit into the metal equally all over the surface. Iron, on the contrary, showed a rough surface, the attack of the acid being very irregular. The metal showed brilliant characteristic grains ranged in longitudinal lines beside other portions showing a gray surface like steel. The "bloomed" iron also showed black bands, due to contained impurities. The welds of mixed irons appeared very prominent. The distinctive character which permits of the recognition of a welded from a cast product is the appearance of a brilliant shining spicule. In the bloomed metal these are very numerous, and form broken longitudinal lines. In fagoted bars these bands follow the welds all along their length. Another experiment conclusively showed that the presence of bright spicule is due to welds.

A number of bars of extra soft cast steel were welded like iron, and afterward drawn out into a sheet, as already described, when not a trace of welding rings appeared until the acid test was applied, which immediately distinguished them by lines of brilliant spicule perfectly separable in appearance from the gray metal in which they appeared. Thus the presence of lines of bright grains in metal is due to welding; they enable us to distinguish clearly between a product welded and a product of casting—that is to say, to distinguish between iron and steel.

Any user of metal can employ the proceeding already described—to roughly polish the surface of a suspected metal (a sample flattened under the hammer, if possible), and test it with acid for bright lines. M. Evrard, however, adds a few remarks on the *rationale* of the process, as carried out at Firminy. The first operation—the tempering of the iron at an oxidizing yellow heat—was to open the welds of the metal. The wires of hard steel broke under this treatment. The second operation the forging of the wires—like the preceding, opened the metal, which, spread into thin sheets, offered a large surface for examination. The third operation—reheating and tempering of the sheets—by keeping the metal at a yellow heat for a certain time, the texture taken by it under the hammer was destroyed, and it was caused to crystallize in large grains. The tempering at dark red rendered the welds visible. For the the fourth operation—the acid test—it is necessary that the samples should be polished on the surface, in order that the test should be equal at all points. The test should also be a severe one; and in order to secure this, the following arrangement might be made: The samples should be placed in a glass jar, partly filled with nitric acid of from 10 to 15° Baume. The attack by the acid is at first very energetic, and after exposure in this way for ten or fifteen minutes, the samples may be withdrawn, washed in water, and immediately wiped dry. The volume of dilute acid should not be too large in comparison with the samples, or it will not rise sufficiently in temperature to act in the strongest possible way upon the metal. These operations require neither laboratory nor skilled operator; they are applicable to all the descriptions of iron or steel samples, from the finest wire to pieces cut from structural bars; and they furnish certain and indisputable results.

Steam at Three Thousand Pounds Pressure.

Jacob Perkins, an American in England, was the father of the high-pressure system of heating by hot water in closed circuits, early gave his attention to the immense power of steam at high pressure for the projection of missiles of war, and so far perfected a steam gun as to exhibit it before the Duke of Wellington in 1824. It was very effective, but the "Iron Duke" considered that a steam boiler that threw away balls as fast as that did would be out of place in an army, and would waste ammunition. From this, steam as a high-pressure power has slumbered, with occasional revivals, for more than a half century.

About 1840 a steam rifle made by Perkins was brought to the United States, and exhibited at New York. It consisted of a steel barrel of medium rifle size, a lever valve, bullet magazine, with a revolving plug arranged for feeding single bullets or a volley. The whole swiveled upon a substantial frame.

The steam generator was of the vertical tubular shape—a strong, wrought-iron, 3-inch tube, within which were eight smaller tubes. The chamber of the large tube was connected with the valve chamber of the gun.

A small hydraulic pump, worked by hand, served to feed the generator with the water required for steam; the whole apparatus being very compact, occupying but a few square feet of floor.

A cast-iron target a hundred feet away completed the plant.

The closed circulation of hot water from the coil in the furnace through the small tubes in the generator carried the pressure up to a thousand and more pounds to the square inch in a few minutes, and would set the safety valve singing in a tone unknown at ordinary pressures. Under this pressure no water issued from the tiny apertures of the gauge cocks; a blue vapor could be discerned, the tone giving the indication of steam or water.

The safety valve upon the generating or circulating coil was set at three thousand pounds to the square inch, and would sometimes blow off when the gun was not in action, or the water low in the generator.

The heat of water in the circulating coil was so great as to immediately blue the surface of the pipe when freshly scraped near its entrance to the generator, and would fire pieces of pine instantly.

The heat of the steam in the gun chamber frequently melted the bullets, and rendered volley firing very difficult; for on more than one occasion the whole volley was melted in the chamber by the sticking of the first bullet. The report from this discharge much resembled that of the ordinary rifle, with perhaps less sharpness.

The bullets fell from the iron target in dust, when thrown at the highest pressure; while from lower pressure they were hattered into all shapes, from cones to flat ragged disks.

A peculiar feature of that high pressure steam apparatus with the necessarily high temperature of its active element was the entire absence of any form of packing; every joint was a metallic contact, and the valves of hardened steel with seats of the hardest bronze.—*Scientific American.*

ALL ABOUT DRILLS.—One of our cotemporaries answers certain questions about drills as follows: What is considered to be the best speed for drills in cast iron, wrought iron, machinery steel and tool steel? A. The speed depends upon the size of the drill and the condition of the material. The fastest speed we ever used was 1,600 revolutions for a drill of No. 18 steel wire. Machinery steel can be drilled at a higher speed than cast iron, wrought iron or tool steel. The question cannot be answered definitely unless the size of the drill and the shape of the drill are given. 2. Does the increase twist of a drill take out the chips faster than the regular twist? A. The gain twist of a drill is an advantage in the rapid removal of chips, especially in wet work—oil or soda water. But the drill should have not only gain twist, but increased width of score, to act well. 2. How much more duty does a twist drill do than the old-fashioned flat drill? A. The twist drill is generally at least twice as effective as the flat drill, requiring less pressure for its work and clearing itself of chips. In some instances it will do fourfold more work than the flat drill.

FATE OF THE IRON RAIL.—The almost complete extinction of the iron rail trade is shown by the enormous fall in the exports of that class of rails. A few years ago, the bulk of the rail exports was declared as iron rails, but the special return issued by the Board of Trade shows that they now form a very small per centage of the total. Only the iron rails manufactured exceeded in quantity the steel rails, but since that time the proportion of the latter has been rapidly increasing four years since.

SCIENTIFIC PROGRESS.

Atmospheric Waves From Krakatoa.

One of the most remarkable facts connected with the great earthquake at Krakatoa was an atmospheric wave which, according to *Nature*, travelled no less than three und a quarter times around the whole circumference of the globe. They were not second waves, but huge aerial, gravity-waves, due to the enormous displacement of air, produced by the ejection of vast volumes of gaseous products into the atmosphere at the time of the volcanic explosion. They were analagous to the great earthquake water-waves that are sometimes transmitted thousands of miles across the widest oceans.

An interesting point in this connection, cited by Prof. John LeConnt, of Berkeley, in a communication to *Science*, of June 13th, and one which he says needs elucidation "is the fact, established by the observations of Gen. Strachey, Prof. Forster, and others, that the velocity of these waves was approximately the same as that of an elastic sound-wave in air. It is the near coincidence of these velocities which has led to the confounding of these gravity-waves with elastic sound-waves. The approximate identity of the velocities in these two cases may be traced to the relation existing between the elasticity or resilience of the air, on which the velocity of sound depends, and the hight of a homogenous atmosphere, on which the velocity of long aerial gravity-waves depends.

It is well known that the mathematical investigations of Sir G. B. Airy and others, confirmed by the experimental results of Scott Russell, show, that, in the class of water-waves in which the wave-length bears a large ratio to the mean depth of the water, the velocity of propagation of the wave is sensibly equal to the velocity acquired by a heavy body in falling vertically *in vacuo*, under the action of gravity, through half the mean depth of the water. Now, it is highly probable, that, notwithstanding the variable density of the atmosphere with altitude above the surface of the earth, the same formula is applicable to long gravity-waves propagated in it; viz., that the velocity of the wave is equal to that which a heavy body would require in falling vertically through half the hight of a homogeneous atmosphere.

The same number of *Science* contains a lengthy extract from the log of a ship which was sailing in close proximity to the scene of the earthquake on the day of its occurrence. The following condensation will be of interest:

Aug. 27.—Commences with strong breezes, and thick, cloudy weather. Barometer 30.12. At 9.30 A. M. pilot left ship. Hove the lead every fifteen minutes. At daylight noticed a heavy bank to the westward, which continued to rise; and, the sun becoming obscured, it commenced to grow dark. The barometer fell suddenly to 29.50, and suddenly rose to 30.60. Called all hands, furled everything securely, and let go the port anchor with all the chain in the locker. By this time the squall struck us with terrific force, and we let go starboard anchor with eighty fathoms chain. With the squall came a heavy shower of ashes and sand, and it had become by this time darker than the darkest night. The barometer continued to rise and fall an inch at a time. The wind was blowing a hurricane, but the water kept very smooth. A heavy rumbling with reports like thunder, was heard continually; and the sky was lit up with fork lightning running in all directions, while a strong smell of sulphur pervaded the air, making it difficult to breathe. Altogether, it formed one of the wildest and most awful scenes imaginable. The whole ship, rigging and masts, were covered with sand and ashes to the depth of several inches.

Aug. 28.—Commences with light airs, and thick, smoky weather. Hove up starboard anchor, and hove short on port anchor. Dead calm throughout the day and night. Saw large quantities of trees and dead fishes floating by with the tide; the water having a whitish appearance, and covered with ashes. This day ends with a dead calm, and thick, smoky weather.

Aug. 29.—This day commences with calms, and thick, smoky weather. Made all sail throughout the day. Moderate winds, and thick, smoky weather. Passed large quantities of driftwood, cocoanuts and dead fishes. At 8 P. M. passed Anjier [all of which, except the foundation of the lighthouse, was destroyed by the tidal wave], and could see no light in the lighthouse, and no signs of life on shore. Furled all light sails, and stood under easy sail throughout the night.

Aug. 30.—Commences with moderate winds and cloudy weather. At daylight made all sail with a fresh breeze from the westward. Found the water for miles filled with large trees and driftwood, it being almost impossible to steer clear of them. Also passed large numbers of dead bodies and fish. Kept a sharp lookout on the forecastle throughout the day.

CAUSE OF EARTHQUAKES.—Dauhree, in discussing the recent earthquakes in Europe and Asia, presents many objections to the theory of falling rocks in internal chasms, and thinks that all the phenomena can be satisfactorily explained by the action of superheated steam. He refers to the well-known craters of explosion, such as Lake Pavin, in Auvergne, where the stratified rocks have been cut sharply through, as if by a punch. The modern experiments with gun cotton, nitro-glycerine and dynamite have often shown pressures of more than 6,000 atmospheres, and produced results which could hardly be wrought by the pressure of weights 600,000 times as great as that of the explosives. Superheated steam, when set in movement by such simple mechanism as nature often presents, would account for all the action of earthquakes, their violence, their frequent succession, and their recurrence in the same regions for many centuries. It also explains the predilection of earthquakes for regions where there are numerous faults, especially if the dislocations are recent. Earthquakes appear to be, in many instances, like subterranean volcanic eruptions which are smothered because they find no outlets. The motive power of gases, of which we see the gigantic effects in the solar jets or protuberances, appears also to be considerable enough beneath the surface of our planet to explain all the effects of earthquakes. *Comptes Rendus.*

Louis Pasteur's Discoveries.

One of the most renowned of modern investigators is Pasteur, the French scientist. He has made many important discoveries of the germs of disease, which have been reported from time to time. These discoveries have been reported at length not only in the scientific papers, but in the newspapers of the day. Pasteur's latest discovery is that of a cure for hydrophobia. On the 19th ultimo, he read at the Paris Academy of sciences his report on his four years' experimental studies on hydrophobia, and the means, not of eradicating, but of weakening it. He admits that the microbe causing it has not been discovered, though he is sure of its existence, and that it may become again rebellious after it has been transmitted to an organism more favorable to its growth. Thus the virus inoculated from an ass to a rabbit will not kill the latter, but if passed on to another rabbit, and then to dog or man, will be fatal. He observed that in some animals the virus lost, and in others gained force. In the rabbit its power was most visible, whereas the ape was less terribly affected. It therefore occurred to Pasteur that if virus were transmitted from one ape to another it would grow weaker at each inoculation. He took some from a dog's brain and inoculated an ape, which died from its rabid virus. He inoculated a second, and then a third, which was hardly indisposed. The virus so modified was transmitted to a rabbit, in whose body it recovered some strength. It increased in morbid power in a second and third rabbit, and attained the maximum in the fourth. It would thus be seen that virulence was only kept in check by withholding from it good conditions for growth. It would be also seen that it never recovered, when well tamed, its pristine deadliness in a single hound. Pasteur claimed to so completely tame the virus that a dog would, in being rendered refractory to rabies by hypodermic inoculation or trepanning, show no sign of illness.

In the second part of his report, Pasteur explained how the maximum of virulence was certainly attained, by making several guinea-pigs the mediums between rabbits and dogs. He told the academy he had discovered a process by which he can operate with diseased blood on healthy blood, and claims to be able to check the progress of rabies in freshly-bitten dogs or other animals. He asks the academy and the Minister of Public Instruction to appoint a committee to study his proof experiments.

Solar Explosions.

Faye rejects, as fabulous, the velocities of 100 or 150 leagues per second, which seem to be indicated, at the sun's surface, by the prodigious rapidity with which the protuberances are formed, and the partial displacements which are observed in the hydrogen lines. He suggests the great probability that hydrogen, when escaping rapidly into the rare medium which surrounds the photosphere, is at first chilled, on account of its enormous dilatation, and becomes invisible to the spectroscope. Afterwards, under the action of solar radiation, it is reheated in various places, so as to be seen by our instruments. An observer, who should return after a half hour's interval, to contemplate the phenomenon, would find the protuberances wonderfully enlarged, without the hydrogen having been required to transverse enormous spaces in the meanwhile.

Father Seechi saw small isolated clouds, forming and growing simultaneously without visible connection with the chromosphere, apparently in the same way as the clouds which are formed in our own atmosphere, from the vapor which already exists in the air, but which is latent and remains invisible, until a local cooling, or a change of pressure, determines its condensation.

Thollon contends, however, that the velocities which are indicated by each of these phenomena are quantities of the same order, and that their maximum value corresponds to the cometary velocities in the same region. Every movement of luminous matter, which approaches us or recedes from us, undoubtedly produces a displacement of spectral lines. No theory indicates, and no fact demonstrates, that any other cause is fitted for producing the same effect. It is, therefore, very natural to consider such displacement as an indication of movement.

Passing Events.

This issue of the MINING AND SCIENTIFIC PRESS is the first one of Volume XLIX, which is a first-rate time to renew old subscriptions and send in new ones.

The colliery disaster at British Columbia, an account of which is given elsewhere, is one of those things from which we have been remarkably free on this coast, but the opening of new collieries and extension of deeper workings in old ones will no douht cause them to occur more frequently in the future. It behooves colliery owners on this coast to take advantage of the experience of older coal mining regions and adopt all possible safeguards against accident.

The National Holiday occurring this week has caused a temporary cessation of business, the banks, wholesale houses, Board of Brokers, and many retail establishments closing business for the three consecutive days at the end of the week.

There is little of special interest to note from the mining regions, other than the current news condensed in our "Mining Summary."

SINGULAR CLOUD PHENOMENON.—A singular phenomenon was observed at Bismarck, D. T., last week. There were two clouds, ons above the other. A heavy shower was seen to pour from the upper one, and the cloud below caught every drop of water and absorbed it. Light clouds seemed to come from all directions to catch the shower. The color of the lower cloud changed rapidly, and it expanded from a small summer cloud to a massive rain gatherer. In a few minutes, the upper cloud had entirely disappeared. This was observed through glasses.

Sulphureted Ore for Acid Making.

Since the introduction of our pyrites as a substitute for brimstone in the manufacture of sulphuric acid, the roasting of sulphureted ores in kilns has attained a degree of perfection that its importance warrants. In the large copper works of both England and Germany the possibility of the continuous roasting of matte in kilns has also been demonstrated, but this is dons rather to prevent the destructive influence of sulphurous acid on the surrounding vegetation than with any view of economical roasting, as it is only hy the exercise of the very greatest care and skill that it is possible to keep up a sufficiently lively state of combustion to generate sulphurous acid in large quantities without fusing the whole contsnts of the kiln iuto one solid canker. The kilns may here he considered merely as an apparatus for the desulphurization of *ores*, and as every manager of copper or acid works receives ores and inquiries regarding its fitness for sulphuric acid manufacture, most of the inquiries showing ignorance of the quality of pyrites wanted by acid makers, a few words in this connection will be of interest.

Quantity is the first desideratum. Unless a deposit is of immense size and very accessible, it has uo chance of competing with cheap and good Canadian pyrites, which now nearly controls ths Eastern market. A high percentage of sulphur is also requisite. Forty per cent is a minimum, and ore carrying 45 per cent would possess nearly douhle the value. To contain such an amount of sulphur it must also be free frou gaugue rock. Purity must also be considered. Any appreciable amount of arsenic will condemn pyrites for snlphuric acid manufacture, and admixtures of lead and zinc are more or less deleterious.

The percentage of copper in the pyrites is also highly important. Mr. Edward D. Peters, in an articls in a Government report on this suhject, states that while it is commercially advantageous to have as high a percentage of copper as possible, yet in practice anything over 5 per cent would probahly condemn the ore for the manufacture of acid. It is not alone that the substitution of copper pyrites for irou lowers the sulphur contents of the ore (the latter mineral containing nearly 20 per cent more sulphur than the former), but it also affects the working of tbe burners, and, owing to its fusi bility, greatly increases the difficulty of working.

This is a point particularly wortby of notice. Five per cent of copper is the extreme limit, and three or four psr cent makes it better oro for burning. Mr. Peters calls attention to a very great error often committed, which is attempting to use the mineral known as phyrrhotite or magnetic pyrites in place of the ordinary pyrite or iron pyrites. The difference in behavior of these two minerals in the burners is not alone due to the smaller percentags of sulphur contained in the phyrrhotite, (36 as against 53) hut also from the fact that the pyrite yields up what snlphur it contains with great ease, even if it is so impure as to carry less sulph ur than the pyrrhotite, and burns freely in kilns without going out or melting. The other mineral on the contrary, either scorches on the surface, and thengoes out entirely, or escapes control and melts into a solid mass. Inexperienced persons should not attempt to work this ore. Roasting pyritous ores in kilns helongs to the subject of manufacture of sulphuric acid. The capacity of a single hurner rarely reaches half a ton in 24 hours. Their management requires skill and their coustruction is expensive. On the other hand they work with much less mechanical loss than is experienced in heap washing, and there is no tying up of capital in a two or three months supply of ore.

REV. JOHN I. BLEASDALE died in this city on Saturday. He was a doctor of divinity, having worn his robes at Sydney, in New South Wales. But it was as a chemist that he was best known in this community. He was a man of profound learning and one of the best analytical chemists in the country, and being an enthusiast upon the subject of viticulture and wine-growing, made these his principal studies. He was also a microscopist and had written several treatises, one on gems and precious stones, being particularly notable.

THE Sierra Nevada Company reports a cash balance of $69,441 93, or about two-thirds of what the stock is selling for.

Coal at San Francisco.

There can he no stronger indication of prosperity, evidencing an increass of population and an enlargement of our manufactories, than the fact that our local consumption of coal for the last half year has increased 96,000 tons.

Importers of foreign coals give a doleful account of their imports so far in 1884, they having been singularly unprofitable. Large numhers of English and Australian cargoes, shipped in December and January last, have since arrived here, and were disposed of at from $3,000 to $5,000 per cargo loss. A valid reason can he assigned for these seeming ill-timed shipments. Our rainfall to January 1, 1884, had not reached 4½ inches—a strong prediction for a dry season, which would have insured high quotations for coal; instead, we have had an exceptionally seasonahle rainfall, guarantceing us a large influx of vessels to move our crops, most of which will be coal carriers. Then again, a colliery in Nanaimo, British Columbia, which in 1883 did not ship us auy coal, has so far yielded us 45,240 tons, of an excelleut grade for gas and steam purposes, since January 1st, and the Tacoma and Seattle collieries havs shipped us 50,000 tons in excess of same period of 1883, thus overcoming our increased consumption, and serving to keep the market depressed.

Mr. J. W. Harrison, coal and metal broker of this city, gives in his circular review for the half year the following statistics. The first table is one of prices, which will show the monthly fluctuations of foreign coal for "spot" cargoes.

	Jan.	Feb.	Mar.	Apr.	May.	June.
Australian..	$8 50	$8 25	$8 00	$7 25	$7 12½	$7 25
English steam..	8 00	8 00	8 00	7 00	7 00	7 00
Scotch splint...	9 25	9 00	9 00	8 50	8 00	8 00
West Hartley...	9 50	9 25	9 25	9 00	8 25	8 25
Cardiff.....	8 00	8 00	8 00	7 50	7 25	7 25

There is a better feeling apparent in the quotations made for foreign grades last month, showing an advance of fully 75 cents per ton on some grades over the lowest prices of April and May. As some cargoes of Australian sold under $6 75 per ton, which could now be readily placed at $7 50, and as all the Australian to arrive here within 90 days has already been placed, any change of figures will be an advance within the next three to four months.

The various sources from which we have derived our supplies are as follows:

		1883.	1884.
British Columbia.....	tons.	63,524	111,571
Australia.....		10,511	49,346
England and Wales.....		37,806	37,303
Scotland.....		3,914	5,540
East (Cumberland and Anthracite)..		24,713	16,445
Seattle.....		18,000	65,318
Carbon Hill.....		16,600	74,835
Mount Diablo.....		55,181	38,118
Renton, Coos Bay, South Prairie.....		20,594	37,596
Totals.....		340,846	439,311

The arrivals at Wilmington have been 30,924 tons—20,775 tons Wellington, 8,802 tons Carbon Hill, and 1,347 tons Wallsend.

The outlook is very encouraging for a further increase of consumption during the next six months, as the winter season interveues, causing large sales of coal for domestic purposes, and it is safs to predict that present prices will be fully sustained.

A BIG MINING SALE.—The Reno *Gazette* says: "J. W. E. Townsend received a letter from John I. Ginn, in which he says that Kemp & Butterfield have sold a group of mines in Mill Creek for $1,500,000. They have raised a working fund of $300,000. Mr. Butterfield is to act as superintendent. He also says the tunnel has entered the Sheepherder lode, but the public is not informed of the result."

DURING the past month local incorporations disbursed $336,326 in dividends, as follows: Banks $5,000, gas and water $46,000, insurance $9,000, street railroads $19,500, powder $22,760, mining $204,716 and miscellaneous $29,350. The total for a corresponding month in 1883 was $223,250.

HALE & NORCROSS has about $60,000 on hand in cash, besides the hullion sent to the Carson Mint—value not yet known. Savage has nearly $34,000 on hand, Chollar $25,000 on hand, and Potosi, which is overdrawn about $1,000 at hank, has $19,000 to be collected on the assessment.

THE miners who appropriated rich ore at the Buchanan mine, Tuolumne county, have been sent to the State Prison—one for five and the other for eight years. This example should be a warning to miners not to carry off ore from their employers.

OPHIR is in good financial condition, with $63,702 87 in the treasury.

Patriotism and its Duties.

The annual recurrence of the Fourth of July, carries our minds hack to that hour, when was first deliberately and formally announced the gospel of political liberty. Then hegun the momentous experiment, how far life, liberty, and happiness could be secure under laws made hy those, who were to obey them. Then was ushered among the family of nations a new government destined, soon after the revolutionary struggle had ceased, to crystallize into a constitution, whose central idea is the political equality of all the citizens before the law. Our readers will hardly expect us to lift the veil of time, and bid them look on the sublime spectacle of two millions of people, moved with one accord to assert their rights against the most powerful nation in the world, and following their new-made flag with unshaken confidence, under varying fortunes over many a bloody field, until victory crowned their efforts. The most grateful contribution we can make to their memory, is to be so deeply imbued with their spirit and wisdom, as to know how to perceive and discharge our duty in th spresent, and pass down to posterity the legacy they have left us unimpaired.

In the light of this day, some thoughts on patriotism and the duties it inculcates may not he inappropriate.

What is patriotism? What is American patriotism as distinguished from the patriotic sentiment that glows and animates the bosom of all other people? It is a feeling that should not he confounded, as is often done, with that sentimental instinct, born of association and which hinds one to his native land. Providence has for wise and beneficent reasons imperishahly planted in the bosom of every child a love of home, however homely and unattractive it may be, It had rather live with its own parents in a wood-shed, clad in rags and pinched in hunger, than share the hospitality of strangers as an orphan, though surrounded by all the luxury and elegance that wealth can procure. There is akin to this beautiful filial emotion, an instinctive attachment to the land of our birth, that geographical locality we call our country. It is a sentiment not born of genial skies and fertile acres.

But this beautiful feeling, so often the inspiration of poetry and song, is not the patriotism that should fill our hsarts as we recall the historic memories of this day. It is a feeling shared alike hy the Piute or Dakota Indian for his hunting ground. The patriotism that fired the souls of the Hamdens, Koscinskos, Emmets and Franklins—what was it? A blind instinct which clings to a tree that may have happened to overshadow one's birth-place? Was it for the love of the granite hills of Massachusetts that Warren panted out his life on the hight of Bunker Hill, or that caused the elder Adam to exclaim, as he heard the report of the musketry at Concord and Lexington, "Oh, what a glorious morning is this?" Did Washington draw his sword for the tobacco fields of Virginia, or Marion and Sumptor hide in swamps and live on sweet potatoes for the love of the palmetto groves of Carolina? The inspiration that fired their souls was something purer, deeper, nobler than the brute instinct that attaches one to his native soil.

Indeed, American patriotism is a noble sentiment, that may catch and hurn in the hosom of a man of foreign birth. When the Marquis De Lafayette tendered his sword and fortune to the Colonial Congress, and Baron De Kalb fought and died on the plain of Camden, did they not feel an enthusiasm akin to that which animated the soul of Washington, Hancock and Adams? During our late unhappy civil strife thousands of our forcign population freely left their shops, fields and homes to enlist in our armies, and vied with the native-born in zeal, heroism and loyalty. What was it that inspired them? It is happily expressed by Mr. Lincoln, in his address at Gettysburg, when he said: "Our fathers brought forth upon this continent a new nation, conceived in liberty and dedicated to the proposition that all men are created equal." Patriotism—American patriotism—is an ardent devotion to that idea, to that special system of government by which we are trying to work out the destiny of a mighty people.

THE corrected assessment-roll of San Francisco personal property shows a reduction of $549,455 from the Assessor's figures, making the total suhject to assessment $58,848,832, instead of $59,398,287.

Competitive Trial of Windmills.

Hydraulic engineers and manufacturers of windmills and force pumps will be interested in the proposed competitive trial of windmills, constructed for agricultural purposes, which will be held during the 30th annual exhibition of the Pennsylvania Agricultural Society, at the new State Fair grounds in Philadelphia, September 8th to 20th, inclusive. There are very many forms of windmills, differing in form and arrangements.

That valuable practical information may be gained upon the application of the true principles which govern the construction of such machines, and that the general efficiency of all may be materially improved, the Society invites all manufacturers of windmills to make entries for exhibition and trial, and of lift and force pumps to make full exhibits. A description of mill, including weight of wheel, traverse sweep of wheel and vane, diameter of turn-table, an account of all other appliances sent to be used in the trial, the derrick alone excepted, and the price at which the machine is sold, must accompany the entry.

Mills may be erected at any time after August 1st. They must be in complete running order, and be turned over to the society for preliminary examination and test on the first day of September, at 12 o'clock, noon. The actual trial to begin at 12 o'clock, noon, September 8th.

No mills shall exceed ten feet in diameter from out to out of wings, and all parts and appliances shall be guaranteed by exhibitors to be in all respects exactly similar to those sold in their everyday business, and at the prices named.

Each exhibitor shall erect a derrick to support his mill, the centre of the crank-shaft of which shall be thirty-five feet above the fixed level of water in the supply tank at foot of derrick. The society will furnish free of charge to each exhibitor a uniform style of water-meter, and will require all water to be pumped through it: the outlet of the meter to be twenty-five feet above the level of the water in the supply tank at foot of derrick. The water as it issues from the pump to flow back in full view to the supply tank. The return of the water may be made in such attractive forms as the taste of the exhibitor shall dictate. Mills may be furnished with such automatic appliances and with any kind or style of pump, which the exhibitor shall prefer to provide. When turned over to the committee, the derrick will be boarded up, and all parts of the mill rendered inaccessible, and no part of the mill or its connections can be oiled, packed, or touched in any way or under any pretense whatever, until the conclusion of the twelve days trial. The register of the water-meters will be taken by the judges at the commencement of the trial and daily thereafter, at a fixed hour, until the test shall close at noon on the twentieth day of September. During the period of trial the average velocity of the wind for the twenty-four hours preceding noon of each day will be furnished by the United States Signal Observer. These reports will be posted daily, as also a report of the number of revolutions made by each mill, which records will be taken by apparatus supplied by the Society and affixed to each mill.

At the conclusion of the trial, the judges will make a comprehensive report, stating to what manufacturers invitations to compete were sent, what entries were made, and mills were erected for trial. In the order in which the entries were received, description of each mill with illustrations if furnished, will be given. Also a statement of the number of revolutions of the wheel, mechanical condition of the parts, kind of pump used, number of gallons pumped, and such other items of interest as may be deemed worthy of note. No special references commendatory or deprecatory of any one mill will be made, the report dealing with results alone.

No premiums of money, medals or diplomas are offered. Awards will be in the form of written reports attested by the signatures of the judges. California is a great country for windmills, and no doubt several of our inventors will wish to compete in this trial.

THE San Francisco License Collector reports expenses for June, 1884, at $29,339.90, as against $26,500 for June, 1883; receipts for 1883-84, $446,537.05, as against $416,593.75 for 1882-83. An additional $3,854.70 has been received for the State Mining Bureau.

Measurement and Flow of Water in Ditches.

[Read before the Technical Society of the Pacific Coast, June, 1884, by ARTHUR J. BOWIE, JR.]

In California, where the rainfall over large portions of the State is small and periods of drought of not uncommon occurrence, the development of the agricultural as well as the mining interests, necessarily resulting from the continued influx of population, will be dependent greatly upon the careful husbanding of the water supply. The sources of this supply are comparatively limited, and the problem of systematic irrigation will grow daily in importance from the necessities of the farmers; and the demand for water will steadily increase with the more extended cultivation of the soil.

The costs of construction and maintenance of the necessary canals and ditches (depending principally on their capacity) will be of prime importance to the owners, who will appreciate fully the value of a correct determination of the flow of water. The easy-going farmer who purchases the water, will ultimately discover the necessity of knowing how much he is receiving, and then will come the demand for a standard of measurement of water.

The history of northern Italy from the fourteenth to the eighteenth century, is replete with accounts of disputes and difficulties arising from the non-existence of some accepted standard of measurement of water. Similar troubles have arised at times in the mining regions of this country, as can be attested by numerous court reports.

With the experiences of the past, and in consideration of the future interests of the country, it would seem advisable that some uniform gauge and standard of measurement of water should be adopted.

The miner's inch has only led to confusion and is the relict of the Mexican and Spaniard, who possibly took it from the Italian. Like the Italian oncia, which varied in nearly every province, so its brother, the miner's inch has followed suit to even varying in the same district.

In the construction of the various water supply systems for the different placer regions in this State, certain experience in the measurement and flow of water has been acquired, and it has been considered of sufficient import to place some of the results of this work on record, with a view of assisting in clearing up the miner's inch, and giving to those interested in the profession the benefits derived from the several works.

The Miner's Inch.

The miner's inch of water is a quantity which varies in almost every district in the State; no one gauge has been uniformly adopted, nor has any established pressure been agreed on, under which the water shall be measured. In some counties there are 10, 11 or 12 hour inches, and in others there is a 24 hour inch. The apertures through which the water is measured are generally rectangular, but vary greatly in width and length, being from 1 to 12 inches wide and from a few inches to several feet long. The discharges are through 1', 1½' 2', and 3 inch planks, with square or with square and chamfered edges, combined or not, as the case may be. The bottoms of the openings are sometimes flush with the bottoms of the boxes, sometimes raised above them. The head may denote the distance above the center of the aperture, or again that above the top, and varies from 4½ inches to 12 inches above the center of the aperture.

The Smartsville inch is calculated from a discharge through a four-inch orifice with a seven inch board top; that is to say, the head is seven inches above the opening, or nine inches above the center. The bottom of the aperture is on a level with the bottom of the box, and the board which regulates the pressure is a plank one inch thick and seven inches deep. Thus, an opening 250 inches long and four inches wide, with a pressure of seven inches above the top of the orifice, will discharge 1,000 Smartsville miner's inches. Each square inch of the opening will discharge 1.76 cubic feet per minute, which approximates the discharge per inch of a two-inch orifice through a three-inch plank with a head of nine inches above the center of the opening, the said discharge being 1.78 cubic feet per minute. The Smartsville miner's inch will discharge 2,534.40 feet in twenty-four hours, though in that district the inch is only reckoned for eleven hours.

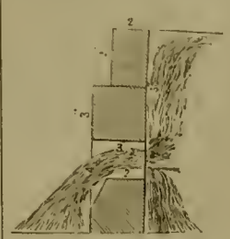

Fig. 1.—Miner's Inch.

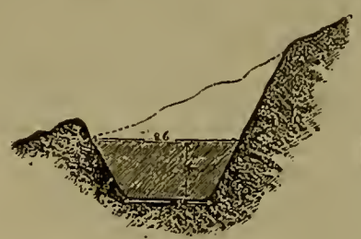

Fig. 2.—North Bloomfield Main Ditch.

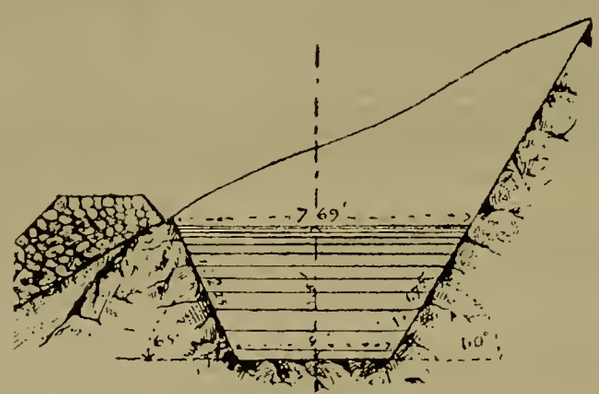

Fig. 3.—Section of Milton Ditch.

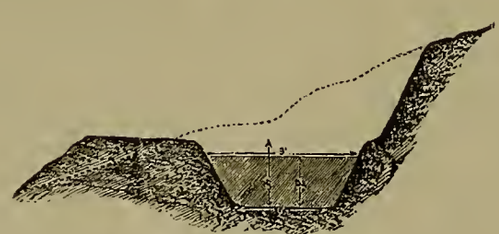

Fig. 4.—Section of La Grange Ditch.

Other Inches.

The miner's inch of the Park Canal and Mining Company, in El Dorado county, discharges 1.39 (*a*) cubic feet of water per minute. The The inch of the South Yuba Canal Company is computed from a discharge through a 2-inch aperture over a 1½-inch plank with a head of 6 inches above the center of the orifice.

At the North Bloomfield, Milton and La Grange mines the inch has been calculated from a discharge through an opening 50 inches long and 2 inches wide, through a 3-inch plank (outer inch chamfered), with the water 7 inches above the center of the opening.

Determination of the Inch Experiments at Columbia Hill.

To determine the value of this miner's inch, a series of experiments was made at Columbia Hill, latitude 39 N., elevation 2,900 feet above the sea level. The *module* used was a rectangular slit 50 inches long and 2 inches wide; head 7 inches above the center of the opening. The discharge was over a 3-inch plank, the outer inch chamfered, as shown in Fig. 1.

The size of the opening was taken with a measure (micrometer attached) which had been compared with and adjusted to a standard United States yard. Time was read to one fifth of a second; the level of the water (drawn from a large reservoir) was determined with Boyden's hook, micrometer adjustment. The following results were obtained:

One miner's inch will discharge in 1 sec.,	.026 cub. ft.
One miner's inch will discharge in 1 min.,	1.57 cub. ft.
One miner's inch will discharge in 1 hour,	94.2 cub. ft.
One miner's inch will discharge in 24 hrs.,	2,260.8 cub. ft.

The coefficient of efflux is 61.6 per cent. These figures are within the limit of 1-500 possible error (*b*).

As the 2-inch aperture requires too much space for gauging large quantities of water, custom has changed the form of the module, and an aperture 12 inches high by 12¾ inches wide, through a 1½-inch plank, with a head of 6 inches above the top of the discbarge, is now used. These openings discharge what is accepted as 200 miner's inches.

A series of experiments was made at La Grange, Stanislaus county, California, latitude 37° 41' N., elevation 216 feet above the level of the sea, to determine the value of the inch thus delivered in the claims. The results here given are the mean of a series of gaugings taken from 9 different apertures, discharging in the aggregate 1,800 miner's inches.

The water was drawn directly from a flume and discharged into a small reservoir, across the lower end of which was fitted a gauge. The velocity of the water issuing from the flume was broken by several drops as it entered the reservoir, and the gauge at the lower end was raised sufficiently to prevent any flow due to an increased velocity which might have been acquired in the flume.

The level of the water was determined with a Boyden's hook.

The discharge from the module was caught in a flume and conducted to a box fitted and leveled for the purpose. Time was read to one-fifth of a second. The following results were obtained:

One miner's inch discharged in 1 sec.,	.02499 cubic ft.
One miner's inch discharged in 1 min.	1.4994 cubic ft.
One miner's inch discharged in 1 hour	89.9640 cubic ft.
One miner's inch discharged in 24 hrs.	2,159.1460 cubic ft.

Effective coefficient of efflux, 59.05 per cent (*c*).

An experiment on a single aperture of this form, made by Hamilton Smith, Jr., gave a discharge of 2,179.4 cubic feet per miner's inch in 24 hours. The 2,230 cubic feet of the North Bloomfield inch can only be considered an assumed rough estimate of discharge in 24 hours for 1 miner's inch.

The theoretical velocity in feet per second of a fluid flowing into the air through openings in the bottoms or sides of a vessel or reservoir, the surface level of which is kept constantly at the same hight, is equal to that which a heavy body would acquire in falling through a space equal to the depth of the opening below the surface of the fluid, and is expressed as follows:

$$v = \sqrt{2gh}.$$

In which v = velocity in feet per second.
g = the acceleration of gravity.
h = the hight fallen in feet.

This is called Torricelli's theorem, which supposes indefinitely small orifices with thin sides,

---

(*a*) Estimated by J. J. Crawford, M. E. (*b*) The experiments were made in 1874, by H. Smith, Jr., C. E.
(*c*) The experiments were made by the author.

and assumes that the upper surface of the water and the orifices are under the same conditions as regards atmospheric pressure. Conditions and size of sectional area of the aperture, friction, resistance of the air to motion and pressure of the atmosphere, are all neglected.

The value of g varies in different latitudes, but for all practical purposes is taken as equal to 32.2.

$$\text{The theoretical head} = \frac{v^2}{2g}$$

The acceleration of gravity at latitude 45° = 32.17 feet per second, being represented by g, for any other latitude, l.

$$g' = g\ (1 - O.\ 002588\ \cos 2l)\ (d).$$

If g represents the acceleration of gravity at that hight, h and r the radius of the earth, the acceleration of gravity at the level of the sea equals—

$$g' = g\left(1 + \frac{5h}{4r}\right)$$

Flow of Water in Open Channels.

There is no generally accepted formula for determining the velocity of water in open channels. The tables based on the old formulas published prior to the works of D'Arcy and Bazin in France, and of Humphreys and Abbot in the United States, being founded on data which ignore the important factor of the nature of the bed and the sides of the channel, have proved unsatisfactory. Hydraulic engineers have been compelled to rely for correctness of calculated result on the application of a combination of a few known laws with experimental data, which latter, though all important, have been too restricted for the deduction of reliable mathematical theory.

The formulas, in terms of dimensions of cross section and slope, are based upon the supposition of either "permanent" or "uniform" motion. Permanent motion approaches the condition of streams, permits changes of cross section and slope of the water surface, excepting sudden bends, causing eddies and undulations, but demands that the discharge from the different sections should be identical. Uniform motion, in addition, requires an invariable cross section and constant slope of the fluid-surface. The general formulas based on permanent motion differ from those restricted to uniform motion, "by taking into account changes of living force produced by changes of cross section at the different points" (*e*). If these variations are unknown, the difference between the formulas disappears.

Chezy considered that the resistances encountered by water in uniform motion were in direct proportion to the length of the wetted perimeter to the length of the channel and to the square of the mean velocity, from which he deduced the formula.

$$v = c\sqrt{rs}.$$

v Is the mean velocity in feet per second.

c A coefficient taken at a constant value.

r The mean hydraulic radius in feet.

s The fall of surface in a unit of length.

The equation indicates the relation of the mean velocity to the slope and the mean hydraulic radius. The value of the coefficient c has been demonstrated empirically to have a wide range. This formula, however, has been considered the simplest, and has been used by many engineers, different values being given to c, varying from 84 to 100 for large streams. "Though there is abundant evidence," says Higham (p. 5), "that the latter is much too high for low values of r in earthen channels, and that 100 is too low for very large rivers, as high a value as 254.4 having been deduced from the Mississippi observations."

D'Arcy and Bazin, by their experiments on channels of moderate section with limited variation of grades, proved that the coefficient c involved not only r and s, but also a constant for the different degrees of roughness of the channel, the formula being applicable within certain limits of inclination and values of r.

Humphreys and Abbot make the velocity vary with the fourth root of the inclination, while Hagan assumes the velocity to vary with the sixth root.

Ganguillet and Kutter considered that the Chezy formula, $v = c\sqrt{rs}$, was the correct point of departure, but that the coefficient should be made variable, involving not only r and s, but likewise the degree of roughness in the bed or channel.

Ditches in California.

In the mining districts of California ditches are constructed boldly with steep grades and on irregular lines with numerous sharp curves. The cross sections, originally uniform, become more or less varied. Absorption, percolation, evaporation and leakage reduce the flow. A distinct reliable factor for each of these sources of loss cannot well be incorporated in the coefficient of the discharge. If, then, it is intended to cover all of these common sources of loss by such a coefficient, its value must be a material modification of values given commonly in the text-books. It would be certainly an affectation of accuracy to apply so complicated a formula as that of Kutter in such a case, since the modifying conditions which can be estimated but roughly, call for a large reduction of the calculated result. This will be apparent from the measurements of discharge given further on. The simple formula, $Q = a\,c\sqrt{rs}$, expresses more fitly the result of experience in such cases, wherein—

Q is the quantity of water which the ditch is capable of carrying in cubic feet per second.

a The effective area of cross section of ditch as constructed originally, in square feet.

r The hydraulic mean depth in feet.

s The fall of surface in a unit of length.

c A coefficient covering all common losses.

Examples of Value of Coefficient in Ditches.

In its application to the North Bloomfield Main Ditch (*f*) (length 40 miles, sectional area 23.89 square feet, grade 16 feet per mile), with its abrupt turns and sinuous course, the value of the coefficient c, as determined, varies from 44.7 to 37.7, in accordance with the season of the year.

The Texas Creek (*g*) branch ditch is about seven-tenths of a mile long. Its sectional area is 13.5 feet, and the grade is 20 feet per mile. The sides are rough and the curves are sharp. With a flow of 32.8 cubic feet per second, the ditch runs about full. The value of $c = 33$. In connection with this ditch there is a rectangular flume 2'.67 wide x 2'.83 deep, made of unplaned boards, set on a grade of 32 feet per mile. The flume has some sharp but regular curves, and the water from the ditch runs it nearly full at these points. With the discharge 32.8 cubic feet per second, $c = 39$.

On the Milton line, from Milton to Eureka, a distance of 19.4 miles, the sectional area of the ditch is 20.39 square feet; grade 19.2 feet per mile for the earthwork and 32 feet per mile for flume. The line is very irregular, having many drops and chutes. The distance from Milton to the measuring box at Bloody Run is 29½ miles. The minimum established grade for the last 10.1 miles was 16 feet per mile, with a sectional area for the ditch of 23.05 square feet. The coefficient c determined from the gauging at the measuring box has varied from 22 in its leakiest condition to 31, which latter can be taken as correct for the present condition. In the succeeding 30 miles below the gauge, owing to a better character of ground, the coefficient reaches 41.

The La Grange main ditch, 17 miles long, has a sectional area of 22.5 square feet, and a slope of 7 feet per mile. From the delivery at its Patricksville junction the coefficient c is determined to be 52, but it is based upon the assumption that the depth of the canal is three feet, whereas in the original construction it was supposed to have been made four feet deep; the discharge, therefore, due to such a sectional area would diminish necessarily the ascribed value of c (*h*).

In all these canals, after the artificial banks are well consolidated, the water area is increased beyond the original excavation in the natural ground.

Accuracy cannot be expected in calculating the values of Q for proposed ditches of such character. Important losses must vary in every ditch, depending on the nature of the ground, and the character of the construction of the work, and the season of the year. The feeders along the lines compensate largely for these losses. In order to be safe in estimating the capacity of a ditch, the value of the coefficient c for the dry season should be taken.

The following facts show the magnitude of the losses due to the absorption, leakage, evaporation, etc.:

Three thousand miner's inches of water (a flow of 75 cubic feet per second) turned in during the busy season at the head of the Bloomfield ditch, will deliver 2700 inches (67.5 cubic feet per second) at the gauge 40 miles distant. Twenty-four hundred inches of water (60 cubic feet per second) turned in at the head of the Milton ditch delivered formerly at the gauge, 29½ miles distant, 1450 to 1600 inches (36.25 to 40 cubic feet per second) but at present 2500 inches (62.5 cubic feet per second) turned into the head of the ditch, delivers 2,000 inches (50 cubic feet per second) at the gauge. The exact loss of water between the head of this ditch and the measuring box is shown in the following summary, taken from the official records for the month of August for the years 1875 to 1882, inclusive. This month is taken as a dry month, as prior to that time the numerous side streams swell the amount delivered at the gauge.

RECORD FOR AUGUST.

YEAR.	Water turned at Milton, 24 hours, inches.	Water record at Bloody Run, 24 hours, in.	Per cent.
1875	44,000	34,950	79.4
1876	59,700	42,625	71.3
1877	67,875	44,700	65.9
1878	76,650	58,875	77.4
1879	82,725	51,350	62.0
1880	74,080	55,325	74.7
1881	66,850	48,325	72.3
1882	68,300	50,984	74.4

The Eureka Lake ditch, with 2,500 inches turned in at the head, delivers at the gauge, thirty-three miles distant, about 1800 inches in the dry season.

The above statistics lead to the adoption of values of the co-efficient c, varying from 31 to 45, in estimating the capacity of ditches on heavy grades of forty miles length flowing from sixty to eighty cubic feet per second, such as referred to that is:

$$Q = 31 \text{ to } 45\ a\sqrt{rs}.$$

The loss incurred in the distribution of water is denoted by the following figures taken from the official records of two mining companies. The amount received is measured, at or near the distributing reservoirs; the amount used, at or near the pressure boxes. The difference shows the losses from leakage, evaporation, absorption and wastage arising from excess of constant supply over the amount needed, with interruptions at the claim.

NORTH BLOOMFIELD COMPANY (24-HOUR INCHES).

Year.	Am't Rec'd.	Am't Used.	Loss.
1870 to 1879, inc...	5,838,865	5,504,758	334,107=6
1880	945,550	920,612	24,938 2½
1881 (*i*)	950,340	866,962	83,378=9
1882	1,025,880	1,005,977	19,903=2
1883	862,660	836,251	26,409=3
14 years	9,623,295	9,134,560	488,735=5

2 years	1,132,157	997,761	134,396=13

(*i*) Much water run to waste during 4 months, owing to cessation of work caused by litigation. (*j*) English reservoir was destroyed June 18, 1883, from which source the main water supply was obtained.

Bonanza.

Flourishing Idaho District.

A correspondent of the Ketchum *Keystone*, writing from Bonanza Custer Co., Idaho, says: Last year was one of prosperity here, considering the number of people in the district, and this will be fully as good, or better.

The Custer Co.'s Mill

Crushed all the custom ores brought to it consequently there were none shipped to the outside, as heretofore. The mill has thirty stamps, with a capacity of thirty-five tons, and has been running regularly all winter on Unknown and Summit ores, with a yield of $40,000 to $50,000 per month. There is said to be ore sufficient in sight to keep the mill employed till the first of January next, and by that time, in all probability, other ore bodies will be opened on the company's ground or other ledges be purchased with which to keep up the supply of quartz. The Gen. Custer Co. has been very successful in its operations here, and the yield of the mill has been large—not much less, on an average, than one million per year. The bullion contains about one-third gold in value, and has not varied much from this from the start.

The Charles Dickens Mine

Is about the same as ever. The ore in sight is wonderful, not only as regards quantity, but quality. The stopes and levels show well, and the deeper working prove the permanency of the mine. A winze sank 60 feet below the floor of the lower tunnel, with levels run east and west, give a showing of four to six feet of ore, with a high average. Much of the ore sent from the Dickens mine to the Custer mill last season averaged over $400 per ton. The higher grade of ore is stored in the mine, and the lower grade is on the dump and in the ore houses, of which there are 5,000 or 8,000 tons. There are twelve to fifteen men employed in the mine, and huge quantities of ore have been extracted during the past winter. The wages at the mine are yet $4 per day and board, as they always have been. There are three veins on the Dickens location, and each of them rich. The mine is now opened to a depth considerably over 300 feet. Last season the

Montana Mine

On Mt. Estes, had over 400 tons of ore worked in the Custer Co.'s mill, the gross yield of which was $98,000. Twelve to fourteen men have been employed in the mine during the winter. This mine is also over 300 feet deep, and good ore in the bottom.

Another ore producer came to the front last season, namely, the Whale mine. For years this has been believed to be a valuable piece of mining ground, but its true merits were unknown until within a year past. Two rich veins were found on the surface last spring and work commenced at once. Between 35 and 40 tons of ore sent to the Custer mill sampled on an average a little over $400 per ton. The veins are from one to two feet in width, and the ore is spotted with horn silver, and in places shows free gold. It is owned by Jas. Hooper, of the Montana mine, and the Galatian Brothers.

On the Dickens Hill, outside of the Dickens mine, there has been much work going on all winter. The Juliette tunnel (on an east extension of the Charles Dickens vein) is in over 400 feet. Mr. Wm. Toole has the management of this mine, and the work is acknowledged to be a pattern of excellence. Near the Juliette John Carroll is running a tunnel to strike the Daniel O'Connell vein 400 feet from the top of the ledge.

West of Dickens Hill John G. Morrison has kept men at work all winter and spring on Paradise and Wathington ledges. He is now running a hydraulic on the gravel bar on Washington Hill, and getting good pay, with it some very large nuggets.

Aside from the Custer Co's mine, on Custer mountain, there are a large number of promising prospects. Among them the Continental, Lucky Boy, Annie, Gen. Miles, Black, Vishnu, and others too numerous too mention, in most of which are veins of good ore; but at present there is but little work bing done outside of the annual assessments. The camp employs about 250 men.

Outside Camps

Are springing up all around us. Sheep Mountain, forty miles to the west, sent several tons of silver-lead ores to the Bayhorse smelter last fall, and it paid well even at that distance.

Clayton, on the Salmon river, thirty miles from this place, is taking on quite a boom this year. Dave Woods, of the Excelsior mine, Crooks, formerly of the Bayhorse smelter, and others, have bought the Kinnikinic smelter, and are getting ready to start it up on Excelsior and other ores.

The Bayhorse smelting works are running on Ramshorn and Squaw creek ores. There is also considerable good ore out on the head of East Fork that will go to the smelters of the Salmon river.

Nearly all the Stanley Basin country was bought up last season by a Wood River and Nebraska company, and it is the intention to bring in a large ditch from Basin and tributary creeks, with which to work the extensive placers. This will make a lively and permanent camp of Stanley.

There is a new quartz camp struck between Stanley and Cape Horn, and the ores so far assay well. There are places there also that will be worked this season.

On Loon creek there will be more done this season than for years past, both in placers and quartz. Several companies are at work there now.

The Yellow Jacket and Moose Creek gold quartz mines, 50 miles north of Yankee Fork, are paying first rate, and will doubtless make good little camps. Big Lost River is also a promising quartz camp, in this county, and will have a large population before fall.

I think all the Salmon River country is gradually on the improve. The mines are numerous and generally bear development. What we need badly is a wagon road connecting this part of the country with Wood River. There is already a good road to Stanley Basin from your side, and from Stanley to this place is only eighteen miles, and not a very bad country to build a road over. The cost would not be over $15,000.

As a good evidence of the stability of our mining districts, we have but to note the settlement of the farming and grazing lands near them.

THE industrial classes of Germany are in a languishing state and much suffering exists in all the manufacturing districts. The general movement of the working people is in the direction of a small increase of wages, and more especially of a reduction of the hours of labor from twelve to eleven hours a day. The movement is daily widening and strengthening, and a significant fact is that it has the warm support of a large majority of the daily papers of that country.

(*d*) See professional papers, Corps of Engineers, U. S. A., No. 12, page 26. (*e*) Humphreys and Abbot, Mississippi Report, page 207.

(*f*) Increase capacity of this ditch is limited by the pipes across Humbug canyon. (*g*) For details of Texas Creek ditch and flume, see paper by Hamilton Smith, Jr., Transactions Am. Soc. C. E., Vol. XIII, pp. 30-31. (*h*) The grades given in all the above cases, from which the different values of C were calculated, exclude the drops, chutes, flumes, etc.; sectional areas represent minimum cross-sections.

Mining Machine Experiments.

Several very important mining machine experiments have this week been made, in presence of a number of colliery proprietors, Mr. Robson, assistant inspector of mines, and others at Alloa Colliery. Mr. D. Whitcomb, Chicago, arrived in Scotland a month ago, with the view of bringing the "Harrison" improved mining machine before the notice of colliery proprietors He obtained a permission from Mr. Roxburgh, of the Alloa Coal Company to test the machine, and accordingly, he had three introduced into the Wimyhall Pit. Two were taken to the longwall working, and one to the stoop and room, so that a thorough test might be made in moderately soft and hard coals. The machine is adapted for "holing" and cutting, or technically, "shearing" coal, and is worked by compressed air. It weighs 660 lb., and is therefore easily removed from one place to another. The machine, when in operation, requires two men in attendance, and strikes from 190 to 210 blows per minute. The operation is exactly similar to that of a vertical bore. The experiments were considered most satisfactory, and in the longwall the machine repeatedly drove a piece of "holing" six yards in extent in a distance of three feet in twenty minutes, the men in attendance showing less signs of exhaustion than those engaged with the picks. In the stoop-and-room, where the coal is exceedingly hard, the work performed has been remarkable. In a tough fireclay "holing" the machine pierced over and over again a hole 5 ft. square in twenty six minutes, while the "shearing" was cut in a distance of 4 ft. in a coal fully as many feet in thickness in twenty three minutes. Mr. Whitcomb claims that two men and one of his machines can perform as much labor as eight skilled miners. As to the expense, it appears from the experiments in mines, where six machines might be introduced, the wages of three men to each machine would meet all the outlay incurred in every connection, that is to say, that 1s. 6d. per day would meet the expense of the driving power, &c., of each machine. One important feature is the fact that the continual freeing of the wasted air improves considerably the ventilation of the workings. Mr. Roxburgh has signified his intention of introducing the "Harrison" in every seam practicable, and it is expected that other Fife and Clackmannan coalmasters will follow suit.—*Collier Guardian.*

The foreign trade of San Francisco has declined seriously this year, compared with last. The total imports during the last three months are valued at $8,500,000, which is a decrease of nearly $2,500,000, compared with the corresponding months in 1883, and is particularly noticeable in the importations from China and Japan. The countries showing an increase are the Central American States, Tahiti, British Columbia, British East Indies, Australia and New Zealand, the Hawiian Islands, Mexico, Dutch East Indies and Manila all Pacific Coast countries! It should be borne in mind, however, in this connection, that a decrease in foreign imports is not always an evidence of decreased prosperity. It is quite often an evidence of an increase in home production that we are simply multiplying our fields of labor at home.

Idle Coal Miners.—A dispatch from Columbus Ohio, dated the 23d says: "The remainder of the miners in Hocking Valley came out to-day against the reduction of ten cents. Thirty-two mines are now closed including all those of the Ohio Coal Exchange, the Columbus and Hocking Coal and Iron Company, the Upson Coal Company, the Shawnee Valley Coal and Iron Company, the X X mines, Gorslin & Barber's and G. A. Blood's mine. About 5,000 men are thus thrown out of employment, besides those living along the railroad tributary to the coal region. The mines above enumerated embrace all the Hocking Valley and Shawnee fields.

Fire Damp Indicated by the Barometer.—It is well known that the escape of fire-damp in mines is intimately associated with the hight of the barometer, which thus becomes a means of foretelling when such escapes are most likely to occur. But according to M. de Chancourtois, who has brought the matter before the French Academy, the danger is also increased by strain in the earth's ernst causing or opening fissures in the coal; and he therefore proposes to fix sismographic apparatus at the head of every dangerous mine in order to detect these strains and provide additional precautions against the gas.

The Chinese Placer Miners.—The Virginia *Enterprise* says that several gangs of Chinese are engaged in mining on Gold Canyon, between Silver City and Dayton. One company which is at work just above Dayton, is working to the depth of about fifteen feet. The company is in ground never before worked. Bedrock has not yet been reached, yet the gravel pays wages that satisfy the Mongolians.

Severe Tarantula Bite.—J. D. Bentley, a wealthy farmer of Modesto, was bitten by a tarantula the other day, and in about ten minutes afterwards the bite resulted in delirium, and almost in death.

Useful Information.

Storing Furs in Summer.

"When we put furs into storage for the season," said a man recently, "our first care is to beat them thuroughly with rattans to drive the dust out, and get rid of the moth eggs that may have been laid in them or been blown into them from the air This done, they are hung on wire frames that distend them, and put into closets that are lined with tar paper. Moths cannot stand the strong odor of tar, and never live long under its influence. Every three or four weeks the furs are taken from the closets and beaten with rattans; and so, in the course of a season, every article has to be handled at least a dozen times. In old times camphur was used; but it has been discovered that it had a tendency to detract from their color, and make them much lighter in line. I suppose there is something in the dyes used for sable and other dark furs that camphor influences. Old women still use that drug, however, and when you see a sealskin sack or cloak or dolman that shows streaks of gray or a muddy yellow, you can be sure that it has been kept in camphor through the hot weather. The whole secret of keeping furs is to beat all the dust out of them and then keep them in a close closet impregnated with the odor of tar. Another old preventive was pepper, either Cayenne or common black, but this has been abandoned; and some good housekeepers used to keep their furs in tobacco cuttings. I have seen moths flourish in tobacco; and, where I have seen insect powders used, they have sometimes injured the furs in some way, or have been totally useless in guarding them from their bitter foe.

"Another desideratum in storing furs is strict cleanliness. We wash all the closets every Spring with water and common washing soda, and the latter serves to destroy any moth eggs that may have got into the place. Thus our closets are never invaded by the moths, but should we show carelessness for a single week the result would be disastrous. Muffs, collars, and other small articles we keep in boxes, packing with them sufficient tar paper to keep out the moth; and the shelves on which they stand are always kept free from dust."—*Popular Science News.*

How to Cool a Room.

The composing room of the New Orleans *Picayune* is situated in the upper story of its publication house, just under the roof, and in summer is extremely hot. An inspiration seemed to have come to one of the oppressed occupants, and in accordance with it a vertical wooden box was constructed in the corner of the room, with openings at the floor and ceiling, and furnished with a pipe for supplying water at the top, and a pan and drain at the bottom for receiving the flow and carrying it safely away. The supply pipe was bent over the upper end of the shaft, and fitted with a rose like that of a watering pot, so as to deliver a shower of spray instead of a solid stream. On connecting it with the service pipe, the movement of the water was found to cause an active circulation of the air in that part of the room, which was drawn in at the upper opening of the shaft and issued again, cool and fresh, at the floor level. The most surprising thing about the experiment seems to have been the effect of the water in cooling the air to a degree much below its own temperature. With Mississippi water, which, when drawn from the service pipe, indicated a temperature of eighty-four degrees, the air of the room, in which the thermometer at the beginning of the trial stood at ninety-six, was cooled in passing through the length of the shaft to seventy-four degrees, or about twenty degrees below the temperature at which it entered, and ten degrees below that of the water which was used to cool it. Of course the absorption of heat hy the evaporation of a portion of the water, accounts for its refrigerating effect, but the result seems to have been so easily and inexpensively attained, that the experiment would be well worth repeating in other cases.

Frosty Windows and Glycerine.—A very thin coat of glycerine applied on both sides of window glass will prevent any moisture forming thereon, and will stay until it collects so much dust that you cannot see through it; for this reason it should be put on very thin. If used on a looking glass you can shave yourself in an ice house, and the glass will not show your breath. Doctors and dentists use it on small glasses with which they examine the teeth and throat. Surveyors use it on their instruments in foggy weather, and there is no film to obstruct the sight. Locomotive engineers have used it as a preventive of the formation of frost on their cab windows. In fact it can be used anywhere to prevent moisture from forming on anything. It does not injure the usefulness of field glasses, etc. In fact, a small drop of pure glycerine in a small hole in a sheet of brass makes a good lense for a small microscope.

Woodchuck Oil for Leather.—From previous reports, and especially from our own recent observations and experiments, we have come to set a high value upon the oil of the common woodchuck or "ground-hog" for leather. This oil, while having considerable body, seems to have some of the non-drying quality of glycerine, but, unlike it, is not removed by water. An old still harness saturated with this oil early in July last, after going through the hot weather, still remains soft and pliable. The lines were even too greasy to handle well until after a month's drying. An old pair of heavy boots, so stiff as to hurt the feet unbearably, received a good coating of this oil August 1st, on the bottoms and two inches high all around the sides, and they soon became almost as soft and easy to the feet as moccasins. By the way, oiling the soles of boots and shoes renders them more elastic, easier to the feet, and less liable to break and crack and wear out on rough ground and stones, and therefore more durable; and at the same time the oil excludes water and dampness. It is highly esteemed by some hunters for guns. A carpenter commends it for tools. If dealers in harness would keep the oil on sale it will bring a good price whenever its qualities become known, while the opening of a market for the oil would stimulate and hasten the destruction of the pests. We have taken fully two quarts of oil from a full grown, fat, fourteen-pound "chuck."—*Am. Agriculturist.*

New Paint.—At the military port of Brest, a mixture of zinc white with zinc chloride has been used for some time, with good result, in painting wood and metals. It becomes very hard, and can be washed or brushed without injury. It should not be applied, however, in rainy or frosty weather, as it then becomes mealy and scales off easily. Chloride of zinc is not the only salt which possesses the property of forming a mastic by its mixture with zinc white. Sorel long ago indicated the protochlorides of iron, manganese, nickel and cobalt as good bases for mastic. After having verified his views, the authorities of Brest have extended his experiments, and have shown that the sulphate and nitrate of zinc, the sulphate, nitrate and chloride of iron, and the sulphate and nitrate of manganese form good mastics and paints with zinc white.

Luminous Paper.—A foreign contemporary says that a luminous waterproof paper, which may be of use in places not well adapted for the application of the so-called luminous paint, may be made from a mixture of 40 parts pulp, 10 parts phosphorescent powder, 1 part of gelatine, 1 part of potassium bichromate and 10 parts of water.

Brightening Carpets.—Very many devices are in use for brightening carpets at sweeping time. Some people use wet newspapers, torn up into little bits; others use tea grounds. A mixture of Indian meal and salt, sprinkled upon a carpet and brushed off with a stiff broom, is also good.

Good Health.

Sunstroke.

In response to a request from one of our correspondents that we would print some directions for treating sunstroke, we copy the following circular, issued by the New York Board of Health. Sunstroke is caused by excessive heat, and especially if the weather is "muggy." It is more apt to occur on the second, third or fourth day of a heated term than on the first. Loss of sleep, worry, excitement, close sleeping-rooms, debility, abuse of stimulants, predispose to it. It is more apt to attack those working in the sun, and especially between the hours of 11 o'clock in the morning and 4 o'clock in the afternoon. On hot days wear thin clothing. Have as cool sleeping-rooms as possible. Avoid loss of sleep and all unnecessary fatigue. If working indoors, and where there is artificial heat (laundries, etc.), see that the room is well ventilated.

If working in the sun wear a light hat (not black, as it absorbs the heat), straw, etc., and put inside of it, on the head, a wet cloth or a large green leaf; frequently lift the hat from the head and see that the cloth is wet. Do not check perspiration, but drink what water you need to keep it up, as perspiration prevents the body from being over heated. Have, whenever possible, in additional shade, as a thin umbrella when walking, a canvas or board cover when working in the sun. When much fatigued do not go to work, but be excused from work, especially after 11 o'clock in the morning on very hot days, if the work is in the sun. If a feeling of fatigue, dizziness, headache or exhaustion occurs cease work immediately, lie down in a shady and cool place, apply cold cloths to and pour cold water over head and neck. If anyone is overcome by the heat send immediately for the nearest good physician. While waiting for the physician give the person cool drinks of water or cold black tea or cold coffee if able to swallow. If the skin is hot and dry sponge with or pour cold water over the body and limbs, and apply to the head pounded ice wrapped in a towel or other cloth. If there is not ice at hand keep a cold cloth on the head and pour cold water on it as well as on the body. If the person is pale, very faint, and pulse feeble, let him inhale ammonia for a few seconds, or give him a teaspoonful of aromatic spirits of ammonia in two tablespoonfuls of water with a little sugar.

Diluted Milk.—We presume there are differences in the quality of the milk but it would be valuable information to know how much of it is absolutely pure. Few of the complaints are heard in San Francisco that are made against the milkmen of New York, where they have been frequently arrested, and, in a number of instances heavily fined, during the last two or three years, for feeding their cows on sour slops until they have become objects of repulsive disease. But that our milk is diluted needs no expert to decide. It is only necessary to drink a cup of the lacteal fluid to discover that it is misnamed, and should be called whitened water. There is probably no article vended in the market that to a greater extent undergoes the adulterating process. If the water is not mixed with poisonous ingredients, the few gills of milk it contains to the gallon can be drank harmlessly, but with no hope of furnishing any nutrition. Here are the proportions of a fluid termed milk which was submitted to analysis in New York: of water, 88.32 per cent; of fat, 3.06 per cent; of other substances, 8.62 per cent. This analysis was produced in court against a milk vender named Meyer, who was fined $500 for selling the abominable stuff. It was further shown that this so-called milk was liable to produce scrofula, diphtheria and blood poisoning. We have no idea that the deception practised on milk consumers in this city is so great—that is, that it contains foreign poisonous matter as in New York - but this could be better told if we had a competent and honest milk analyzer, for which there is a demand that will be backed by hundreds of families, who know they are paying for a quality of milk which they do not get. Possibly the Board of health has a duty to perform in the premises. *Call.*

Sea Bathing.

Sea-bathing is not a cure-all, yet there are few classes of people to whom it may not bring some benefit. For delicate constitutions and for many of the complaints of debility sea-bathing is a powerful tonic. It is medicinal for many invalids. Of the many persons who are in need of a tonic and strengthening treatment there are few who will not derive some benefit from sea-bathing, provided only that they will make haste slowly and bear in mind the necessary precautions.

The question of the sea temperature is an important one for a safe beginning. The water must be warm enough. A chief source of benefit in sea or river-bathing is indeed, the coolness of the temperature and the consequent healthy glow of warmth caused by the rushing of blood to the skin on leaving the water and the stimulating influence upon the viscera. But all this is too active treatment for the invalid at the beginning. One must be educated up to the tolerance of the cold bath.

At some of the French seaside resorts, and recently at some of our own, as at Marblehead, the excellent plan is followed of giving preparatory baths of warm sea water indoors. It is a good beginning for some very delicate women, who find even the summer heat of the Mediterranean (75 to 80° Fahrenheit) too cool at the outset But whenever this initiation is practiced, it should not be a long one. The artificial warmth of the bath should be lessened day by day until after a moderate time it is reduced nearly to that of the sea, and the patient is proven strong enough to cultivate a more intimate and invigorating acquaintance with old ocean himself.

For this purpose a calm, warm and sunny day should be chosen; a windy day should be particularly avoided, for the evaporation from the clothes and the body is then so rapid as to chill the body both on entering and leaving the water. Never go into a cold bath when you feel cold. This well applies to all bathers, whether strong or delicate. To make it effective, it is desirable to lose no time, after beginning to undress, in getting into the water. The best time of the day is two or three hours after eating, and preferably in the forenoon. It may be borne in mind that the beach and the waves themselves are generally cleaner during the ebb tide than during the flood, and it is desirable that the air should be warm as well as the sea. The sun being well out, the first bath from the beach may be taken, and it should be a very brief one, lasting no longer than is necessary to wet the body from head to foot. On leaving the water the bather should strip and be rubbed dry, and this immediately. Indolent bathers run more risk by lingering and shivering in their wet clothes than from any amount of swimming.

Decay of the Bones. This is a terrible disease; the shrinking and ultimate decay of the bones of the human system. It is usually, if not always, a result of insufficient or improper nourishment during childhood. It is a disease which, when it has once attacked the system, cannot be eradicated by any diet or medicine that may subsequently be taken. Unfamiliar as this disease is it is so common in London and some other portions of England, that the frequent cases exposed at the clinics attract no special attention. It is almost unknown in this country.

Brain Wear.—So far from being injured by severe labor, carried on under normal conditions, the brain is improved by it. Mental activity, like muscular exercise, keeps the brain in a healthy state. When, therefore, a man says he is suffering from the effects of mental overwork, I want to know what his views are. Worry may be one of these; worry is exhausting. The worries of life do infinitely more harm than the work of life, howsoever onerous it may be.—*Dr. R. Bartholow.*

MINING SUMMARY.

The following is mostly condensed from journals published in the interior, in proximity to the mines mentioned.

CALIFORNIA.

Butte.

BIG BEND.—Butte *Record*, June 28: Work on this tunnel has now been in progress some 19 months. The total distance to be made is 12,007 ft. The tunnel is now in, or will be at the end of the present month a distance of one mile, or 5,280 ft. It will thus be seen that the company have yet much work to accomplish before reaching the river where they propose to erect their dam for the purpose of turning the river into the flume. We understand they are now at work in soft rock, and expect to make good progress for sometime.

El Dorado.

INEZ.—*Mountain Democrat*, June 26: A New York company has taken hold of the Inez mine at Nashville, with T. F. Kay as Supt., and work will be vigorously prosecuted and the mine thoroughly devloped. This mine has been worked to a depth of 200 ft, and promises well. The company now is erecting some of the finest hoisting machinery ever brought to the country.

GRAND VICTORY MINE.—Cor. *Mountain Democrat*, June 26: It has been rumored for several years by local experts, that we have no mine here. The Grand Victory mine has produced in bullion nearly a quarter of million dollars from the croppings of the ledge, no greater depth than fifty ft being attained to produce the above large amount of bullion. In the fall of 1880, a superb and highly-finished 50-stamp mill was built on the mine, supplied with every known modern appliance for the saving of labor. This mill now is in better condition than it was three years ago. It has been proved beyond all argument that the ore body is continuous. It is likely the Grand Victory ore body stands without a parallel in the history of mining in this county, for never was so large a body of gold-bearing ore discovered. And for information of croakers, I will say my lease of the mine does not expire till late in the present fall, and it appears at present there is very little danger of the property laying idle. Fifty stamps are now at work and will continue to do so as long as the water supply may last, and the elements permit. The mine was bonded to the writer July 11, 1881, and subsequently leased to the same party. When the property passed over to the present management, a new system was adopted. All men employed, and merchants supplying the mine, were informed that the 10th of each month would be established as pay day. Each man has been paid for every lick he struck, and every merchant who presented his account on each pay day has met the same result, whether bullion has been produced or otherwise, and we still intend to continue to do likewise.

Inyo.

SLATE RANGE.—Inyo *Independent*, June 28: Dr. A. P. Whittell returned to the State Range yesterday and will soon start up the mill on ore already on the dump, of which there is considerable.

CHANGE OF MANAGEMENT.—We are informed that A. P. Minear has taken charge of the Elna furnace and will start up shortly on Pine Mountain ore.

Mono.

BODIE CON.—*Free Press*, June 30: During the past week 500 tons of ore was worked at the mills. The average assay value of the pulp was $12.85, and that of the tailings $1.85. The Bodie mill finished crushing ore on Friday morning. They will commence working tailings on Monday. The south drift on the 550-foot level of the Fortunia is in 40 ft. Upraise on the Gildea, 432-foot level, is up 20 ft. North drift from upraise No. 4, 300-foot level, is in 95 ft. South drift from same is in 15 ft. The rich ore above the 306-foot level has pinched out. No change to note in any other place in the mine.

STANDARD CON.—They extracted and shipped to the mill 594 tons of ore. Received 1,750 tons of crude bullion on the two weeks' run, and shipped to the company to-day $13,975.88. South drift No. 1 from south winze No. 2, 385-foot level, is in 116 ft; progress, 11 ft, showing the vein 11 ft wide. The north drift No. 3, from the main west crosscut, has been extended 12 ft; total length 206 ft. The vein here is 3 ft wide. South drift No. 4, from east crosscut No. 2, is in 167 ft; progress 11 ft, with the vein 2 ft. Upraise from south drift No. 1, 500-foot level has gained 10 ft; total length 115 ft; the vein is about 2 ft wide.

BULWER CON.—The south drift from west crosscut No. 2, 500-foot level, has been extended during the week 11 ft, and is in 307 ft. The vein is about 1½ ft wide.

BODIE TUNNEL.—Advance in the north drift on the 200-foot level 15 ft; total 135 ft from the west crosscut.

Nevada.

QUARTZ AND GRAVEL.—*Transcript*, June 28: The Yosemite mine, near Banner Hill, which is now being worked by Tiernan & Co., promises to be a good mine. They have taken out one crushing which yielded about $40 per ton. Some time ago they commenced running a tunnel to tap the ledge and expect to make the connection this week when the development of the mine will be pushed ahead. The Nevada drift mine, at You Bet, is now employing twice as many men as were required when the mine was worked by the hydraulic process. The quartz mines in and around Nevada City, were never in a more prosperous condition than at the present time. Never in the history of the town were there so many quartz mines in full operation and twice as as many claims are being prospected now as were ever before at one time. The outlook for this district is exceedingly brilliant, all croakers to the contrary notwithstanding. The prospects in the mine at Willow Valley, which is now owned by Geo. E. Turner, Ed. Tilly and Capt. Hieatt, are very fine. A large number of assays, of the rock, taken from different portions of the ledge, indicate it to be big property. The lowest assay was $13 and the highest about $140. Work is to be renewed on the Black Prince mine, Deer creek, some time this summer. it is situated on the east side of the Providence mine, and has not been worked for a number of years. The North Banner Quartz Mining Company, will, in a short time, give employment to a great many more men than they now do. The Hussey mine in Willow valley district, continues to look well. They are about letting some contracts for the running of drifts. Before long this mine will be in a condition to rank among the best hereabouts. The Locklin mill is kept running a great deal of the time on custom rock which is being taken out of newly discovered ledges in that locality. The Neversweat mine on Deer creek is in a very promising condition. The owners feel highly elated over the results thus far obtained from their property. More interest is now being taken by our merchants in quartz mining than ever before. The reports from the Derbec drift mine are of the most flattering character. A short time ago some of the stock was sold in San Francisco for 50 cents per share. Now it is held at double that price and very little is offered for sale at any price. The news in relation to Washington quartz mining district continues to be of the most favorable character, and we know of no reason why it should not be better and better as each additional day's prospecting is done. A better chance for making a good strike does not exist anywhere. If the mountains of quartz that are there had been located in the Coeur d'Alenes, with the thousands of live gold-hunters that recently congregated in the latter country large and permanent towns would have been built up; but Washington district being in Nevada county is too easy of access to be appreciated. It is generally believed that the North Bloomfield and Milton hydraulic mining companies will make an attempt to drift their ground. We hope they will as it would give employment to an army of men and an era of prosperity would dawn upon the now poverty-stricken people on the Ridge, who were made poor by the unrighteous decree of a man by the name of Sawyer. In the mean time every company which has not aided in the defense of the crusade against the miners should come forward, coin in hand, to assist in having Sawyer's decision reversed. The fight should never be given up until every hydraulic mine is put in successful operation again.

SPENCEVILLE COPPER.—Nevada *Transcript*, June 30: That the mill on the copper mine is about to be removed. Cause: The best of the ore has been ascertained to be right under the mill, and as the vein extends to the surface the mill has to be moved or the vein left unworked. The mill will be put up in a more substantial manner, as the owners of the mine are confident that they have a good thing, and they are going to stay by it. The hoisting works will not be removed. There are now 18 white men and 25 or 30 Chinamen employed at the mine, and when the mill is moved more men will be put on. The ore is improving as depth is attained, and, all in all, everything looks well for the prosperous future of the Spenceville copper mine.

Plumas.

LUCKY S.—Greenville *Bulletin*, June 21: Satisfactory arrangements have been made with Messrs. E. D. Hosselkus, John Hardgrave and J. W. Thompson, to furnish the needed funds to erect a mill on the property, and to place the mine in complete running order. Voluntary aid from the stockholders, therefore, will be unnecessary, and no assessments will he made. The gentlemen named above are among the "solid" men of the county, men of business capacity, and will prosecute with vigor whatever they undertake. Everything at the mine is looking favorable, and the work is progressing satisfactorily, considering the annoyance of the late rains. The Gold Stripe mill has stopped for the present. The rock that was crushed came from a break from the main ore chute. The mine is not sufficiently developed to keep the mill running. The Supt. informs us that from less than 170 tons crushed, $1,000 was obtained. It is a pity that the owners in New York do not put up sufficient money to properly develop the mine. The Providence mine owned by Adams & McPherson is looking quite well. We are informed that the reports from three assays made in San Francisco, shows an average of $19 per ton.

ELIZABETHTOWN.—Plumas *National*, June 28: The Loring & Leavitt shaft is down 104 ft, and a drift is being run to the east to tap the channel. The water is not troublesome as yet. The works are being inclosed and covered in good shape, and the owners expect in a short time to be taking out good pay. Everything goes like clock-work, and so far no back-sets have been encountered.

San Bernardino.

PROVIDENCE, EXCHEQUER, ETC.—Calico *Print*, June 28: From Mr. Sy. Quinn, we obtain the following reliable information as to what is doing in the mining circles in eastern portions of this county:

PROVIDENCE.—In the famous Bonanza King, a large and exceedingly rich body of ore has lately been found upon the 400-foot level, keeping the mill constantly running, turning out the usual quantity of silver oullion, working from 80 to 100 men. The northern extension of the Bonanza King, owned by P. R. Kerr, has a shaft down 50 ft, with a drift running northerly 40 ft and a winze at the end of drift 35 ft in depth showing high grade from the surface to the extreme depth, about 80 tons of ore on the dump. J. B. Cook's claim is now showing up well. Gorman and Dwyre are owners of a mine of great promise, having a short time since struck a good body of very high grade ore. The outlook of the camp in general is flattering, giving promise that Providence will, in the near future, come to the front as a bullion producer, and add one more star to the banner of old San Bernardino.

Sierra.

A GOOD FIELD FOR INVESTMENT.—Sierra *Tribune*, June 27: It is safe to say that capital and enterprise are all that is necessary to develop the fortunes now lying idle in the quartz lodes in Sierra county. Sierra has always stood high among the rich mining districts of the State, and it has been pretty clearly demonstrated that an investment of capital in the mines of this county is no wildcat speculation. It is slowly dawning upon people that the old mining counties of California are a mighty long ways from being "petered out" yet. And they are entirely correct in coming to that conclusion. We who live here know that the mineral resources of Sierra county have scarcely begun to be developed yet. The mining industry is yet in its infancy.

THE BLACK JACK MINE.—C. W. Cross was up from Nevada City Monday on business connected with the Black Jack quartz mine, located in Jim Crow canyon. J. B. Johnson of New York City is now the sole owner of this property. Mr. Cross is going to New York immediately to conclude arrangements preparatory to starting up the mine. He expects to begin operations there this summer, and funds have already been raised for that purpose. The mine will be under the control of Mr. Cross, who will place in charge an experienced miner.

THE FOUR HILLS MINE.—Geo. Reynolds, Jr., was down from the Four Hills mine last Wednesday and reports everything in good condition. The mill was started up little over a month ago, and is running on first-class ore. Twenty-five men are employed at the mine, and work is being pushed rapidly ahead. The snow in the vicinity of the Hills is about three ft deep.

ALLEGHANY.—We are informed that this place is rather quiet at present. The Rainbow Company are pushing ahead their new tunnel as rapidly as possible. When the vein is reached the mill will start up again and a large number of men given employment. There is no doubt of a successful result to the prospecting operations now going on in that district, and eventually this will restore life to the now comparatively dull town of Alleghany.

MINING INTERESTS.—*Mountain Messenger*, June 28: A large number of idle men are here, unnecessarily attracted by an over-flattering account of demand for labor. Miners abroad better heed this timely warning, and seek elsewhere for work. Blue Gravel Co. are sinking through gravel to bedrock, looking for pay. Five men are employed. Colombo Co. are making a road from their quartz mine back on the ridge to obtain timber and wood. This will do away with the chute, now being used. The 20-stamp mill is steadily running. Supt. W. H. Rodda, formerly of Grass Valley, has charge of the property. Rising Sun Drift Co., near Thompson's ranch, below Sierra City, have their main tunnel through the rim rock, and chances are very favorable for finding rich gravel. Last fall, a half-ounce gold specimen was discovered in the underground workings, besides smaller pieces. Phillip and Samuel Uren and Wm. Eldridge are the owners. Kentucky Quartz M. Co. are bringing in a large flume, four ft wide and three ft high, very near one-half a mile of which has been graded, mostly through hard blasting rock, to work the ledge. This mine is located back of the residence of Thos. Devine, and claimed as an extension of the Sierra Buttes, running east and west. Ike Martinetti and Jas. Kane own the property. Young America quartz ledge, between Sardine and Packer lakes, is now connected by trail with the Sardine house. Sinking of a shaft 5x6 has been commenced. Ore in sight is very rich, milling over $50 a ton. There are four locations each of fifteen hundred ft. Ledge is traceable all the way. A cabin, to accommodate 8 or 10 men, will soon be built, and a 10-stamp mill put up by fall, if everything prospers. Owing to the late storms, work has progressed slowly. Five men are employed.

Siskiyou.

PICK AND PAN.—Yreka *Union*, June 26: The Cedar Tree quartz mine on Deadwood will yet come to the front as one of the best leads in the county, under the energetic management of Messrs. Tucker, Knight and Behnke. Their arastra has been idle for several days, but will soon start. They can crush 2¼ tons a day easily enough, insuring good pay with the rock now being taken out. The Humming Bird quartz mine, on Deadwood, is looking up, and the force of workmen will be increased soon. The claim has excellent water privileges, sufficient to run a mill should they decide to erect one. At present the crushing is being done by an arastra, and a new one will be commenced before long. A new tunnel will also be commenced in a few days. Richer strikes are expected in the Deadwood county than in any other portion of the county, which is due to the fact that nearly all the ledges pay the expense of thorough prospecting. The Eliza, on Deadwood, is being worked, and the owners have the greatest assurance that their labor will be rewarded in time. All the claims on McAdams creek are paying well. The Mitchell claim at Callahan is being energetically worked this season, and will pay well, as it has in the past. The hoisting and puniping machinery in the mine is not excelled by any in the county. The McConnell claim, on the Klamath, is being worked with telling effect. One hundred dollars is taken out daily. The stockholders of the Empire lode, situated in the Honolulu district, are jubilant over the flattering developments now being made. We are at present enjoying a mining boom, and as the majority of our claims are operated by home capital the county receives the full benefit. We have the mines, and we have the capital to work them as they should be.

NEVADA.

Washoe District.

OPHIR.—*Enterprise*, June 28: Are sorting out fillings in the various drifts on the 250 level. Are preparing to start a drift from the 500 level of the main shaft, which will drain all the ground in the old works from the bottom of the old Mexican shaft upward and permit of a thorough exploration of the ground.

HALE AND NORCROSS.—Good returns have been obtained from the ore worked at the Mexican mill on the Carson river, and ore is now being shipped to the Eureka mill. To the latter some 600 tons have already been shipped. This ore is from the 200 level

MEXICAN.—They have now but fairly begun sinking the winze toward the 3300 level. About the only change seen is that there is rather more quartz in the bottom than was seen above.

SIERRA NEVADA.—The work of putting in column at the hydraulic pump in the joint Union Con. winze is completed. The diamond drill, which has been put into the north drift on the 3100 level, is showing quite a strong flow of water. However, this water may come from a small streak that will soon drain out,

ALTA.—Good headway is making in the east drift on the 2150 level. The ground thus far is perfectly dry. The diamond drill is again being run to the west, the miners having pushed the drift forward to the end of the old drill-hole. The drill is now out nearly 100 ft.

CHOLLAR.—Good progress is making in the construction of the stone bulkhead on the 2600 level. Now that the pump is in at the 2900 level of the Combination shaft they will soon be able to resume prospecting in this mine and the Potosi.

IMPERIAL.—The lateral drift from the main west drift is in the Alpha ground. It shows much quartz of a favorable appearance, and the indications are good for finding ore that will pay milling.

BEST AND BELCHER.—Good progress is being made in the joint Gould and Curry west drift on the 2500 level. Work is also in progress in the east drift on the Con. Virginia line on the 1200 level.

YELLOW JACKET.—Sufficient ore is being extracted to keep the mills on the Carson in constant operation. The exploring drifts are finding a considerable amount of ore that will pay for milling.

COMBINATION SHAFT.—The Cornish pump at the 2900 level has been started up and prospecting operations will no doubt soon be resumed in the middle mines.

BELCHER.—The usual amount of ore is being extracted and sent to the mills, and considerable work is being done in the way of prospecting.

ANDES.—Some paying ore continues to be found, and the exploring drifts show a good deal of quartz that looks well and promises to carry ore.

SCORPION.—Work is progressing as usual in the main west drift on the 500 level. The rock remains about the same as heretofore noted.

SAVAGE.—All is now in such shape that prospecting may be resumed whenever the officers below give the word.

CON. VIRGINIA.—The east drift on the 2900 level is being advanced at the rate of about 30 ft per week.

Belmont District.

BELMONT.—*Courier*, June 26: Since my last report have advanced 200 level nine ft in good ore, showing two ft ore in the face. Stopes are above level from 30 to 35 ft, all yielding good ore. Stone cooling floor 106 by 30 it is completed. Building over the same will be finished next week.

Columbus District.

MOUNT DIABLO.—*True Fissure*, June 28: The west drift from winze No. 5 has advanced 71 ft, and shows small spots of ore. The east drift from the same winze is giving a little ore. The east drift from the north crosscut, west of the shaft on the third level, is now in 30 ft, and shows a strong ledge of low grade, with a little ore of good grade. The west intermediate, between the second and third levels, is now in 84 ft, and shows 18 inches of $35 ore. The raise from the south crosscut, from the east drift on the second level, has connected with the winze from the east drift on the first level, and an intermediate has been started from the raise. The east drift from the north crosscut, west of the shaft on the second level is 107 ft long, and shows 8 inches of $75 ore. The west drift in the intermediate between the first and second levels, is in 61 ft, and shows six inches of $60 quartz. An east drift in the same intermediate is giving some $90 ore from small streaks. The incline is now 167 ft below the third level. The east drift from the incline, that is to connect with winze No. 3, is in 30 ft.

Comet District.

GOOD PROSPECTS.—Pioche *Record*, June 21: The prospects in this district are reported by all who have visited them as possessing merit. The claim owned by Clark and Willett continues looking well, and the owners are taking out good ore. The Latimer boys are also taking out good ore, and the claim owned by Freudenthal gives promise of proving a valuable claim. The ledge is said to be about from two to three feet in width, and contains a streak of about eight inches that assays $140 to $450. The whole ledge, it is thought, will average about $80. The Burrows claim is also looking well.

Esmeralda District

WORK ON THE ESMERALDA BEGUN.—Walker Lake *Bulletin*, June 27: Last week Judge Seawell and John Neidy put a number of men at work on the Esmeralda. They are now taking out ore and have contracted with Governor Blasdel for the Humboldt mill for crushing. A large quantity of milling ore is in sight, which will pay well at the present cost of milling.

Grantsville District

INDIANAPOLIS.—*Bonanza*, June 28: Work was commenced on the Indianapolis mine last Monday under the superintendence of Ed. Cain. This is a move in the right direction. A silver mine cannot be made a bullion producer without the expenditure of money and muscle. From the past history of the Indianapolis there is every reason to believe that it will develop into a paying mine as work progresses. There are several mines around Ione equally as good as the Indianapolis languishing for lack of capital to develop them.

Reveille District.

LEADING.—Cor. Belmont *Courier*, June 28: Since my arrival in this place I have been running the leaching works for George E. Clarke and Joe Bianchi successfully. We have been out of hyposulphate of soda and for the last week have been idle. The team of John E. Norris is expected in at any moment from Eureka with a supply. Owing to the mismanagement of our mining interest and the withdrawal of capital therefrom, especially in Nye County, it behooves an old miner and prospector to say a few words on a subject connected with the interest of all.

We know that there are mines lying idle in Nye County that could be made immense bullion producers, and tend to the growth and prosperity of the County Seat and surrounding towns and ranches. An examination of ore bodies should be made by our merchants and business men, and, after correct assays are made thereof, sufficient assistance should be extended to the prospector or miner developing the same. By such a course, it seems to me, we can redeem the former prosperity of Nye County.

Secret Cayon District.

GEDDES AND BERTRAND.—Cor. Eureka *Sentinel*, June 27: West Bigbee, from New Mexico, who came here to examine the Geddes & Bertrand mine, went out to Secret Canyon Monday. Mr. Bigbee was greatly surprised, and agreeably so, to find such an extensive plant and a mine of such prospects. The mine has yielded to the company about $600,000 from the surface to a depth not exceeding 300 ft. Mr. Bigbee is pronounced in his opinion that the property is worth continued prospecting a 1,000 ft. for the reason that no such surface developments could be made independent of a great mine below. He thinks that with deeper prospecting large chambers of ore will be found to yield an ample supply for keeping the mill at work. He was surprised to hear that the company had not encouraged the working of more

custom ores, which he thought, would have aided greatly towards keeping the mill going. Judging from the extensive showing of profitable mineral country in the neighborhood of Secret and Eureka districts, generally, he does not think the leaching works are all too large. His attention being called to the great works at the Richmond, he said he thought its plan of receiving custom ore a good business for the company and for the camp, and he believed the Geddes & Bertrand could do a similar business in leaching. After inspecting the Geddes & Bertrand mine and mill our party went to look at Mr. Mitchell's mining property, which is about a mile south from the canyon. This property is marked by immense croppings and shows indications for extensive mines.

Taylor District.

MEX.—Pioche *Record*, June 21: There are some 20 men employed at Taylor, and prosperity seems to shed its golden rays on that camp.

Tuscarora District.

NORTH BELLE ISLE.—*Times-Review*, June 28: No. 2 crosscut, 350 foot level, has been extended a total distance of 100 ft, and 70-foot level drift north, has been advanced 10 ft. No material change in the above workings.

BELLE ISLE.—East crosscut, 450-foot level, has been extended 61½ ft; total distance, 144 ft. Work has been commenced on the joint Belle Isle and Navajo upraise on the "east" vein, 250 foot level.

INDEPENDENCE.—No. 3 upraise, 300-foot level, has been connected with the 175-foot level. The upraise has yielded the usual grade of ore during the past week. The 400-foot level drift west has been extended 18 ft. Will start a drift east this week on the same vein.

GRAND PRIZE.—The south drift on the 200-foot level has been advanced 26 ft, and south drift on the 300 level 31 ft. A raise has been started above the 400-foot level to connect with the 300, which is up 22 ft. Have commenced repairing the mill.

NAVAJO.—South drift from No. 1 crosscut, east vein, 250 foot level, has been advanced 9 ft; total length 109 ft. The face of the drift shows no material difference in the quantity or quality of ore from that of its entire length. North drift from same has been driven to the Belle Isle line, and work will now be commenced on a joint upraise on the vein to the 150-foot level. No. 1 upraise has been carried up 39 feet. The vein shows the usual width of high-grade ore. Winze from No. 1 crosscut, east vein, 150-foot level, has been sunk 10 feet; total depth 31 ft. Work in the chambers on the "west" vein continues to develop a large amount of low grade ores.

ARIZONA.

THE INDEPENDENCE STRIKE.—Tombstone *Epitaph*, June 26: The strike in the Independence mine, on Aunt Sally hill, is daily growing into greater proportions. Gus. Baron and J. H. Striedinger, who bought the Fields interest at administrator's sale recently for $500, would not dispose of that interest for ten times the amount. The strike is the most important made in this camp for twelve months, showing as it does a large body of high-grade ore in a place where nothing of consequence had hetetofore been produced. Mr. Baron, who was formerly foreman of the Toughnut, thinks he has the West Side ledge, while others think it a cross-ledge connecting the West Side and Contention lodes. No matter what it may be, it is a magnificent showing.

FROM THE MINES.—Cor. Prescott *Courier*, June 27: The Lane mine is in bonanza. Mine and mill are running. Dan Thorne, who knows the Silver Belt mine "like a book," says the general supposition that the ledge is small is false. The richest pay streak is not immense in size, but the ledge, proper, is very large. Our friend, W. R. Morgan, has, by request, contributed the following encouraging news about the Pine Spring and other mines in Turkey Creek district: We commenced work on the mine on the fifth of this month and have 400 sacks ready for shipping and will ship between now and the first of July. We took out a small nugget yesterday that weighs about one hundred pounds, solid metal. The Yankee Boy is looking fine; they are about ready to make their first shipment. The Wheel of Fortune, owned by W. R. Morgan, Tom McDonald and Lewis Armstrong, is showing up splendidly. Work was commenced on the property a few days ago. The Longfellow, owned by McCann & Co., is looking well; there are several fine prospects in the Longfellow district, the Hawkeye Sulphuret, Walla Walla, Longfellow No. 2, and others that I cannot think of their names. There has been a new strike between the Pine Spring and the Yankee Boy of good ore. The find was made by a prospector by the name of Alexander Dering. The Syndicate, north of the Pine Spring, is looking well as work progresses, and the boys are going for it as fast as they can.

THE KIMBALL.—Arizona *Miner*, June 28: The machine and machinery of the Kimball mill have been put in place on Lynx creek, and the mill will be put in operation on Monday next. Mr. G. W. Curtis has already some 300 tons of excellent gold rock with which to commence operations and the prospect is very flattering for a speedy run of most excellent bullion The mill hands will awaken the neighbors Saturday evening by their whistle. Some twenty men will be employed in and around the Kimball.

COLORADO.

PUEBLO'S NEW SMELTER.—Pueblo *Star*, June 23: In our round to-day we wandered over to the new smelter building, where we found Messrs. Clink, La Force and Vincent, the contractors, pushing things rapidly towards completion. The stone foundation is all done, with the exception of a small break, which was caused by the heavy rains recently. The brick walls, which are to be 20 ft high when completed, are now erected 15 ft. The rooms which are to contain the machinery are nicely arranged. The smoke flues are so arranged as to drive the smoke to rear end of the building when it winds around over a partition wall which contains a metal plate to catch the particles of mineral which would otherwise be carried off with the smoke. They will erect three furnaces to commence operations with, of a capacity of 60 tons each. The stack is one of the finest ever built in the State. It is built octagon shape and will be 150 ft high when completed, it being 120 ft at the present writing. The foundation of this stack is of stone 22 ft square, with a brick base of 16 ft square and four ft thick. The contractors think they will complete the entire brick and stone work in about three weeks. Mr. Mark Hodgson, formerly of Michigan, but late of Alma, is the general manager of the concern, and is well pleased with the outlook for the new plant. Mr. L. W. Morgan, of Swansea, Wales, is Supt. Mr. Morgan is a graduate in metallurgy and is said to be one of the most practical smelter men in the State. The track has been completed from the Steel Works to the smelter and the laying of water pipes commenced several days ago.

EXCHEQUER DISTRICT.—Is situated some twenty-five miles easterly from Providence, is a new camp of much promise, the ores rich and ledges well defined. The Cashier, owned by some of the citizens of this place, under the management of Levi Blackburn, is down about 50 ft, with a considerable quantity of ore on the dump that the owners are confident will work 100 ounces per ton. They also have a small lot that assays 400 ounces per ton in silver. Everything looks encouraging. Six to eight men at work.

IVANPAH.—Ally is working quite a force of men taking out high grade ore, for which the old camp is so famous. The mill will commence crushing as soon as Mr. Bidwell returns from San Francisco. The McFarlane Bros.—Billy and Tom—are working a rich mine some twelve miles eastward from Ivanpah. They have considerable high grade ore ready for shipment in a short time. Tom McFarlane passed through Daggett last Saturday enroute for the mine and Pahrump.

LEADVILLE'S ORE PRODUCTION.—*Herald*, June 28: The daily ore production of Leadville, excluding iron ore, is much larger than is generally estimated by most persons, and 50 per cent greater than reported by our contemporary. The daily output aggregates at least 970 tons as follows: Iron Hill and California Gulch mines, 300 tons; Printer Boy and Rock Hill mines, 100 tons; Carbonate Hill mines, 200 tons; Fryer Hill mines, 115 tons; Yankee Hill mines, 85 tons; Little Ellen Hill mines, 100 tons; Sugar Loaf, Big Evans Gulch and other sections, 70. Total, 970. With the advancement of the summer season this output will increase, and it is reasonable to presume that during July the output of the Leadville mines will average at least 1,110 tons per day, which, compared with last year's production for the same month, will show a slight increase. With the exception of Iron Hill, which shows a marked falling off, all other sections are doing very well. By the suspension of the Silver Cord mine and the decreased productions of the Iron Silver properties, a loss of at least 10,000 tons a month is sustained—a very considerable amount to be regained by the other sections of the Leadville district. The hills that show a notable gain in their production this year, compared with last, are Yankee, Printer Boy and Rock. The difficulty with the smelters is not so much in the lack of ore as in the absence of ores running high in lead, without which dry ores cannot be smelted. The smelters at present are paying good prices for ore running in lead, and in a short time the objection to mining lead ore on account of the low price of lead will be obviated, and the majority of our smelters will again have all their furnaces in blast. At the present time, out of the 24 furnaces in the city, 16, or two-thirds, are doing service, while a fortnight ago only one-half of the total number were in blast. We believe it is safe to estimate that by the middle of July four-fifths of the furnaces in the camp will be in operation, and while the amount of base bullion produced daily will not be as great as it was at this time last year, the value of the bullion will be higher, and the value of the bullion production in excess of that of the same period of 1883.

IDAHO.

BIG YIELD.—Wood River *Times*, June 26: The Vienna mill has now been working for nearly a year, and to-day two bars of its bullion were received at the express office here. These bars were number 149 and 150, respectively. As they are worth $1,500 on an average, this indicates a yield of about $250,000 for the year. As the mill was entirely new and the ore rather difficult to work, this is a very good record, but one that will doubtless be surpassed this year, now that the nature of the ore is better understood.

ABOUT TO CHANGE HANDS.—There is some likelihood of the Idaho Democrat mine, above Smith's Springs, changing hands soon. The sum of $1,000 has already been paid as an earnest of intention, and an additional payment is due soon, which is expected to be made. If it is, the new owners will take possession at once, put on a strong working force and begin shipping ore.

ANOTHER STRIKE.—Judge Lawrence came in Saturday, evening, to inform his pardners of the new strike he recently made in the Cyclops claim, situated on the Bullion divide, half-way between the Narrow Gauge group and the Wolftone mine. It consists of 18 inches of steel galena, which is evidently high grade. The new strike was made about 400 ft away from where the Porter Brothers made their strike a short time ago, and on the same ledge. It is therefore probable that the ore body is continuous from the Red Cloud—which is the name of the Porter Brothers, claim—to the Cyclops. The Red Cloud ore carries an average of 125 ounces silver and 65 per cent lead.

AT VIENNA.—For a couple of weeks past little or no bullion has been shipped from Vienna. This is due to the influx water in the Vienna mine, which, with the Mountain King, is the only mine up there in shape to yield ore in large quantites at present. The Vienna ore works freely, but the King ore is exceedingly base, and quite low grade. It requires to be roasted, and as the furnace cannot keep the stamps supplied with roasted ore, over half of the crushing capacity of the mill is idle. About 100 men are employed by the Vienna and Mountain King at present but by the Fourth of July this force will be increased to about 150. In addition about 100 men will be employed most of the summer in chopping wood and timber for lagging, and probably 50 men will be employed on the Solace, Lion, Nellie and other mines near the town—so that it is safe to say that during most of the present season, about 350 men will find employment in and around Vienna. This need not encourage any one to go up there in search of employment, however, as there are dozens of idle men there already.

DREAM GULCH.—Cœur D'Alene *Eagle*, June 26: Dream gulch still maintains its position as the banner gulch of the camp. The cleanup of last Sunday was something astonishing, being up into the pounds. The actual weight of the cleanup for a 72 hour run was 18½ pounds, 3 pwt. and 7 grains. A nugget was found in the cleanup that weighed 19 ozs., 11 pwt. and 3 grains. It measured 3¼ inches long and 2½ inches wide at the widest part and about half an inch in thickness, irregular in shape and slightly impregnated with quartz. They made another cleanup Tuesday evening of 280 ounces after a forty-eight hour run. The Alder gulch people threaten to shut off the water from Dream gulch as they need it all themselves, and the Dream Gulchers are running a preliminary survey for a new ditch to tap Pritchard creek near Butte city.

THE MOTHER LODE.—We made a visit last Wednesday to this famous ledge, and found the proprietors busy at work putting in new timbers preparatory to driving the tunnel ahead to develop the ledge. The water is down to a stage, which exposes the ledge matter four ft lower than it has ever been visible before; and all the way down, the same wonderful exhibit of massive chunks of gold embedded in the quartz, is exposed. It is a truly wonderful sight and is the astonishment of all beholders.

GOLD RUN.—Gold Run is the first gulch above Murray and promises to be equal to any of the gulches, when a little more development work has been done. All the claims along the gulch are being represented by solid work, notably claim No. 4, owned by Messrs. Brown, Beers, Jennings and Rupert, who purchased the claim about three weeks ago. They have already got a string of sluices running and have so far taken out enough to pay expenses and leave a surplus. They have not yet struck bedrock. They intend to put on a hydraulic as soon as the contemplated ditch along the ridge is completed.

WM. DEMPSEY PLACER.—*Eagle*, June 26: This placer adjoins the Maggie D. A large drain ditch has been cut and a shaft 10x12 and about 13 ft deep has been sunk. The lumber has all been whipped out for sluice boxes. Mr. Dempsey has now on the way a large steam pump which he intends putting in the shaft and finding bedrock if it is anywhere this side of Gehenna. The development of this claim will be watched with eager interest by the claimholders along the creek, as it will demonstrate beyond a doubt, the feasibility of steam over the primitive method now in vouge, and if anything like the anticipated results are obtained, steam pumps and hoisting works will cease to be a novelty along Pritchard and Eagle creeks.

AURORA PLACER.—The Aurora is situated on the hill trail to Murray, and is owned by Messrs. Hitch, Ball, McKenzie and Coy. They have a drain ditch 400 ft long, averaging 14 ft deep, and a shaft 16 ft deep. They will have a 16 foot water wheel and a China pump to work on the shaft in a day or two and intend to stay by it till bedrock is reached or the bottom drops out.

LOW'S FRACTION.—This claim is a fraction adjoining the Aurora and is owned by Messrs. Smith, Alexander, Vaughn, Workman, and the Williams Bros. Development work has not been commenced in good earnest yet, though the boys have not been idle by any means. Over $2,000 have been expended in constructing dams and turning water preparatory to active development.

THE FRANK GROVE.—The Frank Grove placer is owned by Messrs. Grove, Likely and the Hay Bros. and adjoins the Jupiter. A drain ditch has been dug the length of the claim to turn Pritchard creek and averages ten ft in width and five ft in depth. They intend to work in the old channel of Pritchard, but the high water has compelled them to suspend operations for the present.

THE GELLET.—The Gellet adjoins the Frank Grove. They have the sluice boxes set and a drain ditch 100 ft on the upper end of the claim, and before our next issue, will be able to show up dust. On the lower end of the claim, a drain ditch between six and seven hundred ft long with a face of 12 ft has been dug.

THE WYANDOTT & PETERS.—This claim adjoins the Geilet and is owned by Stewart & Co. They are working 13 men and have constructed a drain ditch 1,000 ft long by 18 ft deep and have blasted seven ft into the bedrock. They are now timbering the ditch and intend letting Pritchard creek run through before the week is over.

THE LAST CHANCE.—The Last Chance is owned by Capt. Wooten & Co. and is situated on the creek opposite the Wyandott. They will be running three strings of sluices the first part of the coming week. They are working eight men at present and have about 400 ft of drain ditch.

MEXICO.

NEW PLACER MINES IN SONORA.—A letter from the town of Caborca, Sonora, dated June 20th, says: Within the past five days, near the "Polomas" (Feather), a very rich section of placer ground has been discovered that is attracting considerable attention, and merchants are abandoning their business and, with the inhabitants, are flocking to the new placers, leaving the town almost deserted. There are fabulous stories told of the richness of the placers, and everyone who returns from there brings more or less gold, increasing the excitement. Nearly all of our merchants have left with cargoes of provisions and merchandise.

MONTANA.

MAGINNIS MINING CO.—Maiden *Argus*, June 26: On June 3d the company incorporated under the laws of Montana, the incorporators being S. T. Hauser, A. M. Holter, Geo. H. Hill, A. K. Barbour and A. M. Esler. The capital stock is fixed at $500,000, divided into 100,000 shares at $5 each. The company decided to commence all proposed improvements at once, and have the new mill running by August 31st. Fully $20,000 will be expended in the next few weeks in machinery, buildings, etc. The machinery decided upon will consist of a double oscillating Huntington mill with a capacity of from fifteen to twenty tons per day, being equal to a 10-stamp (drop stamp) mill; concentrators and amalgamators, and a 50-horse-power engine of Cincinnati manufacture. The concentrating and amalgamating machinery is being manufactured by the well-known house of Fraser & Chalmers, of Chicago. The main building, the grading for which was inaugurated this week, will be 40x80 ft, 2½ stories high, constructed to accommodate more and varied machinery should it be needed, at a future date. Tom Fisher, of Helena, has been engaged to take charge of the construction of the mill. It is the intention of this company to treat custom ore as soon after starting up as arrangements can be made. Mr. Esler estimates that the company will employ, as mill men and miners, between forty and fifty hands, in addition to a number of wood choppers. It is expected the new building will begin to go up the latter part of next week. With the prosecution of work by this company and the early advent of the smelter of the Maiden Reduction Co., our camp will certainly enjoy a degree of prosperity that will give it a decided boom.

NEW MEXICO

LAKE VALLEY RICHES.—La Vegas *Gazette*, June 28: One year ago there was a wail over the failure of ore in the Lake Valley mines. It was said by those who were supposed to know that there were only a few surface pockets, the greatest of which was the celebrated "Bridal Chamber;" and that, they being exhausted, the property was worthless. A former manager of these properties stated that there was nothing in them. Other men thought differently; they believed the mines had been badly worked and that while millions of ore were being taken out, no prospect work was being done at all. With a new regime, honest prospecting began and at once there was opened up several good bodies of ore, which have steadily improved. At that time the Sierra Bella company was $100,000 in debt and there was only a small output. To-day it is out of debt, a dividend of 15 cents per share has been paid, expensive machinery has been placed and there is a good working surplus in the treasury. The Sierra Grande Co. has every reason to feel jubilant over the recent opening up of new and enormous ore bodies. At one point their is in sight 30 ft of ore that averages over $30 to the ton and four ft of $100 ore that contains numerous rich pockets of very high grade chlorides. In the first 12 days of June $68,000 was taken out and the output will probably continue in the same proportion during the summer. One dividend is in hand and another in sight. The best improved machinery is in use in all the workings. With steam hoist and rock drills it is not extravagant to say that silver is pouring out of the mines. The track of the A. T. & S. F. branch has been built up to the very dump on the Bella ground, thus affording shipment at the minimum expense. It is now possible to ship ore which has previously been kept at home. The mill is now being improved and repaired, and with the recent edition of eight Frue Vanners for concentrating, there is not a better plant anywhere in the west. Dr. Taylor is in charge and his ability is well known. The credit for having brought the Sierra mines to their present excellent condition is due to Dr. F. M. Endlich, the manager, and to Daniel Ferguson, the Supt. Both are thorough miners and have succeeded in the places of other men who have failed. With the astonishing improvement in these properties has come a stronger confidence in mining throughout this section. There are few good properties that lie unworked, and the the output from New Mexico for the present year will be twice as large as it was last.

NOTES.—*Inter-Mountain*, June 28: The Posei is now being worked by a full force and is producing a better grade of ore than at any previous time. It is being treated at the Silver Bow mill. The main shaft of the Colusa is now 30 ft below the 400 foot station and will be sunk to a depth of 600 ft with all possible expedition. Operations in the Moulton are confined to the stopes and faces in the west drifts from the 200, 300 and 400 stations. In the 500 foot drift the ore is somewhat low grade, the main shoot not having yet been encountered in driving westward. The south vein of the Alice continues to produce the bulk of the output from that mine. Very little is being done on the north or main vein, nearly all the ore having been worked out as far as explored. The east and west drifts on the north and south veins of the Mountain View are being actively forwarded and the ore dump is rapidly assuming mammoth proportions.

UTAH.

REVIEW.—Salt Lake *Tribune*, June 27: The receipts of bullion and ore in Salt Lake City for the week ending June 25th, inclusive, were $121,738.90, of which $116,888.96 was bullion, and $4,850 ore. The receipts of the week previous were $140,152.68 in bullion and $5,000 in ore. The output of the Horn Silver for the week was 19 cars of bullion, $57,000, bringing the receipts of the year up to $1,097,000. The shipments of the Ontario, for the current week amounted to fifty bars, of the value of $37,680.63. One car of ore was shipped during the week. Total product of the Ontario this year, to date $760,529.67. The usual dividend of fifty cents a share, amounting to $75,000 has been declared the present month, payable in San Francisco or New York. The dividends of this mine now amount to $5,600,000. The Crescent works on tramway and sampling works are to be pushed with vigor, and the present season will put the company in condition, to defy the weather in its handling of ores. Two cars of ore were received from the Crescent during the week, valued at $4,850. A contract has been let to Mr. William Conner to drive a tunnel 250 feet on the Crystal mine, in the Big Cottonwood district. This property is owned by Salt Lake parties. Mr. Conner will start work on his contract as soon as he can get over in that part of the country with supplies. The Stormont sent up two bars of silver $3,420. The product of the Hanauer smelter for the week amounted to six cars of bullion, $14,295.

PARK NOTES.—*Record*, June 28: The Crystal property, spoken of in our last issue, was sold to Salt Lake parties by Mr. Wm. Conner. The Sampson company began sinking again on their shaft to-day. The pumps have the water under control, and they expect to be able to keep at work on the shaft in the future. Work has been started on the Dundee mining claim by Terry Brogan with a force of five men. He intends pushing work right along this summer. This claim is situated south of the Sampson. The contract for supplying ties for the new tramway, and for lagging for the Crescent, has been left to H. O. Young. Mr. Young has set quite a force of men at work, and will begin filling the contract immediately.

THE JENKINS STANDARD PACKING

IS ACKNOWLEDGED BY USERS AS THE BEST in the world. Unlike all other Packings, the **Jenkins Standard Packing** can be made any thickness desired in a joint by placing two or as many thicknesses together as desired, and following up joint, it vulcanizes in place and becomes a metal of itself (it is frequently called Jenkins Metal), and will last for years, as it does not rot or burn out. Avoid all imitations, as a good article is always subject to cheap imitations. The **genuine** has stamped on every sheet "**Jenkins Standard Packing**," and is for sale by the Trade generally.
For Sale by DUNHAM, CARRIGAN & CO., San Francisco, Cal.
Manufactured only by
JENKINS BROS., 71 John St., New York.

Dewey & Co.'s Scientific Press Patent Agency.

OUR U. S. AND FOREIGN PATENT AGENCY presents many and important advantages as a Home Agency over all others, by reason of long establishment, great experience, thorough system, intimate acquaintance with the subjects of inventions in our own community, and our most extensive law and reference library, containing official American and foreign reports, files of scientific and mechanical publications, etc. All worthy inventions patented through our Agency will have the benefit of an illustration or a description in the MINING AND SCIENTIFIC PRESS. We transact every branch of Patent business, and obtain Patents in all countries which grant protection to inventors. The large majority of U. S. and Foreign Patents issued to inventors on the Pacific Coast have been obtained through our Agency. We can give the best and most *reliable* advice as to the patentability of new inventions. Our prices are as low as any first-class agencies in the Eastern States, while our advantages for Pacific Coast inventors are far superior. Advice and Circulars free.

Mining Books.

Orders for Mining and Scientific Books in general will be supplied through this office at published rates.

Size of Shafts.

The average size of shafts now being opened in the anthracite regions of Pennsylvania is considerably larger than in former years. This change has resulted from several causes. Greater depth of shafts is required to open undeveloped coal in the deeper portion of the main basins, which necessitates larger cross section to secure better ventilation for these more gaseous mines. The policy now adopted of opening one large colliery in preference to two small mines necessitates better hoisting facilities.

The width of shafts is usually governed by the length of the mine cars, which ranges from 9 to 10½ feet; hence the width usually adopted is 10, 11 and 12 feet. The length is governed by the number of compartments and by the area of air-way needed. The compartments are now made from 6 to 8 feet broad inside the buntons, on average of about 6½ feet between the guides; hence the compartment, measured between the centers of the buntons, is usually from 7 to 9 feet. The length, therefore, varies from 16 to 20 feet for a shaft with two compartments, 30 to 38 feet for a shaft with four compartments (22 to 36 feet being the ordinary length for three compartments), and 44 to 52 feet for a shaft with six compartments. When this large number of compartments is provided, two are usually used for an up-cast air-way, and for the pump rods and column pipe, and in some cases one is used with hoisting compartments as a down-cast, while at other shafts two extra hoisting compartments are held in reserve for future requirements. The shafts in the anthracite region are rarely more than 800 feet deep, and their average depth is probably between 300 and 400 feet. Some very large shafts are made. One is 13x52 another 53x10, and still another 12x47.

When the opening is on ground covered with a moderate depth of soil, a rectangular pit is sunk to bedrock, from 4 to 8 feet wider than the proposed shaft, and this is then solidly timbered up or built up with stone curbing.

Mining Share Market.

There is very little doing in stocks this week, and the two holidays at the end of it make stocks matters still more dull. The Mexican deep winze is now fairly under headway for the 3300 level. The winze was timbered close down to the bottom at the time when it was first opened and before it was decided to push on down to the 3300 level, therefore in resuming work it was necessary to be very careful in blasting in order not to knock the timbers to pieces.

The diamond drill is being run in the north drift on the 3100 level of the Sierra Nevada, and has tapped quite a strong flow of water. Heretofore the ground in that direction has been quite dry. The present flow is probably from a small pocket of water that will soon run out.

At the Ophir they will soon start a drift from the main shaft at the 500 level, which will pass in under the bottom of the old Mexican shaft and drain all the old upper levels.

A good deal of prospecting is being done on the 1200 and 2500 levels of the Best and Belcher and Gould and Curry mines.

The Cornish pump having been put in place at the 2900 level of the Combination shaft, prospecting will now become active in the middle mines. They will probably resume work on the 2800 level of the Hale and Norcross in the first week in the next month. Ore from the 200 level is now being shipped to the Eureka mill, Carson river for reduction.

The several leading mines of Gold Hill are shipping about the usual amount of ore to the mills on the river.

Don't Wait to be Called On.

Our subscribers can do us an essential favor by sending their subscriptions to this office without delay. Please do not wait to be called on. We have actual need of all subscriptions due or over due. Prompt payment in advance alone will enable us to continue the publication of a first rate paper.

COMPLIMENTARY SAMPLES OF THIS PAPER are occasionally sent to parties connected with the interests specially represented in its columns. Persons so receiving copies are requested to examine its contents, terms of subscription, and give it their own patronage, and, as far as practicable, aid in circulating the journal, and making its value more widely known to others, and extending its influence in the cause it faithfully serves. Subscription rate, $3 a year. Extra copies mailed for 10 cents, if ordered soon enough. Personal attention will be called to this (as well as other notices, at times), by turning a leaf.

Scientific, Mining and Other Valuable Books.

PUBLISHED OR IMPORTED, WHOLESALE AND RETAIL, BY DEWEY & CO., MINING AND SCIENTIFIC PRESS OFFICE, S. F.

BY GUIDO KUSTEL,

MINING ENGINEER AND METALLURGIST.

CONCENTRATION OF ORES (of all kinds), including the Chlorination Process for Gold-bearing Sulphurets, Arseniurets, and Oold and Silver Ores generally, with 120 Lithographic Diagrams. 1867.

This work is unequaled by any other published embracing the subjects treated. Its authority is highly esteemed and regarded by its readers; containing, as it does, much essential information to the Miner, Millman, Metallurgist, and other professional workers in ores and minerals, which cannot be found elsewhere in print. It also abounds throughout with facts and instructions rendered valuable by being clearly rendered together and in simple order. It contains 120 diagrams, illustrating machinery, etc., which alone are of the greatest value. PRICE, $7.50.

ROASTING OF GOLD AND SILVER ORES (Second Edition) and the EXTRACTION of their Respective Metals without Quicksilver. 1880.

This rare book on the treatment of gold and silver ore without quicksilver, is liberally illustrated and crammed full of facts. It gives short and concise descriptions of various processes and apparatus employed in this country and in Europe, and the why and wherefore. It contains 156 pages, embracing illustrations of furnaces, supplements and working apparatus. It is a work of great merit, by an author whose reputation is unsurpassed in his specialty. PRICE, $3, coin, postage free.

To Architects and Builders.

Valuable Vault for Sale at a Bargain

A contractor has a thoroughly burglar-proof vault for sale. Dimensions, 4½x5 ft.; hight, 7 ft. in the clear; weight, about 6,000 lbs. In perfect order throughout. Double doors inside. Single burglar-proof outside door, 1½ inch steel and iron combined. The bolt work is of superior and first-class quality in all respects, there being no better on this coast. Can be examined at any time. Write for further information. Address P. H., box 2361, S. F. P. O., or inquire at this office.

First-Class Stationary Engine For Sale.

Right or left hand; 10½x24 inch cylinder; fly wheel 3,500 pounds; nearly new and all in perfect order. Will be sold at a great sacrifice for want of use. Terms of payment easy; on installment plan, if desired. Original cost $1,200. Can be seen in position any day. Address H. M., box 2361, S. F. P. O.

ASSESSMENT NOTICE.

Gould & Curry Silver Mining Company.

ASSESSMENT No. 48.

Levied ..... June 6, 1884.
Delinquent ..... July 11, 1884.
Day of sale ..... August 4, 1884.
Amount ..... Fifty cents per share.

ALFRED K. DURBROW, Secretary.

OFFICE—Room No. 69, Nevada Block, No. 309 Montgomery street, San Francisco, Cal.

DIVIDEND NOTICE.

The German Savings and Loan Society.

For the half-year ending June 30, 1884, the Board of Directors of the GERMAN SAVINGS AND LOAN SOCIETY has declared a dividend on Term Deposits at the rate of four and thirty-two one-hundredths (4 32-100) per cent per annum, and on Ordinary Deposits at the rate of three and six-tenths (3 6-10) per cent per annum, payable on and after the 1st day of July, 1884. By order

GEO. LETTE, Secretary.

California Inventors

Should consult DEWEY & CO., AMERICAN AND FOREIGN PATENT SOLICITORS, for obtaining Patents and Caveats. Established in 1860. Their long experience as journalists and large practice as patent attorneys enables them to offer Pacific Coast inventors far better service than they can obtain elsewhere. Send for free circulars of information. Office of the MINING AND SCIENTIFIC PRESS and PACIFIC RURAL PRESS, No. 252 Market St., S. F. Elevator, 12 Front St.

PATENTS AND INVENTIONS.

List of U. S. Patents for Pacific Coast Inventors.

From the official list of U. S. Patents in DEWEY & Co.'s SCIENTIFIC PRESS PATENT AGENCY, 252 Market St., S. F.

FOR WEEK ENDING JUNE 24, 1884.

300,843.—FIRE ESCAPE.—J. H. Burks, Los Angeles, Cal.

300,765.—CAR COUPLING—Compton & Lane, Williams, Cal.

301,046.—CAR COUPLING—Coon & Hahn, S. F.

300,772.—CARRIAGE FOR GARDEN HOSE—Geo. Grisel, Oakland.

301,060.—SEWING MACHINE—Edw. Kohler, S. F.

300,881.—WINDOW SCREEN—E. E. Masters, Sacramento.

300,925.—FRUIT DRIER—W. A. Mecker, S. F.

300,804.—AMPLIFIER—Geo. F. Schihl, Vallejo.

300,810.—SAFETY HOOK—E. H. Smith, Rutherford, Cal.

301,074.—SUPERHEATER FOR ENGINES—J. Ch. H. Stut, S. F.

301,038.—SCREW AND TOGGLE LEVER PRESS—Wm. H. Worth, Petaluma.

NOTE. Copies of U. S. and Foreign Patents furnished by DEWEY & Co., in the shortest time possible (by telegraph or otherwise,) at the lowest rates. All patent business for Pacific coast inventors transacted with perfect security and the shortest possible time.

Notices of Recent Patents.

Among the patents recently obtained through Dewey & Co.'s SCIENTIFIC PRESS U. S. and Foreign Patent Agency, the following are worthy of special mention:

GRAIN SEPARATOR.—Pontalia L. Nash, Hollister. No. 295,668. Dated March 25, 1884. The improvements covered by this patent mainly consist of certain details of construction difficult of intelligent description without the aid of engravings.

WATER COOLER AND REFRIGERATOR.—Clayton S. Richman, Vallejo, Marin Co. No. 300,511. Dated June 17, 1884. This water cooler has a movable top and reservoir, outlet pipe and spraying vessel, combined with a drawer valve, discharge cock and ice chamber, and a rod connecting the said cocks, by which they are operated simultaneously.

SCREW AND TOGGLE LEVER PRESSES.—Wm. H. Worth, Petaluma. No. 301,038. Dated June 24, 1884. This invention relates to improvements in cider, cheese, wine or other similar presses in which double toggle levers are employed, with a right and left hand screw shaft, by which they are operated; and it consists in a means for keeping the power and strain of the press in a right line, so ae to avoid all cramping and warping of the parts.

FARM GATE.—Edwin D. Rathbun, Williams, Colusa Co., Cal. No. 295,674. Dated March 25, 1884. This invention relates to that class of gates which are opened and closed by the operation of levers on the side of the doorway, and it consists in the novel construction and arrangement of the devices for operating the gate and the latch, and in a peculiar guard to prevent the gate from being opened except by the proper means.

SAWMILL.—Peter McG. Chisholm, San Francisco. No. 300,216. Dated June 10, 1884. This patent covers an improvement in sawmills, consisting in a portable frame, a pawl and rachet mechanism for adjusting the set beam, a friction with a boxing for friction shaft, an adjustable box for the saw shaft, and a guard for the saw. The object of the invention is generally to render more perfect and operative the several parts.

VEHICLE.—Jacob Price, San Leandro. No. 297,714. Dated April 29, 1884. This improvement in vehicles consists of a frame, the side pieces of which are formed of continuous bars of flanged or angle iron, with lugs for the attachment of the seat or other parts, and curved strengthening ribs at the points where bends are made. This frame is designed specially for phaeton village carts and light-riding carriages. The side bars are shaped to form the body.

COMBINED BUCKLE AND RING.—James B. Sayre, Sacramento. No 299,271. Dated May 27, 1884. This is a new and useful buckle and ring for harness; more especially for halters. It consists in a novel arrangement and construction of the buckle frame, tongue-keeper, ring and guide lip between the ring and keeper. The device has for its object the saving of expense and at the same time the attainment of the best results of a single ring and for a proper direction and equalizing of the strain.

DRY CLOSET.—Thomas W. Jackson, S. F. No. 299,226. Dated May 27, 1884. This is one of that class of closets in which some auxiliary means or substance such as dirt, sand, ashes, earth, etc., is employed to obviate the offensiveness of excrement. It consists of a peculiar endless receptacle mounted under and adapted to receive the feces from a closet seat, a novel means for depositing on said receptacle with the feces, such substances as ashes, earth or sand; means for drying the contents of the receptable and ventilating it, and a mechanism for causing the movement of the endless receptacle, whereby its contents are carried forward and discharged. The object is to provide a convenient and dry closet, the excrement from which may be discharged readily and without offense and at the same time is valuable as a fertilizer.

POULTRY FOUNTAIN.—John C. Tappeiner, Bisbee, Arizona. No. 294,932. Dated Mar. 11, 1884. The invention relates to certain improvements in poultry fountains of that class in which water contained in a reservoir is allowed to escape by degrees into a shallow pan. The top of the reservoir is provided with a removable cap and a perforated vessel is fixed or suspended within the reservoir. There are certain combinations of devices which go to make up the invention.

EARTH BORING AUGER.—Camille de Mezor ville, Santa Clara, Santa Clara county. No. 300,053. Dated June 10, 1884. This is a new and useful device for boring holes in the earth for trees or posts, and it consists in a wheeled frame carrying the earth auger, the shank of which is a screw, upon which are fitted a nut and washer, each of which is adapted to receive a pole or lever for operating them to cause the insertion and withdrawal of the auger, the power being applied in a single direction.

WINDOW SCREEN.—Egbert E. Masters, Sacramento. No. 300,881. Dated June 24, 1884. This consists in an ordinary window frame, provided with the usual sliding sashes, and having located between them, and adapted to slide on the parting-strip throughout the length of the window, a screen-sash. A peculiar jointed and removable parting-strip, which allows the ready insertion and removal of the screen-sash, and the construction of the screen-sash itself, are details of construction forming part of the invention.

SOLDERING MACHINE.—Mathias Jenseu, Astoria, Oregon; assignor of two-thirds to John Fox and Alsey L. Fox, same place. No. 300,084. Dated June 10, 1883. This is an apparatus for soldering cylindrical cans and similar articles. It consists of a circular bed, within which the solder is melted by means of a fire beneath it, a central revolving disk with arms projecting from its edge, and a mechanism by which it is revolved, so that the cans which are delivered into the space between the arms from a chute will be rolled around the edge to be soldered within the melted solder in the bed or pan, and after completion will be discharged through another chute.

HORSE DETACHER.—Octave Dupas, San Rafael, Marin county, Cal. Assignee of one-half to Isaac Shaver, same place. No. 300,056. Dated June 10, 1884. This apparatus is intended for detaching or clearing a horse from the shafts and whiffletree of a wagon when said release becomes necessary for the safety of the riders, upon the horse running away or becoming frightened. The apparatue consiste in a pointed latched hook on one end of the whiffletree, and a peculiar bevelled hook on the other, and of a spring releasing guard on the ehafts through which the breeching of the harness is passed. The horse can be released in the easiest manner and accident or injury prevented. Thie device is applicable to buggies, carriages or other vehicles, and may be used with shafts or poles, for single or double teams.

COMBINED PEN HOLDER AND BLOTTER.—J. J. Franklin Miller, Oakland, No. 296,668. Dated June 3, 1884. This combined pen-holder and blotter consists of a pen-holder having secured to the top of its staff a light frame, a plate carrying a blotting pad. Its object is to facilitate the work of book-keepers, accountants, entry clerks and those whose work demands the writing in various parts and places, of small entries and the turning of sheets and pages. The blotting sheet, of all the articles about a desk is the most easily mislaid or covered up, and no small loss of time and considerable vexation are occasioned by a search for it. This inconvenience is particularly noticeable to those who have but a few words or figures to write here and there. With the blotter attached to the pen-holder, where it cannot be mislaid, its use ie convenient and rapid.

CABLE GRIP.—Ralph W. McGovern, S. F. No. 300,492. Dated June 17, 1884. In the usual construction of grips of cable roads there are two compressing jaws between which the cable is clamped; but the clamp cannot he put on with full force instantaneously or it would jerk the car in starting. The cable slips slightly through the grip and of course wears the cable. Rollers have been employed but are not entirely satisfactory. Mr. McGovern's invention is designed to overcome the difficulties of the present system and prevent slipping. It consists in suitably mounted and operated rollers or pulleys between which the cable is gripped, said rollere being either eccentrically mounted or provided with eccentric or cam-shaped faces, and geared together in pairs, whereby their eccentricity ie made to correspond to bind the cable and supplement the clamping pressure by which they first take hold of the cable. It further consists in novel mechanism for operating the gripping rollers, and in various details of construction.

PLOW.—John A. Bilz, Pleasanton, Alameda Co., No. 299,195. Dated May 27, 1884. This is one of that class of plows known as vineyard plows which are especially adapted for vineyards and orchards, where it is necessary to get the share close to the vine or tree without injuring its branches. The invention consists in a peculiarly bent or curved beam mounted in bearings, and adapted to turn or revolve therein, in laterally adjustable handles, and in a novel whipple-tree. The object is to provide a plow in which, by turning the team, the line or draft is moved to one side, to prevent the horse from injuring the vine or tree by allowing him to clear the branches while the share works up close under them, and to give the same advantage to the driver by moving the handles to one side to get them in the line of the draft. The whipple-tree is arranged so it can do no injury by contact with the trees.

Mining and Scientific Press.

THE MINING AND SCIENTIFIC PRESS is the leading mining journal in America, and enjoys a larger circulation among the more intelligent operators and workers in the gold fields of the world.

Established in 1860, it has firmly maintained its position as a reliable, progressive journal. The information given in its columns has saved millions of dollars to the practical miners, metallurgists, mill men, mine and share holders on the Western side of our continent.

Among its contributors are the ablest and most experienced mining engineers, superintendents and practical miners in this country.

The PRESS gives a condensed summary of Mining News from the most important mining districts of the country.

New processes and methods of mining are described in its weekly issues. New mining machinery and improvements are frequently illustrated and explained in a manner to be of great value to all interested in mining.

As a scientific and mechanical representative of the Pacific Coast it is decidedly popular, and a standard journal with the most thrifty industrial people of the Pacific States and Territories. Its authority is of the highest order, and its usefulness in its special sphere unrivalled.

Every public library, mining engineer, metallurgist, mining operator, and intelligent mechanic and manufacturer, will find profit by its reading.

Subscription, $3 a year in advance. Sample copies, prepaid, 10 cents.

DEWEY & CO., Publishers.

No. 252 Market St., San Francisco, Cal.

Secure the Reduced Rate.

After the first of April, 1884, we announced a reduction of the price of the MINING AND SCIENTIFIC PRESS from $4 to $3 a year to all who would settle up arrearages at old rates and pay *in advance* thereafter. There are some who have not yet taken advantage of this offer, and we would therefore urge all subscribers still in arrears to remit what is due us to this date, at the rate of $4 a year, and pay in advance for another term at the reduced rates for new subscriptions paid in advance.

THE PALISADE FURNACE.—There are 300 tons of ore at the Palisade furnace. Two car loads of flux ore were shipped there from Mineral Hill a few days ago. The furnace will now start up within three or four days more, everything being got in readiness for the work of reduction. It is calculated that the ores from Shroeder District and a large quantity from Mineral Hill can be worked at a profit in the Palisade furnace. Its starting up is awaited with interest. It is an important event to the northern part of the country.—*Eureka Sentinel.*

Don't Fail to Write.

Should this paper be received by any subscriber who does not want it, *or beyond the time they intend to pay for it*, let them not fail to write us *direct* to stop it. A postal card (costing one cent only) will suffice. We will not knowingly send the paper to anyone who does not wish it, but if it is continued, through the failure of the subscriber to notify us to discontinue it, or some irresponsible party requested to stop it, we shall positively demand payment for the time it is sent.

Cheap Ore Pulverizer.

There is for sale in this city, by I. A. Heald, American Machine and Model Works, 111 and 113 First street, a Rutherford Pulverizer, an improved revolving barrel crusher, which was only used a few times and is as good as new. It will be sold very much below costs, and miners who are in need of such an appliance for a small mine will do well to make inquiries concerning it. It is suitable for a pulverizing mill for powder or other substances. References as to above can be had upon applying to this office.

IMPORTANT additions are being continually made in Woodward's Gardens. The grotto walled with aquaria is constantly receiving accessions of new fish and other marine life. The number of sea lions is increased, and there is a better chance to study their actions. The pavilion has new varieties of performances. The floral department is replete and the wild animals in good vigor. A day at Woodward' Gardens is a day well spent

Lost Papers.

If any subscriber fails to receive this paper promptly, after making due inquiries at the Postoffice, he is urgently requested to notify this office by *letter*, that we may send the missing papers, and, if possible, guard against further irregularities

The Wellington Coal Mine Disaster.

On Monday last a tremendous explosion occurred at the South Wellington Coal mines, British Columbia. Miners, women and children rushed to the mouth of shaft No. 3, whence the sound had emanated, and in a few minutes a party of rescuers descended. The volumes of smoke that rolled along the passages in the levels almost overcame those who had thus early commenced the search for any who might have escaped with their lives. The fumes of the gas also were nearly unbearable and prevented the rescuers staying below more than a few moments at a time. In the dark stalls the dim light of the Davy lamp revealed a heart-rending spectacle. There lay two brothers, blackened almost beyond recognition. Further on, in another stall, was found the body of a miner with the head reduced to a pulp. Several were alive when found and brought to the surface, where their injuries were attended to. The search was continued till midday, when the accumulation of after-damp became so great as to compel the work to be postponed. Seventeen bodies had been recovered. The men were just going down to work at the time, and had the explosion occurred a few minutes later the loss of life would have been nearly doubled. Thirty lives in all are reported to have been lost.

At 9 o'clock Monday night seventeen bodies of the victims had been recovered and laid out in a room at the top of the mine, besides six more whose bodies had not been brought up. Three miners are reported as missing. The mine was on fire in some parts and the accumulation of foul gas prevented further search being made.

The actual cause of the explosion was owing to the iguition of foul gas, which occasionally prevaded shaft No. 3, the scene of the disaster, and, in consequence of this known liability, it was the duty of the foreman to go down with a Davy safety lamp every morning, and report as to the condition of the various parts of the mine, registering such report in a book kept for the purpose. It is now said that he reported that morning that everything was safe, without having previously ascertained by going down into the mine. The first inquiry Mr. Dunsmuir made upon arriving upon the scene was for this man, but he was not to be found. Should he be discovered he will be arrested pending an inquiry, and the indignation against him is great amongst the miners.

Educational.

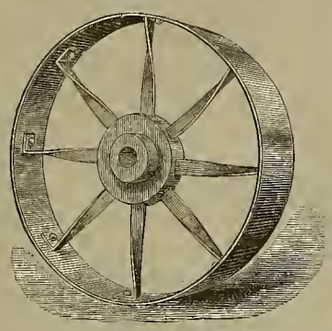
Iron and Machine Works.

MACBETH'S

—PATENT—

STEEL PULLEY.



Advantages of these Pulleys.

They are less than half the weight of cast-iron pulleys; are polished on the face; are made either crowned or straight, and are turned in the lathe the same as the best make of cast-iron pulleys.

They are carefully balanced. They are subject to no contraction strains, and can be run at very high speed without danger of bursting.

On account of their great lightness and the form of the arms, they absorb less power than any other pulley.

They are *the only pulley of the kind* which runs true. They cannot be broken in transport.

TESTIMONIAL:

MATHER LANE SPINNING CO. (Limited), LEIGH, ENGLAND, Nov. 5, 1883.

N. Macbeth, Esq. — Dear Sir: The Patent Steel Pulleys supplied throughout to our No. 2 Mill are working to our entire satisfaction.

They are very true, and are about 50 per cent lighter than the cast-iron pulleys in our No. 1 mill.

Yours faithfully,

For the Mather Lane Spinning Co. (Limited),

[Signed:] RICHARD T. MARSH, Managing Director.

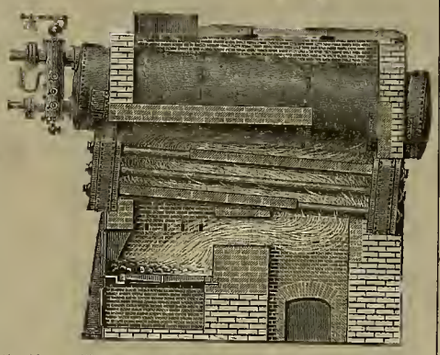
HEINE PATENT SAFETY BOILER,

RISDON IRON AND LOCOMOTIVE WORKS,

Sole Agents for the Pacific Coast, - Corner Beale and Howard Sts., San Francisco.



Economy in space and fuel. Safety at high pressures. Freedom from scaling. Equally adapted for power and heating purposes. Especially adapted for mills, factories, hotels, stores or any place where safety is a necessity. Will work well with muddy water and any kind of fuel.

TESTIMONIALS.

ST. LOUIS, MO., Sept 28, 1883

Messrs. Adolphus Meier & Co GENTLEMEN: We cheerfully certify that the "*Heine Patent Safety Boiler*" put up by you in our establishment has proved very satisfactory in its working. The chief points of excellence in the "Heine Safety Boiler" are its economy in fuel and space, freedom from scaling, aptitude for power and heating purposes, working equally well with clear and muddy water. We warmly recommend it to all using steam machinery. Yours truly,

ANHEUSER-BUSCH BREWING ASS'N.

OFFICE OF SUP'T OF ROYAL RAILWAYS, BERLIN, Sept. 23, 1883.

To Mr. H. Heine, Civil Engineer: In reply to your inquiry of September 20, we respectfully inform you that the three boilers built under your patents, under steam since September 25, 1881, at the Alexander Place Depot, as well as the two at Friedrich Strasse Depot, under steam since September 22, 1882, have given good satisfaction, requiring no repairs whatsoever to date. The internal cleaning of the boiler was always accomplished with ease on account of the convenient arrangement of the tube caps, the adhesion of scales being fully prevented thereby, and the boilers kept in prime condition.

(Signed): BRAUCKE.

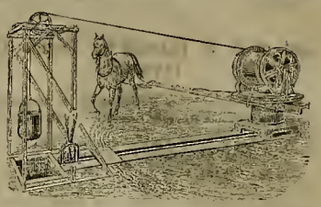
BAKER'S MINING HORSE POWER.



THE MOST EFFICIENT AND PRACTICAL MACHINE ever invented for the service of Prospectors and others requiring the use of a Horse Power; possessing all the requirements of a first-class hoist and affording means for the continuous operation of a Pump or Blower without interfering with a hoisting apparatus.

It is made entirely of Iron; no piece weighs over 250 pounds. At the ordinary speed of a horse a 1,000-pound bucket of ore may be raised 120 feet per minute. The hoisting drum is under the complete control of the man at the shaft, and is capable of carrying 500 feet of five-eighths steel rope. The cost of erection is slight, as two men in half a day can easily put it in place ready for work.

While this power is more particularly for mining purposes, it is equally adapted to all other uses where animal power is required, ☞ SEND FOR CIRCULAR. Address

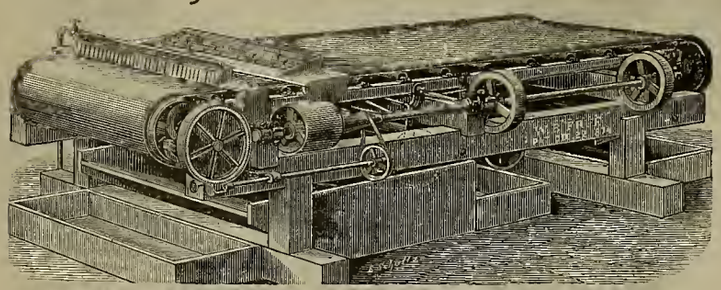
$1,000 CHALLENGE!



THE FRUE ORE CONCENTRATOR,
OR VANNING MACHINE.

PRICE REDUCED,

Jan. 1, 1884, to FIVE HUNDRED and SEVENTY-FIVE DOLLARS ($575.00).

OVER 800 ARE NOW IN USE. Saves from 40 to 100 per cent. more than any other Concentrator; concentrations are clean from the first working. The wear and tear are merely nominal.

A machine can be seen in working order and ready to make tests at the office of Hinckley, Spiers & Hayes, No. 220 Fremont Street, San Francisco.

To those Intending to Manufacture or Purchase the So-called "Triumph" Concentrator, we Herewith State:

That legal advice has been given that *all shaking motion* applied to an *endless traveling* bolt used for concentration of ores is an infringement on patents held and owned by the Frue Vanning Machine Company.

That suit has been commenced in New York against an end-shake machine similar to the Triumph, and that as soon as decision is reached in the courts there, proceedings will be taken against all Western infringements.

That we are and have been ready, at any time, to make a competitive trial against the Triumph, or any other machine, for stakes of $1,000.

ADAMS & CARTER, Agents Frue Vanning Machine Co.,

Scientific Press **Patent Agency.**

[ESTABLISHED 1860.]

Inventors on the Pacific Coast will find it greatly to their advantage to consult this old experienced, first-class Agency. We have able and trustworthy Associates and Agents in Washington and the capital cities of the principal nations of the world. In connection with our editorial, scientific and Patent Law Library, and record of original cases in our office, we have other advantages far beyond those which can be offered home inventors by other agencies. The information accumulated through long and careful practice before the Office, and the frequent examination of Patents already granted, for the purpose of determining the patentability of inventions brought before us, enables us often to give advice which will save inventors the expense of applying for Patents upon inventions which are not new. Circulars of advice sent free on receipt of postage. Address DEWEY & CO., Patent Agents, 252 Market St., S. F.

VOLUME XLIX Number 2.

New Form of Steel Drill Bar.

On this page are engravings representing Hammond's steel drill bar, which possesses several advantages over those forms commonly in use. In forging drill bits out of octagon steel, now in general use, it is necessary to manipulate from three to six inches of the bar, (according to its size and the diameter of the holes required), and to re-heat the same in the hearth an equal number of times before it can be drawn down to the cross-section (as shown at Fig. 2), which process occupies both considerable time and labor. With the improved bars, on account of their rolled construction, this result is obtained in the first operation, inasmuch as it is only once necessary to heat from one-half to one and one-half inches of their ends (according to size of bar), when, by the aid of the dolly or swedge, shown at Fig. 3, the X bit can be almost instantly formed. The saving in time and labor is computed by practical skilled experience as ten to one.

It is well known to all parties conversant in the manufacture and uses of drill and tool steel that each and every re-heat or contact with fire has a tendency to destroy its chemical cohesiveness, and to absorb, more or less, some of the deleterious gases and properties contained in fuel used for smiths' hearths, in consequence of which the quality of life or the steel becomes deteriorated, and no amount of skill in the operator, by tempering, can regain its full pristine strength. This effect in the Bonanza bars is reduced to a minimum, owing to the short length of bar to be heated, and even this can be *totally* obviated by the smith or workman burying a foot of 2 to 3-inch wrought iron tube in the fire, and inserting therein the end of the bar to be operated upon, as the tube will protect it from the sulphurous, phosphorous, and other obnoxious elements to be found in the fuel.

Further, it will be seen that the edges or corners of these bars can more readily remove when rotating any debris that may fall between them and the sides of the holes being drilled, whilst the four continuous semi-circular grooves serve as an outlet to the same, thus preventing the bar from becoming clogged, and consequently allowing the drill to work more uniformly.

In drilling in a direct vertical position it will be found that this section of bars, when rotating, acts as a spiral screw, and deposits the debris in larger quantities on the surface of the ground than can be done by those of other configuration.

The great desideratum, and a consequent saving of expense in weight, is obtained by using smaller sized bars of the patented form than would be required of other well known sections to drill holes of the same diameter. For example, with the one-inch bar the inventor says he can drill a hole 1⅜ inch diameter without any upsetting, which is demonstrated by drawing a line through the two diagonally opposing edges or corners.

These drills are made from the finest quality of crucible steel used for that purpose, and its many described advantages are such as to specially recommend it to the attention of all concerned in mining and quarrying operations.

Fig. 1 represents the rolled form and section. Fig. 2, the same with the X bit ready for use. Fig. 3, the dolly or swedge used in upsetting the X bit.

The following advantages, amongst others, are claimed for this improved bonanza steel drill bar, viz: That the smith is saved much time and labor in producing the requisite X shaped bit. That any miner, prospector or unskilled workman (where skilled labor is scarce) can upset his own drill bar, with a dolly or swedge, as shown. That the original quality of the steel, owing to no reheating being requisite, is more fully retained, and has a longer lasting capacity. That it more readily frees itself from the debris, and thus prevents clogging, consequently works with more uniformity, and with less strain to the drill. That it combines strength, with economy in weight, requiring smaller sized bonanza bars to drill holes of equal diameter, than can be accomplished by bars of other sections, of the same dimensions, and same amount of upsetting. Mr. Hy. Woodcroft Hammond, the inventor of this bar, has an office at room 18, 309 Montgomery street, in this city.

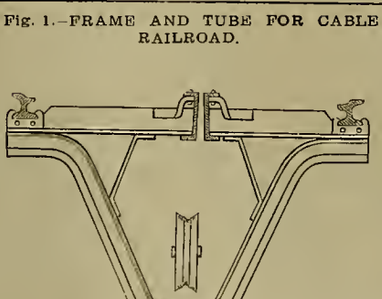

Fig. 2.—FRAME AND TUBE OF CALIFORNIA STREET ROAD.

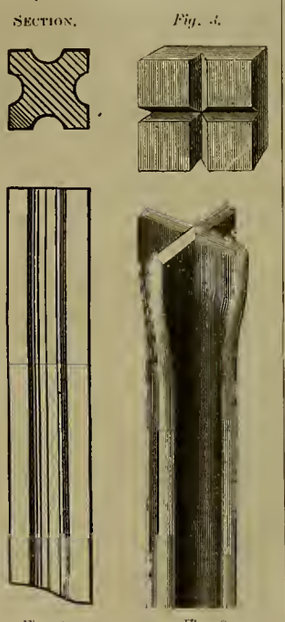

Fig. 1. Fig. 2.

HAMMOND'S BONANZA STEEL DRILL BAR.

Foundry Notes.

Business at the local foundries has been dull for some time past, and the slack time still continues. There is comparatively little mining machinery being made just now, that is in large orders, though of course there is more or less repair work, miscellaneous work etc., on hand.

The Risdon Iron Works have a large contract on hand for the Spring Valley Water Company, building some 27 miles of iron pipe for bringing water to the city. Most of this is 24 inch but some of it is 40. The pipe is made of the best quality of iron. A large two story building reaching from street to street has been erected to carry on this work conveniently, and special tools have been constructed for cutting, punching, riveting and handling the pipe. A large number of men are employed. After the pipe is made it is dipped in a coal tar mixture.

The San Francisco Tool Company are engaged in making some special large machinery for the new plant of the Union Iron works. They are also making machine tools for stock, and a number of centrifugal pumps for irrigating purposes.

The Dow Steam Pump Co., are making a number of their special pumps for local orders.

The Pacific Iron and Nail Works have been shut down for a week for overhauling and repair. New offices have been obtained in the city.

The Union Iron Works have been busy for weeks past moving their tools and machinery to their new quarters on the Portrero. The bulk of the material has been moved, though there is still considerable to be taken over. They have made a contract to build an iron steamer—the first one constructed on this coast—with all her machinery.

The Judson Manufacturing Company have been putting up new buildings and adding to their facilities.

At the iron mine of the California Iron and Steel Co., Hotaling, they have been refitting and improving the works. The company has just completed the erection of six new patent coal kilns, with a capacity of 50 cords of wood or 2,000 bushels of coal per kiln within a short distance from the furnace. They have contracted with all the timber owners within a radius of two or three miles for their wood, which will all be turned to coal in these kilns. Under the supervision of Mr. Secly they have re-lined the furnace with fire-brick procured in Pennsylvania at great expense, and equipped it with all the latest blast-furnace machinery and appliances; have remodelled and enlarged the hot-blast, and, it is rumored, will soon receive from the East a large and improved blowing engine. They have about 4,000 tons of ore on hand, and are hoisting more, night and day, at No. 1 shaft. About the middle of last January the company commenced sinking a shaft near the works. It is a two-compartment shaft, and it is the intention to run two safety cages therein. They use two compressed air drilling machines in sinking. It is thought the main ledge will be tapped at a depth of 300 feet. This will then become the main shaft and supply the furnace with ore. Millwrights are now ground framing timbers for large hoisting works soon to be erected over the new shaft.

Cable Railroad Frames and Tubes.

When the Clay Street Hill Cable railroad was first built, wood was used to a large extent. Cast-iron frames were made to conform to the desired cross section of the tube and placed about three feet apart, they having ribs cast on them so that planks two inches thick could be laid from one to another and held in position by the ribs thus forming a tube of wood, with supporting ribs of cast iron.

Ties extend laterally from these cast-iron ribs, upon the outer ends of which are placed stringers which carry the rails. The castings are open at the top, so that the vertical part of the grip may pass through, and close on each side of this opening, extending from one casting to another, are short car-lines, which are bolted at each end to the casting, thus keeping them at the proper distance apart and maintaining them in proper position. On top of these, and extending over several of the castings, are laid wood scantlings, which form the slot, and to protect the top from wear are placed iron straps fastened to the scantlings by wood screws. The surface of the roadway between the slots and the rails on each side is formed of wood plank.

At the last meeting of the Technical Society of the Pacific Coast, Mr. W. W. Hanscom, Mechanical Engineer, read a paper on Cable Railway Propulsion, in which, among other things, he described the construction of the frames. In speaking of the Clay street road, he says:

"As this road was extended after having been in operation about five years, some changes were made in the construction of the tube and in the cast-iron frame (Fig. 1) which was extended laterally, so that it now comes under and supports the rails, and has its base extending the same distance, the web being perforated in the centre to the shape of the tube, and also openings between the central, and each side, ribs or flanges being formed all around the openings and the outside of the frame. The tube in the extension is formed of concrete, and as it passes through the openings of the frame it forms a monolithic structure the length of the road to which this mode of construction is applied. The slot is formed by channel irons six inches deep, with two-inch angles top and bottom bolted to the casting, and wood carlines are placed from frame to frame only to support the wood plank which forms the street surface between the rails.

The tube on the California street road (Fig. 2) is constructed of a frame of wrought-iron, reaching out and supporting the rails, which was copied in the later construction of portions of the Sutter street road above alluded to. In the case of the California street road, however, the main element of the wrought-iron works was made of old rails.

WORK has been suspended at the Washington Navy Yard, owing to the failure of Congress to make an appropriation for its continuance.

CORRESPONDENCE.

We commit, unendorsed, opinions of correspondents.—EDS.

An El Dorado County Iron Mine.

[Written for the PRESS by C. B. T.]

The time has arrived when those in this State who are interested in mining are beginning to devote their energies to something beside the search for gold and silver. There is no question but that California is possessed of enormous mineral wealth, and that the day is not far distant when iron will be one of her leading resources. It has been known that this mineral was to be found, but the mining of it has been neglected. A very old English work in the writer's possession concludes an account of California in these words: "And it is thought that there are mines to be found in several places if they were sought for." This sentence, published in 1748, was prophetic. That iron exists in this State is an established fact. The developing of the mine near Clipper Gap has turned attention to the neglected industry. It is reasonable to suppose, and assays demonstrate the fact, that there is equally as good, if not better, iron ore elsewhere than at the mine just mentioned.

Many will remember the excitement that existed about twenty years ago regarding copper. That resource has lain undeveloped. This is principally due, in all probability, to the fact that the working of the ore required more skill and experience than was at hand, and also to the added fact that the mines were not easy of access for shipping. Large sums were spent at Copperopolis, but for years the works have been idle.

Everything points to a brighter future for the iron mining industry. There is an enormous demand for iron here. The railroads which are built consume a large quantity. As the country settles up, and as the foothills throughout the entire length of the State are transformed into the orchards and vineyards for which they are so well adapted; as little homesteads become more plenty along the hill slopes, there will be required a large number of small railroads to carry away the produce. The expense of rails has always been a great hindrance to railroad building in California. The production and manufacture of those rails here will greatly obviate this and will make possible the building of many short roads. As these penetrate the hills and as the whistle of the locomotive echoes up the ravines more houses will be built and more orchards and vineyards set out, because people will then have the assurance that their fruit can be transported to market. The relations existing between a railroad building in a country and the setting up and developing of its resources are reciprocal. What helps the one benefits the other; a retarding of one keeps back the progress of the other.

But there is another side to the iron industry. Besides the men engaged in its mining it gives employment to many more. The manufactories of a country are the salvation of its laboring inhabitants. There they find their proper spheres in the doing of that for which they are adapted. A man in a factory must understand his work, and the greater his knowledge, so much the more he receives for his labor. He may be a hewer of wood, or a drawer of water if he likes or he may be a mechanic laboring on a higher plane, actuated by ambition, endowed with capacity and achieving success.

California is gradually becoming a manufacturing State. There is no reason why she should not be celebrated as such. We have the raw material and we will have the markets for our factory products when we have such to ship. There is no country which will be able to offer to the factory hands more inducements whenever we have the manufactories. It has been frequently mentioned by various writers that the expenses of living here are much less than elsewhere, when it is considered that the general mildness and evenness of the climate in different parts of the State reduce the expenses for fuel and clothing to a minimum, the cause is partly found. The necessaries of life can be produced here equally as cheaply, if not for less than in most places. Therefore, possessing these advantages, that the factory hand will be able to labor comfortably and to live cheaply, there can be no doubt but what there will be an ample immigration of such as soon as there is work for them. The possession of the material to be worked in the factories will cause such to be built with laborers and with factories to demand and consume the raw material, increased attention will be turned to many industries that have heretofore lain dormant, and among all these that of iron mining promises to be one of the first to come into prominence.

Having seen several fine specimens of iron ore from a mine that is being opened in El Dorado county, between the Middle and South forks of the American river, and about eight miles from the town of Folsom, the writer gladly availed himself of the opportunity, while attending to other business to visit the interesting locality. Leaving Roseville, which is in Placer county, just where the hills are losing themselves in the plains, in company with Mr. J. L. Bulens, of that place, we rode to the mine, by way of Folsom and Mormon island.

About three miles east of Roseville, we reach a section, a great part of which has been mined over. These were surface diggings and were worked by Chinamen. The income was about a dollar and a half a day to the man. John came here to slake his thirst for gold in this humble manner because the places which paid better were appropriated by the whites. We pass the mouth of a little ravine which has been mined for miles, here the return was quite good.

The shaft on the iron mine is down about 30 feet, and discloses a vein of iron ore about three feet wide. This ore was assayed by Prof. Boynton of the Normal school in Bridgewater, Mass., and the result was, for the first assay 85 per cent iron, for the second 84.4 per cent. Several other assays have been made, the average of all being 75. Recently three hundred pounds of the ore were worked at the new steel works at Martinez, and a small rail was the result. The converting of the ore into steel rail can be done, it is stated, at a cost of two cents per pound. If this is the case there seems no reason why we cannot produce our own steel rails and develop the factories referred to at the beginning of this article. Everything indicates that the entire mountain contains iron. Pieces of the surface rock taken some 300 feet up hill from the shaft show plainly the indications of the metal. The surveyors found, when laying out the lines, that their compasses would not work. Messrs. Bulens and J. D. Pratt, who are heavy owners in the mine, are very sanguine and everything seems to indicate that they have no cause to be otherwise. One thing in favor of the location, aside from the abundance and high grade of the ore, is that the mountain can be tunneled from several points, and that thus the ledge or ledges—for there appear to be many—can be tapped from 300 to 500 feet from the surface. Thus the expense of hoisting the ore will be avoided. The mouths of the tunnels would be in a little valley, and the road from there to Folsom, which would be the shipping point, would be a good one over which to haul. Indeed, a railroad might be easily built, and the ore loaded into cars at the mouth of the tunnels. The heaviest expense in such an undertaking would be a bridge across the South Fork, but in consideration of the advantages to be derived therefrom, this would probably not long stand in the way of such an improvement. We understand that San Francisco parties are looking into the matter, and it is quite probable that this will be one of the leading iron mines of the State. It is certainly to be hoped that the enterprising discoverers will not rest until they have fully proven the extent of their find. We need iron mines, and when such apparently valuable ones are found, so easy of access and possessing so many great advantages, the best interests of the State demand that everything should be done to develop them.

Another Overland Railroad.

The California and Nevada Railroad has been started and is progressing towards completion in a very energetic but quiet way—so quiet that but few, even of our business people, are fully aware that such a road is really in process of construction. This road is already under contract to be built to Bodie, which town is situated almost directly upon the easterly line dividing California from Nevada, at which point it will be met by a road coming this way from the Denver and Rio Grande. The latter road is already constructed to Salina, a point about 210 miles due south from Salt Lake City. From that point to Bodie the distance is only about 600 miles, over a country very favorable for railroad construction.

The entire road will be of a uniform narrow gauge, corresponding to the Denver and Rio Grande, to the eastern terminus of the road. Starting from Oakland, the road runs northward to San Pablo, thence eastwardly and southerly over the Coast Range to Walnut creek. From that point a branch will probably be constructed directly to Stockton, while the main road will be continued southwardly and eastwardly across the San Joaquin valley to Modesto, thence to Sonora and over the Sierra by way of the well known Sonora pass. It will cross the summit at a point about 55 miles north of the Yosemite valley. At Bodie it also connects with the partially constructed Carson and Colorado Railroad, which will soon be completed along the eastern slope of the Sierras to a connection with the Southern Pacific, which runs from Mohave to the Colorado at the Needles. The California and Nevada Narrow Gauge will be in full and close connection with the extensive and rapidly growing narrow gauge railroad systems in Neveda, Utah and Colorado, and with its connecting roads will be the most direct and shortest railroad line between San Francisco and New York.

Its route through California passes through a superior portion of the State, without really paralleling any other road, thus developing for itself a new and rapidly-growing field of traffic through Alameda, Contra Costa, San Joaquin, Stanislaus, Tuolumne and Mono counties.

As already stated, the grading of the entire road is under contract, to be completed in four years from March last. Contracts for a large amount of rails have also been made; also rolling stock. The rails have already been laid six miles from the landing, and the first locomotive is now on its way to San Francisco. It is expected that cars will be running to Walnut creek by January 1, 1885. The track is already graded a distance of over twenty miles. The Oakland terminus will be at a point near the Judson Iron Works, and the landing in this city has been temporarily fixed at the Saucelito ferry slip. This road will probably form the trunk line to a complete system of narrow gauge railroad, which will probably be extended throughout all the important interior portions of the State. Its connections with the Rio Grande of Colorado, and the general narrow gauge system of Utah and Nevada, together with the unlimited amount of capital at the command of these roads will insure for this a fairly competing transcontinental road, which is one of California's greatest needs.

The Poetsch System of Mining in Quicksand.

Through the kindness of Mr. A. Bernay, representative in this country of Mr. F. H. Poetsch, the inventor of a novel method of driving and sinking through quicksands, repeatedly alluded to in the *Engineering and Mining Journal*, we are in a position to submit some additional details. Thus far, mining enterprises in this country have been comparatively little troubled with the necessity of overcoming difficulties due to works in quicksand. It has been reserved for railroad engineers engaged in tunnel work, and civil engineers in sewerage and foundation work, to gather sad experience in this character of ground. Still such emergencies are likly to and do arise at any moment, and Mr. Poetsch's simple and successful method does away with the uncertainty and no small share of the cost of such work. The method has attracted a good deal of attention abroad, and can boast of quite a literature, though only brought out a short time ago. The best, though not the most recent account, is that of Dr. Max Weitz, of Aschersleben, an associate of Mr. Poetsch in his work. From his paper printed in the *Zeitschrift fur das Berg-Hutten-und Salinen-Wesen*, and from other sources, we take the following:

The object of the new method is to convert the quicksand into a solid mass, or surround that part yet to be extracted in driving a tunnel or making a shaft with a solid wall of ice, impervious to water, thereby avoiding the use of pumping machinery and of heavy timbering. Poetsch converts the quicksand into a solid mass by circulating a very cold solution through a system of pipes driven into the treacherous ground. After making a series of preliminary experiments, which convinced him of the correctness of his idea, Mr. Poetsch undertook his first work at the Archibald lignite mine, near Schmeidlingen. The shaft, 15 by 10 feet, had been sunk to a depth of 107 feet through rock, but was separated from the bed of lignite by a 5.5 meter stratum of quicksand. By piling, an effort had been made to put it through, but the work had to be abandoned after the shaft had got 1.3 meters below water-level. In order to give the water relief, a hole had been drilled in the center of the shaft into a level in the coal below it, a circumstance that was not without its effect upon the execution of Mr. Poetsch's work.

Mr. Poetsch sank 23 pipes, ten of them along the walls of the shaft, through the quicksand and 15 feet into the liquid under it, the diameter of the pipes being 200 millimeters. At their lower ends, these pipes had an inner conical attachment against which a wooden plug was driven from above, thus closing the pipes below. After emptying the pipe with a sand-pump, the bottom was plugged with a layer of 6 centimeters of cement, 6 centimeters of gypsum, and 6 centimeters of loam. Into every pipe a second 30-millimeter pipe, open at the lower end, was introduced. The cold solution entered the latter pipe from above, and descending, flowed out of its lower end, flowing upward in the circular space formed between the mines and the outer pipe, a constant circulation being kept up through the ice-machine, which was of the Carre design. In this case, a chloride of calcium solution was employed, which freezes at 40 degrees Celsius below zero. Twenty 1.5 foot pipes were driven into the bottom and the walls of the shaft to measure the temperature. The daily record shows that, at the beginning of the work, on July 8th, 1883, the temperature of the air at the bottom of the shaft was 12 degrees C., and at the four walls 11 degrees C. On the 15th, the figures for the air and the four walls were, respectively—1.5, 6, 4.5, 5 and 7.5. On the 23d, they were—4 for the air, and 14, 17, 14, 13 degrees Celsius for the walls; and on the 31st of the month, 24 days after the beginning of the work, the record stood—6 degrees for the air, and 19, 17.5, 19 and 18 degrees Celsius for the four walls. The temperature was measured immediately when the bottom of the shaft was reached; after awhile, the radiation of heat by the observer carried it upward; and after a number of miners had been steadily at work for some time it ranged from 0.5 to 1 degree.

While the shaft was sinking, which was done within the freezing-pipes, the freezing process was continual. As the shaft was perfectly dry, and the ground had become as hard as sandstone, it was sunk by means of the pick, in sections of 3.29 feet, and was then timbered. On the 30th of September, the lignite was reached, and was found to be frozen for a depth of more than three ft. Its hanging-wall was so closely united with the foot-wall of the quicksand that pieces of both of them did not break on the plane of contact—an important point, showing, as it does, that it is immaterial, so far as the Poetsch system is concerned, whether the quicksand is in a horizontal bed or has a strong dip. After the shaft was sunk, holes were drilled into the ice-wall 1.7 feet above the coal, and measurement showed that at this point there was a column of ice 1.5 meters in diameter around every freezing-pipe. Other measurements showed that the thickness of the ice-wall increases with depth, a fact due probably to the circumstance that the cold solution issues from the inner pipe at its lower end.

The fact that in the Archibald shaft there was a connection with a shaft below had the following advantages: A part of the freezing-pipes, calculated for the whole thickness of the bed of quicksand, were thereby exposed to the air, cooling it instead of a corresponding thickness of ground. There was flowing water that gave rise to great loss by being unnecessarily chilled, and by causing the outer circumference of the ice wall to grow slowly. The same trouble interfered in a more serious manner with the sinking of a shaft at the Max colliery near Michalkowitz, Upper Silesia. Two adjoining shafts had been sunk to a certain depth by ordinary methods, but could not be got down further. They were crammed with timber. Poetsch undertook the contract of putting through one of them within a given time, but a series of break-downs and the crowded condition of the shaft delayed work. Meanwhile the projectors had gone on with the other shaft and succeeded in putting it through just when the work of freezing was beginning with the other. The pumping in the shaft so much interfered with the work that the period for the completion of the shaft passed and the owners ordered work stopped.

The third piece of work was done for Dr. Werner Siemens, at the Centrum mine at Konigs-Wusterhausen, near Berlin. The shaft, 15 feet square was to be put through a 110-foot layer of quicksand. With sixteen freezing-pipes it took 33 days to complete the ice-wall, and in a comparatively short time the shaft had been excavated. A fourth work is now progressing at the Emilie mine, near Finsterwalda, where a 132 foot bed of quicksand is to be passed through with a 12 foot circular shaft, using 12 freezing-pipes.

Mr. Poetsch has proposed to run the system also for the foundations of bridge piers in river sand, modifying it to suit the circumstances of the case. In order to protect the masonry against the low temperature in the excavation protected by the ice-wall, he covers its outer surface nearest the latter with straw or slag-wool, or uses a mixture of tar, pitch, and sand, instead of cement, for outer courses, or finally employs a chloride of magnesium solution instead of water for mixing ordinary cement.

HISTORY OF BORING TOOLS.—A writer says: "The first boring tool may be assumed to be an awl of some kind. Pliny states that Dædalus invented the gimlet in 1240 B. C. It was destitute of a screw point, but it may have had a hollow pod and a cross-head forming a handle. Awls are shown in Egyptian tombs of 1706 and 1490 B. C. The screw point was added to the gimlet in course of time, and within our own recollection the twisted shank, which makes it self-discharging. The hint was taken from the auger proper, which may be called a magnified gimlet, now that their specific features have become so closely assimilated in form and function. The auger (*terebra*) was a Greek tool. From the early descriptions, the auger seems to have been considered a shipwright's tool. It formerly had a curved, sharpened end, and a concavity to hold the chips. This was a poor auger. To this a lip was subsequently added for some kinds of boring, and in course of time the depression grew into a spiral, which allows the chips to escape while the boring proceeds, instead of withdrawing the tool as the pod becomes filled. The twisted auger is the American invention, and was made by Lilley, of Manstield, Conn., about the beginning of the present century, and afterwards by Gurley, of the same place. Augers may be classified as augers, annular augers, taper augers, augers with secondary bores, reamers, or countersinks, or having expansive cutters."

OUR FOREIGN MARKETS.—Too little attention is paid by our manufacturers and producers, in regard to the kind and quality of goods, which are in demand abroad. A more careful study of our consular reports, would be of advantage to our exporters. These reports contain a large amount of valuable information, in the dissemination of which the government is doing a good work for the country, if the people will only accept, and make a proper use of the information so given. In this connection we would add the following, from a late Chicago paper: "With all our activity in production, *and our seeking for foreign markets, we buy much from, and sell little to the countries, lying south and nearest of all the world to us; and that little, moreover represents our least skilled industries. For instance, we sell provisions, lumber, petroleum, etc., and buy of them principally, coffee, hides and skins. At the same time these Southern countries, unskilled in manufactures, purchase all kinds of fine and coarse goods and household articles, almost entirely from Europe. We endeavor to put our products of skilled labor upon the countries which produce already the surplus which supplies our southern continent, Mexico and the West Indies, from a double distance, at what ought to be a greater cost of freight. We also, with the balance of trade greatly against us in those southern countries, furnish through that paid-up annual balance the money that pays for those purchases of European goods."

MECHANICAL PROGRESS.

Present Steam Engine Practice.

It is generally believed that the improvement in steam engine economy that has been made within the last fifteen or twenty years has been owing mainly to the introduction of high-speed practice that all or most of the increase of power for diameter and stroke of cylinder and piston, and most of the economy in fuel, are due to the increased piston speed. To some extent this is true; but it is also true that engines are built on better plans and under the guidance of better mechanical judgment than was formerly possible. Much of this improvement is to be attributed to the increasing use of the indicator, which not only points out the faults of the engine, but designates the reason and thereby suggests the remedy. The head of a large engine building establishment recently pointed out a discarded engine in the setting-up department which was in perfect order, and which eighteen years ago was a type of the best style of horizontal stationary engines then in use. When running it had a piston speed of 150 feet, and developed, by the indicator, about 100 H. P. Another engine of the same diameter of piston and same length of stroke, of the modern style, was running at a speed of 190 feet per minute, and yet was developing nearly 200 H. P. twice as much as the other. The reasons for this difference were several, that of 40 additional feet of piston speed per minute being only one. The modern engine had generous ports, both of ingress and ogress; the friction was, by careful balancing and exact workmanship, reduced to a minimum; all the trusts were exactly in line, with no canting leverage; and the journals, crank-pin, weight and length of connecting rod were all adapted one to the other and made for the work they were to do. Not a pound of superfluous metal, not a suggestion of a make-shift nor a faucy of a draughtsman could be found on the modern machine.

Another instance of the improvements that have been made in engine building and engine practice was noticed at the same establishment, where an engine of the modern type, 11 inches by 21 inches, was performing all the work that had been done until recently by an engine 18 inches by 36 inches that was built about seventeen years ago, and yet was not requiring two-thirds of the fuel used to furnish steam for the old-time engine running the same number of hours.—*Scientific American.*

A Talk About Belts.

Our natural tendency to deceive ourselves by preferring present convenience to future profit, says an exchange, is often too well illustrated in the selection and arrangement of belts. First cost should not determine the width and thickness of belts any more than it should determine their length. They should have width and thickness to do the work easily, without having to be strained so tight as to produce undue friction on the journals, and stretch the belts out of shape.

Having seen a small belt doing a great amount of work, we take that as the capacity of a belt of that size, under all circumstances, without noting the length of leverage it has over the load, or in other words, the great speed of the belt in proportion to the slow movement of the load; nor do we ask even of our own judgment how long a time such a small belt will carry such a heavy load without stretching into such crooks and curves as to destroy its future usefulness.

Double leather belts do not stretch into crooks and curves as soon as single belts do, because the soft, sponge-like places in each belt of the double one are frequently supported by the firmer part of its mate; also, double belts are not so often overloaded, and they get better care and attention.

A single belt will stretch crooked whenever a part of its width is softer than the remaining part, unless the load be adapted to the weaker part, just as the load of a chain must not exceed the strength of its weakest link.

In former times, when everybody made their own belts, men sometimes prided themselves on cutting up a side of leather so that the whole width of the belt would be of uniform texture, but their pride would often get a fall The worst belts that I have ever seen were home made. There are soft spots in the hide and in the leather, and they will be in the belt, sometimes across the entire width, but oftener only a part of the width. This makes unequal expansion, and unequal expansion will crook an iron plate. The manufactured article may possess uniformity, and it is better than the old style of home made belting, but good judgment would dictate ample width and high speed in proportion to the movement of the load for single belts.

Let any man look about him in mill or shop and he will see that it is not the heavy belts that men put up, with a full knowledge of what they had to do, that make the most trouble, but it is the single belts, such as men put up without much thinking about them.

BEARING METALS.—In the selection and final indorsement of a metal for journal bearings, says the *Journal of Railway Appliances*, a great many points should be considered that are too often disregarded. Durability, coolness in running, economy of oil, cheapness in first cost, etc., are all desiderata; but "one swallow does not make a summer," nor does one of these good points, though possessed in a startling degree, necessarily make a bearing metal superior to others. There are metals very popular on account of their great wearing qualities, which fairly eat oil, requiring a continual small deluge of lubricants, and often the adventitious aid of cooling compounds to prevent them from usurping the province of the car-heater. Others run cool enough, but are chewed up by the journal like an Ashantee in the mouth of a man-eater. The first cost of others would suggest the propriety of substituting cold, while others are useful only in demonstrating to what base use good type metal may be put. A bearing metal or alloy that will be economical of itself and lubricants, strong enough to resist the wear and tear of running, yet not so hard as to cut or file, that will not heat nor "crowd" (as some lined boxes are said to do), but which runs well and economically under all ordinary conditions, is something that has been most industriously sought for, but not yet found.

Iron Shutters a Failure.

Exactly what benefit iron shutters are, except to the party who makes them, is a question on which there are less doubts now than formerly. Public opinion is beginning to regard them as very useless, if not very dangerous, in most cases. They are among the worst obstacles firemen have to encounter when striving to enter a burning building. They prevent his ingress while they aid materially in protecting, and consequently developing, the fire till it has acquired a most dangerous violence. It is now regarded by the firemen as almost certain that where a fire has originated inside a building, sealed with iron shutters, it will destroy the building. In a recent instance, in New York, if the firemen had been able to throw water through the upper windows of that building when they first got to work they could have drowned the flames, but the iron shutters stood in their way, and they were compelled to follow the fire from the first floor until it reached the fourth, where it acquired such fury that the tons of water poured on it had for a long time very little effect. The idea that iron shutters keep fire out is a fallacy. Flames on the outside will heat them red hot, and they cannot be made so tight that tiny sparks may not pass them. Merchandise of the value of $2,000,000 were destroyed three years ago in a Brooklyn storage ware-house by a fire started by sparks from a fire-engine that was at work in front of the building, the sparks having passed through crevices at the hinges of a shutter.

STEEL nails have been made in this country in limited quantity for some time, but they have been held at figures so much above the price of iron nails that the trade developed but slowly. Now, however, they can be had at more reasonable figures, some companies selling at about the same price as iron nails, and their growth in popularity is rapid. The principal companies now making steel nails are the Riverside Iron Works, of West Virginia; the Bellaire Nail Works, of Ohio; Shoenberger & Co., of Pittsburg, and the Albany and Rensselaer Iron and Steel Company, of Troy, N. Y. The Tremont Nail Company and the Robinson Iron Company, of Massachusetts, also manufacture steel nails to some extent. The Benwood Iron Works, of West Virginia, will soon be added to this list, as its Bessemer steel plant is approaching completion. Other companies are making arrangements to manufacture steel nails, and some have done so experimentally, but if the demand assumes large proportions it is very likely that more active preparations will be made to meet it. The best steel nails now in the market present a very handsome appearance, being perfect in shape, with sharp edges, and not a flaw or seam visible, which is too often the case with iron nails. Some of the samples have been bent cold into a complete coil, demonstrating the toughness of the metal and its freedom from lamination.

A NEW HEAT MEASURER.—A paper on a new form of pyrometer, by T. Carnelly and T. Burton, was recently read before the Chemical Society. The pyromcter, which the authors have used since 1881, consists essentially of a copper coil that is placed in the muffle, kiln, etc., whose temperature is to be determined. Through this coil flows a constant current of water. The temperature of the water is taken as it enters the coil and as it flows out. From the difference of these two temperatures and a table, the temperature to which the coil has been exposed can be ascertained. By means of the above instrument, temperatures up to 650 degrees C. have been determined to within 25 degrees.

THE GILBERS SOAKING PIT PROCESS is now in continuous operation in four Bessemer works in England, two of which roll off directly without any furnacing whatever; and it is to be started at the largest open-hearth steel works in Scotland. On the continent two Bessemer works are using the soaking pit, a third one is just starting, and one open-hearth plant is also employing it.

SCIENTIFIC PROGRESS.

A New Telephone Transmitter.

Conversation Carried On a Distance of Twelve Hundred Miles.

The telephone has become such a necessary part of the business machinery of the world that any improvements tending to its more perfect operation are watched in their developments with interest. One of the great faults with telephones has been the induction between wires on different circuits near each other, by which persons talking over different lines could hear each other.

A few days since, according to the *Cincinnati Enquirer*, a test of a new transmitter was made over the wires of the Baltimore and Ohio Telegraph Company. An instrument was placed in the operating-room, and one in the cellar. These instruments were connected by a wire forming a circuit from the instrument in the operating room to Chillicothe and back to the instrument in the cellar. This made a distance of almost 200 miles. Over this length of line, the voice of a person talking could be heard very distinctly, even when spoken in so low a tone that another person standing a few feet from the person talking could not hear what was said. A line was next formed to Grafton, Va., 600 miles, and then to Baltimore, Md., a distance of 1,200 miles, and there was no perceptible change in the distinctness with which the voice could be heard or the words understood. It was a very severe test, yet it was demonstrated that with this transmitter, persons, hundreds of miles apart, can carry on conversations intelligibly. While the test was being made, the thirteen or fourteen telegraph wires were in operation, yet there was no apparent induction: the instruments could not be heard, as they can frequently be in this city, where the telephone and telegraph wires are near each other. This difficulty, it is claimed, is overcome by the formation of the carbons of the transmitter, so that there is air constantly between them, and when they vibrate while speaking into them the current is opened and closed perfectly, as with a telegraph instrument

Flame and Oxidation.

In the course of one of a series of lectures on "Flame and Oxidation" at the Royal Institution, Professor Dewar recently exhibited a machine for the manufacture of ozone on a large scale, constructed by Dr. Wise for use in a health resort under his charge in the Engadine. It had thirty-eight tinfoil plates, and the machine to drive the air through was a small turbine, there being plenty of water to drive turbines in Switzerland. By experiment he proved that platinum black would liberate iodine from iodide of starch, and that it did so by means of the air it carried down into the solution, because platinum black, freed from air by being taken from beneath water in which it had been boiled, had not the same effect. He next showed that the mere presence of platinum black and air would oxidize alcohol into acetic acid, and became greatly heated in the process. In another experiment he showed that the shaking up of granulated zinc with water in a partly filled large bottle would cause the formation of a small amount of peroxide of hydrogen; he further stated that a solution of peroxide of hydrogen in water, although perfectly colorless and transparent, has the power of cutting off the ultra violet rays of the spectrum.

Carbonic acid, he said, is the highest oxide of carbon, and the substances adhere to each other with such tenacity, that even the intense heat of burning magnesium can do but little in the way of separating the oxygen from the carbon, for when burning magnesium is plunged into carbonic acid gas it burns fitfully for a short time, and then goes out. Notwithstanding this strong affinity, the leaves of trees separate the carbon from carbonic acid under the influence of sunshine, but how they do so is not known; the oxygen thus separated does not appear to be oxonized. The red rays of the spectrum are most active in effecting the decomposition in the leaf, and the action of sunlight is clearly one of deoxidation. The carbon is not deposited in its pure state, otherwise it could not move about in the plant; it seems to be produced first in the form of sugar, which is afterward transformed into starch; or it may be that starch is formed first and sugar afterward. As starch can not move about in the plant, the inference is that sugar is formed first. In another experiment he showed that permanganate of potash—Condy's fluid—is deoxidized by the addition of peroxide of hydrogen, although both substances have strong oxidizing powers.—*Scientific American.*

A Curious Telephone Experiment.

Another very curious telephone experiment is reported as having been made at the April *seance* of the "Societe Francaise de Physique," at Paris. The experiment consisted of the use of a gloved hand as a telephone receiver. The apparatus used was a battery and a microphone transmitter in the main circuit, an induction coil with the break circuit closed, and two ordinary holders, such as are used when receiving a shock from a battery. When two people, each with one hand gloved, take hold of the two holders with their bare hands, and one of them holds his gloved hand over the ear of the other, any conversation or music near the microphone becomes audible to this other; or, if they hold one another's ears, both may hear. By leaning their heads together, so that their ears would touch except for a sheet of paper placed between them, the same result was obtained. It was also found possible to do away with the stretched membrane, the glove or paper, and for a third person to hear the conversation in the bare hands of the two holding the electrodes, when these two held their ears together. It has even been possible to render the sounds audible to a chain of people, each holding the ear of his neighbor.

The telegraph reports of July first report something still further new in this direction, which is given as follows: The new telegraph line which has just been opened between Boston and Providence introduces a new idea into the general telegraph business of the country. In the well known quadruplex system four messages may be sent at once over one wire, two in each direction. By the new system seventy-two messages may be sent at once over the same wire, all in one direction, or part one way and the rest the other.

The Late Earthquake in England.

The district where the shock of the recent earthquake was most severely felt in England, was confined to only one geological formation—namely, the middle Eocene, and to only one portion of that. This formation occurs in two districts. It reaches from London, in a triangular form, to the sea, from Shoeburyness to Aldborough, and it occurs again in Hampshire and the Isle of Wight. Essex and South Suffolk, which are the two counties where the shock was most felt, are one basin and bed of Loudon clay, which attains its maximum depth of about 500 feet in South Essex, near Southend. It is dangerous to theorize, but it may, we think, not unreasonably be suggested that the shock was not felt in Kent or in the adjacent districts, because the firmness of the chalk, extending to a great depth, resisted the subterraneous forces, whereas the London clay, which is a soft, gelatinous formation, was shaken from below through its whole thickness. To illustrate our meaning by a familiar illustration, the jelly on a supper-table will shake from a passing team when more solid viands remain unmoved. Any one who will turn to "Hull's Physical History of the British Isles," p. 3, and the map referred to, will find that Colchester, Ipswich, Malden, Southend, Shoeburyness, Bury St. Edmunds and all the town named in the dispatch are to be found on this one formation.

The number of shocks in an earthquake varies indefinitely, as does the length of intervals between them. Sometimes the whole earthquake only lasts a few seconds. Thus, the city of Caracas was destroyed in about half a minute, 10,000 lives being lost in that time. Lisbon was overthrown in five or six minutes; but a succession of shocks may continue for hours, days, weeks and months. The Calabrian earthquake, which began in February, 1783, lasted through a continued series of shocks for nearly four years, until the end of 1786. The area shaken by an earthquake varies with the intensity of the shock from a mere local tract, where a slight trembling has been experienced, up to such catastrophes as that of Lisbon, which convulsed not only the Portuguese coasts, but extended into Iceland on the one hand and into Africa on the other, agitated lakes, rivers and springs in Great Britain, and caused Loch Lomond to rise and to subside with startling suddenness.

UNDERGROUND TELEGRAPH WIRES.—The bulletin of the French Telephonic Society calls attention to a complete interruption on most of the telgraphic lines for 48 hours, caused by a violent tempest. The subterranean wires which united Paris with the principal cities of Northern and Eastern France worked, however, without interruption, so as not only to satisfy all their normal traffic, but also to supply much of the deficiency arising from the failure of the other lines. Had it not been for the underground wires, Paris would have been entirely cut off from all telegraphic communication with other points.—*Les Mondes.*

A LEGACY FOR AERIAL NAVIGATION EXPERIMENTS.—Charles F. Ritchel, of Bridgeport Conn., who tried to invent a flying machine, will get $100,000 to perfect the invention with from the estate of Maxwell, a millionaire brewer at Milwaukee, who left $500,000 for experiments in aerial navigation, one-fifth of it being specified as for Ritchel's machine. Ritchel will begin experiments on a large scale.

THE SUN'S ATMOSPHERE.—Ordinarily, what we see of the sun is the photosphere. But outside of that and beyond it the sun has an envelop of gas and streamers 200,000 miles in extent, and sometimes a 1,000,000 miles, and even 5,000,000 or 6,000,000 miles are thrown out. This invisible part becomes visible at times of eclipse.

Passing Events.

The weather during the past week has been unusually warm for these latitudes, and San Franciscans are already sighing for their customary cool ocean breezes, which they usually profess to dislike.

The rumors of approach of cholera from abroad prove to be wrong; but extra precautions are being taken in New York and other Atlantic ports to prevent its getting a foothold in this country.

There is little news of special interest from the mining regions which we have not summarized in other columns. Prospectors are roaming the hills everywhere, and miners are all busy at work. They have had a strike at Bristol, Nev., among the furnace men. They wanted an increase of pay, which was refused. The men knocked off. Then, there being no furnace men to work the ore, the Mendha mine, Highland and Day mines, Royal City, had to stop and discharge their men and teams. The furnace hands received: Smelters, $4 per day; feeders, $3 50; and outside men, $3.

Business in the city is quite dull just at present. The interest of the country is just now centered in political matters, and this interest will probably increase until the November elections.

THE Morning Star Mining Company at Leadville paid a dividend of 25 cents per share or $25,000, on the 1st of July. This is the first dividend since November, 1883. In all the company has paid twenty dividends, amounting to $740,000.

Assessment Work and Relocations.

Some time since a man in Placer county, in this State, make an application for a patent for a mining claim, but before the patent was issued he died. Other parties then relocated the claim, and tried to keep it, but the man's heirs interfered, and the matter was brought before the Commissioner of the Land Office, and then appealed to the Secretary of the Interior. The men who had relocated protested against the patent being issued to the heirs, claiming they had a right to relocate the ground any time prior to issuance of the patent, because the annual labor to make requisite improvements on the mine had not been made by the man who applied for the patent or by his heirs.

This was only part of the controversy, but it is an important point, and one which miners will do well to bear in mind. The sole question, on this part of the subject, which the Secretary of the Interior was called upon to decide, was "whether such claim is subject to relocation by strangers, in the interim of entry and issuance of patent, even though the entryman may have failed to perform the annual labor or improvements required by Section 2324 of the Revised Statutes."

Section 2324, Revised Statutes, has reference solely to title by right of possession, and does not in any way conflict with titles acquired by purchase; for in the latter case both must be in one and the same person. The mining laws require certain acts, in the nature of conditions precedent, to be performed before an entry is made, and the validity of the entry is made to depend upon the facts existing at the time it is made, and not upon anything which the claimant may do, or omit to do, afterwards. * * *

"The true rule of the law governing entries of the public lands, to which mineral lands form no exception, is that when the contract of purchase is completed by the payment of the purchase money and the issuance of the patent certificate by the authorized agent of the government, the purchaser at once acquires a vested interest in the land, of which he cannot be subsequently deprived, if he has complied with the requirements of the law prior to entry; and the land thereupon ceases to be a part of the public domain, and is no longer subject to the operation of the laws governing the disposition of the public lands. In such cases there is a part performance of a contract of sale which entitles the purchaser to a specific performance of the whole contract without further action on his part. When the proofs are made, and the purchase money paid, the equitable title of the purchaser is complete, and the patent when issued is evidence of the regularity of the previous acts, and relates to the date of entry, to the exclusion of all intervening claims.

"In short, an entry made is, in all respects, equivalent to a patent issued, in so far as third parties are concerned.

"As the doctrine is firmly established, that where several concurrent acts are necessary to make conveyance, the original act shall be preferred, and all subsequent acts shall have relation to it, it is held that an entry made is equivalent to a patent issued, within the meaning and intent of section 2324 of the Revised Statutes."

"The right to a patent once vested is treated by the government, when dealing with the public lands, as *equivalent* to a *patent issued*. When, in fact, the patent does issue, it relates back to the inception of the right of the patentee, so far as it may be necessary to cut off intervening claimants."

Section 2324, R. S., contemplates that the prescribed amount of labor or improvements be performed and made annually upon each and every mining claim until patent shall be issued therefor; but it will be observed that such requirement is inapplicable to a case where the applicant has paid for and entered his claim, as has been done in the premises; inasmuch as the language of the section has reference merely to the right of possession—which is the very lowest grade of title known to the mining laws or any other law. The preliminary act of location is a basis for the vested possessory right, which is recognized by law, and of which the claimant cannot be dispossessed save upon the ground of absolute abandonment.

"Section 2324, the only statute affecting this question, must be construed in connection with Sec. 2325. Both have reference to the possessory title of an applicant for patent, and the mode of acquiring patent; the latter providing that, if no adverse claim is filed during the period of publication, it shall be assumed that none exists. It would, therefore, seem immaterial, after proceedings under Sec. 2325, whether or not the requirement of Sec. 2324 is complied with to the extent named in the first decision, because, if parties have not been properly notified, or have paid their share of the assessment work, they must still file their adverse claim under the proceedings contemplated in Sec. 2325. They waive their rights by failure to file such claim; and upon such failure, the law not only assumes that no such claim exists, but if the antecedent publication and attendant proceedings have been regular, all that might be set up by suit in court has been adjudicated in favor of the applicant."

"It was not a part of the public domain, being in the possession of the applicants for patent under at least a color of title. Whether they had complied with all the provisions of the law or not, there had been such a compliance that full and complete notice was given to protestants and all others, that the occupants thereof claimed to hold it under the laws provided for the acquirement of title to mineral lands. The law had fixed the time and method, by which parties disputing this claim might be heard, and they did not avail themselves of that provision."

The Drum Lummon Mine, Montana.

Through the courtesy of Geo. Attwood, Esq., General Manager of the Montana Co. (limited), of London, an English incorporation which recently purchased this mine, we are enabled to furnish our readers with a description of this valuable property, which bids fair to prove a bonanza second only to the celebrated mines of the Comstock.

The Drum Lummon is situated in Montana township, 21½ miles from Helena, its capital, and 13½ miles from the Northern Pacific Railroad at Bordsoy siding, at an elevation of 5,000 feet above the level of the sea. From its altitude and latitude the seasons are necessarily short, but with the advantage of water and timber in abundance and accessibility to rail, this disadvantage is but little felt. The mine was discovered and located by Thos. Cruz, an Irishman by birth, and sold to the present incumbent, he retaining a large stock interest in the property. Owing to decomposition of the gangue and its heavily mineralized contents, and the surrounding rocks being of a hard, crystalline character, the vein does not crop, but is largely covered by debris. Notwithstanding its extraordinary width, it is known as a blind ledge. The formation is a metamorphosed clay slate, or "*killas*," on the foot wall, with gray granite on the hanging. The gangue is quartz, its mineral contents a gray copper ore, or Fahlerz, containing an average of $35 per ton in gold and silver, in about the same proportions as the Comstock of Nevada, with a percentage of copper nickel and platinum. It varies in width from 52 to 150 feet, as proved by numerous crosscuts at various depths to a depth of 500 feet. A selection, however, if desired, from the mass, could be made of very much higher grade for a mill, as there are streaks that run as high as $700 per ton. But the Manager considers it more to the advantage of his company to work the mass as it is broken from the mine, without selection.

The vein courses on its line of strike north and south magnetic, and has been proved to carry ore for a distance of more than 2½ miles.

The mine is opened by an incline shaft, 12x8, which has attained a depth of 500 feet, with two main tunnels cross cutting the formation to and through the vein. The upper is 300 feet vertically from the surface, and is 400 feet in length.

The adit level is 1,200 feet in length. The vein is found at this point to be 52 feet in width, from which lateral drifts have been driven north 75 feet and south 54 feet, with stopes opened for the extraction of ore. The reserves are comparatively virgin and intact, as but very little ore has been extracted from this enormous mass. The mine will be timbered in the block or square set system.

A 30-stamp mill is now running at the mouth of the lower adit, by the dry process, crushing two tons to the stamp per day.

A new 50-stamp wet process mill is in process of construction. Its capacity will be from three to four tons to the stamp. When the latter is completed, the milling capacity will be over 200 tons per 24 hours. Steam is used as a motive power. The mills and mines are supplied with all the modern improvements for effectual speed and economical working of pans, settlers, rock breakers, self feeders and gravity for handling ores, wherever possible air compressors for hoisting, ventilation and drilling, a machine shop and saw mill for preparing timber and lumber. The mill and machinery was built by the Union Iron Works, of San Francisco, and it is estimated by Manager Attwood that the ores can be mined, milled and put into bullion, at a cost not to exceed eight dollars per ton.

Mr. Attwood reports the mining interests in Montana as in a very prosperous condition, and that the advent of the Northern Pacific R. R. has given a new impetus and life to this branch of industry. At Butte City, Haggin and Tevis mines are turning out large quantities of ore and bullion.

Adulteration of Tin.

At the last meeting of the California Academy of Sciences, Dr. Henry Gibbons, Sr., submitted for inspection some sheets of pure and adulterated tin such as is used for canning vegetables, etc. He suggested that probably cases of poisoning which had been reported, where people had eaten vegetables, fruit, etc., from tins, were due to the lead used with the tin to cheapen it. In some cases whole families were attacked with cholera morbus from this poisoning. Acids developed by fermentation, acting on the lead adulteration, take up arsenic and antimony. Salts of lead are all more or less poisonous, and produce colic. It has, unfortunately, become too common to adulterate pure tin with lead, to cheapen its cost in making cans.

Mr. Evans, a chemist, said there was no doubt about it. He had tested and analyzed asparagus juice, which contained a little tin and more lead; for lead mixes much easier, and a mixture of lead and tin also gives off tin easily, when pure tin alone would not be soluble. Our canning interests are far too important to be jeopardized by any such practices, and legislation should be invoked to protect our people, unless our Board of Trade and Chamber of Commerce can remedy the evil.

Mr. W. T. Garratt, of this city, had brought the subject to the attention of Dr. Gibbons, and suggested that the poisonous elements sometimes found were due to the lead with which the tin was adulterated, rather than to the tin itself. Tin is a metal somewhat expensive, and the lead is used to cheapen the tin sheets, used in making cans. Lead is used to coat the can first, and is acted on more readily by the acids than tin itself. Salts of tin are hard to form; but salts of lead are easier, and all more or less poisonous, some of them badly. Legislation should be invoked to prevent people making cans of this sort for the purposes of containing food substances. Society should be protected against this sort of adulteration. If iron is coated with pure tin, instead of tin and lead, there are no bad results. On comparing the sheets submitted, the difference was readily discernible to the eye. Those of pure tin were bright and lustrous; while the adulterated sheets are of a bluish tint and dullish in luster. As cans are usually covered with labels, the metal is not much seen, but the metal once seen can readily be distinguished.

Academy of Sciences.

The regular meeting of the Academy was held on Monday evening, Vice-President Harkness in the chair. A. Pierce was elected a life member, and Richard H. Sinton a resident member. Among donations to the Museum were several of peculiar interest. One was the seedless fruit of an egg-shaped plant from Guatemala, which grows there wild, and shows a marked affinity to a seed-bearing variety found only in Asia.

Dr. Behr stated that the plant found in Guatemala, being seedless, must have been propagated fully one thousand years from slips, to have become capable of a seedless reproduction. The fruit exhibited at the Academy was raised by Dr. Gustav Eisen, at Fresno, Cal., under glass. Dr. Behr thought its existence testified to a very ancient civilization in Central America, and an intercourse between Asia and America in very remote ages. A large block of volcanic pumice was received from Los Angeles, Cal., where large quantities drifted ashore about Jan. 8, 1884. Charles Walcott Brooks stated that as the drift of the current in the North Pacific Ocean was about 14 miles a day, it probably came from the eruption of Bogosloy, in Alaska, about October last, as the time was insufficient to bring it from Java; neither was it like the pumice emitted from Krakatoa in August last, nor like Hawaiian lava.

From Los Angeles come reports of a renewal of red skies before sunrise and after sunset. In many parts of the State a peculiar orange yellow covers the entire Eastern hemisphere an hour before sunrise, being especially bright along the horizon. This disappears at sunrise. Dr. Gibbons thought the whole upper heavens had been charged with vapor far above our atmosphere for six months past, and this may explain some of the extraordinary and unusual variations of the barometer lately noted.

The question of the use of adulterated tins or cans for fruit, etc., was discussed. This is referred to elsewhere in this number of the PRESS.

A Hand Grenade Fire Extinguisher.

Some time since mention was made in these columns of a new system of extinguishing incipient fires by the use of glass hand grenades. These grenades are made of glass, which, on being thrown into the fire, are broken and the contents liberated. Gases are immediately generated, which prevent the fire gaining headway. They have been rapidly introduced in the Eastern States, and are now being put into use in this city, where an agency has been established. The Harden hand grenade fire extinguisher consists of a glass globe filled with a chemical fluid, highly saturated with, and generating in fire-heat, an immense volume of fire-extinguishing gas, in which it is impossible for combustion to continue. The fluid itself is perfectly harmless to person or clothing. These grenades, when broken on a fire, discharge large quantities of fire extinguishing gas sufficient to cover a very broad surface of flame, and the action of the fire upon the fluid causes still further generation of the gas.

A public trial of these grenades was made at the Sand Lots on Thursday, before the Chief of the fire department, the fire patrol, and insurance and newspaper men. A wooden chimney was built, and the interior saturated with a mixture of coal oil and benzine. The flames shot up 20 feet, but one grenade thoroughly extinguished the fire. Then a structure of light wood, to represent walls of a room was built, and against the wall was placed a lot of loose, broken timber, and the whole saturated with benzine and coal tar. When lighted, an unusual blaze resulted. Several of the bottles or grenades were broken on the fire and it was speedily extinguished. The Chief Engineer of the fire department and the Captain of the fire patrol expressed themselves thoroughly satisfied with the results of the trial, considering the hand grenades very useful for extinguishing incipient fires.

The general rule to be always observed in using the grenade is this: Take quickest and surest method possible to break the grenade and scatter the contents on the fire. If the fire covers a hard flat surface, like the walls or floor of a room, throw the grenades against the surface of fire hard enough to break them and scatter their contents over the fire. If fires occur in a soft substance, like a pile of rags, hay or shavings, toss a few grenades into it, and break them by throwing other grenades against them. If simply thrown into the fire the heat will soon break them and smother the flame. If the fire can be approached close enough to do so, it is a quick and effective method of quenching it to take two of the grenades by the neck and break them violently against each other over the fire. These general directions will enable any one to master a fire of even larger extent by the use of a little common sense.

Among the merits claimed for this grenade by the makers are the following:

It is small and convenient for handling, can be hung up around every floor of the house office or factory, accessible at any instant's notice. Night watchmen can carry them in their pockets while making their regular rounds.

It is always ready for immediate use. They do not require an engineer to use them, nor a man to convey them. Any man, woman or child, capable of throwing a ball, can use them efficiently.

They are hermetically sealed, will keep for years in any climate. This is an improvement over any other fire extinguisher in existence. In other extinguishers the charge, to be effectual must be used soon or be replaced.

The fluid contained in them is perfectly harmless, and will not injure person or clothing.

These grenades are made to stand a temperature of 25 *degrees below zero*, by actual test.

A special recommendation is their cheapness. A dozen grenades can be furnished for about the same price as a dozen extra charges for ordinary extinguishers. No attention is required as the flask or grenade stands on a shelf or any convenient place ready for use at any time, and any servant girl will know enough to throw it into the fire. They will put out a coal oil, alcohol or benzine fire. A number of them can be distributed through a building ready for use at any point. There is no corrosion or wearing out, and there is nothing to get out of order.

In extinguishing fires with this appliance there is no damage except to the fire, as there is no drenching with water or eating of acids into carpets, furniture, etc.

The grenade is particularly adapted for places where the water supply is scant. In quartz mills, mines, etc., it will be specially useful.

It is the gas that extinguishes the fire, and not the liquid. The contents of the grenade are harmless to persons or clothing. The fire extinguishing gas of the grenade is generated by heat. When a grenade is broken into fire the entire contents vaporize into the gas, filling a large space, within which it is impossible for fire to live. The gas is generated in the fire itself, where it is wanted, and there is no waste. This gives a large volume. One grenade after another can be broken in the fire if it has good headway. If a flue is on fire, a grenade broken in the stove will extinguish the fire to the top of the chimney. These grenades will not explode until subjected to a heat of over 200 degrees, which is a very valuable feature and makes them automatic. They can be placed in the holds of ships, in garrets and other out of the way places where fires are likely to occur, and will act themselves when there is sufficient heat. Public tests and trials of these machines have

HAND GRENADE FIRE EXTINGUISHER.

been made in many cities. The chiefs of fire departments in large cities have endorsed them, and hundreds of large establishments have adopted the system. The flask or grenade is of colored glass, and somewhat ornamental in appearance. An engraving of one is shown on this page. Mr. H. H. Gross is the agent for this coast, No. 21 New Montgomery street.

THE BIG MINING SUIT.—A dispatch from Eureka, Nev., dated the 8th, says: After two days' argument before Judge Rives, of the District Court here, he this afternoon virtually denied the motion to continue the suit of the Albion vs. the Richmond for a half-million dollars damages, conditional upon stipulations to be made by a meeting of the Court to-morrow morning. Great interest is manifested here, as, on account of the suit, the Richmond has closed down the mine furnaces and refinery, thereby throwing out of employment a large number of laborers. Hon. Thomas Wren, assisted by A. E. Cheney, is counsel for the Richmond, and Hon. William Stewart, W. S. Wood and Baker & Wines are counsel for the Albion. The motion for continuance was made, on the ground that the same issues were now pending in the United States Supreme Court.

MANUFACTURERS' ASSOCIATION.—The Manufacturers' Association on Monday held a meeting, when Holbrook, Merrill & Stetson, the Giant Powder Co., the Standard Sugar Refinery, the Continental Oil and Transportation Co., Waterhouse & Lester and I. W. Taber were elected to membership. The question of Mexican trade was discussed, the members seeming to think that St. Louis was getting ahead of San Francisco in that regard. The Secretary was authorized to open and maintain a branch office of the Association at the Mechanics' Pavilion during the continuance of the fair.

Mill Sites.

Some time since, Mr. J. B. Haggin, of this city, made application at the Land Office of his mineral entry for the Mariposa quartz mine, and mill sites Nos. 1 and 2, Coso district, Inyo county. Payment was made, and final certificates issued to Mr. Haggin. One mill site contained 4.50 acres, and the other (0.50) one half an acre. The Commissioner of the Land Office decided that the U. S. Statutes, and the regulations of the Land Office did not contemplate that more than one mill site or tract of land for milling purposes may be embraced in an application for patent for a lode claim, and therefore directed the cancellation of one of the mill site tracts. From this decision, Mr Haggin appealed to the Secretary of the Interior. The question for him to decide was whether, keeping within the restriction of five acres of non mineral land, more than one mill site could be embraced in the application for a vein, and patented therewith.

In his decision, the Commissioner called attention to the clause in Section 2,337 R. S., which provides "that the owner of a quartz mill may also receive a patent for his *mill site*, as provided for in the Section," and to that part of the Section which provides for holding "a *piece* of non-mineral land" for milling purposes. The construction of the law by the Commissioner showed that he based his decision on the ground that in said Section the singular number only is used. If there were any force in that view, in general rules of construction, it would not avail here, because the fourth Section of the Revised Statutes provides that "words importing the singular number may extend and be applied to general persons or things; words importing the plural may include the singular." The regulation, therefore, which follows the statute, should, in that respect, be construed in like manner as the statute.

The Secretary of the Interior reverses the decision of the Land Commissioner, and says in his opinion, Section 2337 does not require that construction placed upon it; and since the amount in both locations does not exceed five acres, he thinks in this instance both mill sites should be permitted to stand. He adds that in both instances it might be necessary for the owner of the lode to use or occupy only one piece of non-adjacent surface ground, and in other instances more than one piece might be necessary and proper. He thinks the practice under said section should be to allow the entry of such number of pieces as may appear to be necessary for mining and milling purposes.

THE SMALL HOPES CONSOLIDATED MINING Company of Colorado paid a dividend of thirty cents per share, or $75,000, on the 19th of June. This is the sixth dividend, and the total is $262,500.

Gold and Silver.

The annual clean-up and settlement at the San Francisco mint was commenced a few weeks ago. The coinage for June was $1,180,000 in $20 pieces, and $300,000 in silver dollars. The coinage for the fiscal year ending June 30, 1884, was as follows:

Double Eagles		160,000
Eagles		152,500
Half Eagles		651,000
Total Gold		$ 5,043,500
Standard Dollars	$4,800,000	
Dimes	50,000	
Total Silver	$4,850,000	1,850,000
Total Gold and Silver		$ 6,893,500

In addition the mint executed an order for $1,000,000 in silver coin for the Hawaiian Government between the 1st of November, 1883, and the 1st of June, 1884.

Over $1,000,000 in gold coin and bullion was shipped from here in June. Of this $776,981 went to Hong Kong; $137,000 to Yokohama; $75,000 to Honolulu; $2,500 to Gambier Island; and $33,650 to New York.

The treasure shipped from this city through mercantile channels for the first six months of the year was $6,582,805, of which $2,835,669 was in Mexican dollars; $2,376,034 in silver bars; $470,075 in gold coin. In addition to this there were shipments of $880,800 by registered mail, making in all $7,463,605.

A short time since we published an account of the immense stock of gold and silver at the Sub-treasury in this city. The cash balance in the treasury here on July 1st, was as follows:

Gold coin	$49,373,000
Standard Dollars	18,010,000
Fractional Silver coin	7,799,711
Nickels	19,600
Paper money	7,670,000
Total	$82,872,311

The gain in gold coin for the month of June was $1,371,000. As there was only $1,180,000 coined at the local mint in June, and as there was $63,295 sent to Hongkong and New York, there was a net loss to local circulation of $254,295 in gold coin in June. Treasurer Spaulding has withdrawn nearly $10,000,000 in gold coin from local channels of circulation in the last six months. As only $8,747,500 has been furnished to the local mint in the past six months, and as $1,350,825 has been sent out of the State in the same interval and $9,910,000 has gone into Government vaults, it follows that there is $2,513,325 less in circulation than on January 1, 1884

THE CUMMER ENGINE CO. have shipped another one of their Ballantine ice and refrigerating machines recently to the Robert Portner Brewing Co., Alexandria, Va., and will shortly ship two more of these machines to the Buffalo Co-operative Brewing Co., Buffalo, N. Y. The refrigerating machine recently shipped by the Cummer Co. to Albert Ziegele & Co., of Buffalo, has been started up with great success, and the purchasers are much pleased with its performance. The Cummer Engine Co. have just furnished a 225 H. P. engine to the Amoskeag Manufacturing Co., of Manchester, N. H., and will in a few days ship a 67 H. P. engine to Messrs. Stules & Kile, of Orwell, O. The following orders have just been placed with the Cummer Engine Co.: A 55 H. P. engine, with complete outfit, for Messrs. Todd & Hosford, Eugene, Ind.; one of 35 H. P. for Carlton, Foster & Co., Oshkosh, Wis.; and a 55 H. P. outfit, complete, for A. Dietly & Son, Moorheadville, Pennsylvania.

RIVERS AND HARBORS.—Among the appropriations by Congress, in the total of $13,609,200 for improvement of rivers and harbors, are the following items: Humboldt bay, Cal., $62,000; Oakland harbor, $139,600; Wilmington, $50,000; Coos bay, Oregon, $30,000; Yaquina bay, Or., $50,000; Sacramento and Feather rivers, Cal., $40,000; San Joaquin river and Stockton and Mormon sloughs, California, $20,000; Colorado river in Nevada, California and Arizona, $25,000; month of the Colorado river, $100,000; Columbia river at Cascades, Oregon, $150,000; Columbia and Lower Willamette, below Portland, Oregon, $100,000; Upper Columbia and Snake, $20,000.

CENTRAL PACIFIC ANNUAL ELECTION.—The annual election of Directors of the Central Pacific Railroad Company was held yesterday at the office, Fourth and Townsend streets. About 20 persons were present, the voting being almost entirely by proxy, and out of the 590,000 shares, 420,000 were voted, the result being in favor of the old Board: Leland Stanford, C. P. Huntington, Charles Crocker, C. F. Crocker, Timothy Hopkins, W. V. Huntington, E. H. Miller, Jr.

English vs. American Policy.

England, despairing of holding her own in the cotton markets of the world, is resorting to the desperate policy of transferring a large portion of that industry to India, where she hopes to utilize the cheap labor of her two hundred and fifty millions of serfs, who are glad to give a day's work for ten cents and count fifteen hours to the day. Although this movement is only in its infancy, still her capitalists have already upwards of seventy cotton factories now in operation there, with about 19,000 looms.

This experiment is a most dangerous and demoralizing one, as is already becoming apparent to the intelligent and thoughtful English statesman. England originally planted herself in India with the expectation of founding there, or rather of building up in that region, a large market for her home productions, and incidentally securing the control of certain products, under her own rule, for which she would otherwise have to depend upon foreign and more or less hostile nations. But scarcely have the people of that region been educated up to see and feel the ordinary wants of civilization before her capitalists engage in the work of putting into the minds and hands of those people the intelligence, skill and tools to supply themselves with their new-found needs. England did not do so with her American colonies. Perhaps they taught her a lesson in that direction which she does not care to have repeated. The policy may be all right, ethically considered, but its damaging effect upon the English people will be all the same, and its demoralizing tendency upon the masses will be none the less for the moral and civilizing aspect which it assumes.

In fact the movement has already become a disturbing element, not only among the masses at home, but also among the capitalists there who have invested their means with the view of giving employment to their own people and seeking a market for the products of their labor in India. Notwithstanding the consumption of cotton goods is rapidly increasing in India, their importation from Great Britain is falling off. Within the last three years the falling off has been about 10 per cent. And what is still more significant, India is already entering foreign markets with her manufactures in direct competition with the United Kingdom. Indian statistics show that the importation of piece goods from India to China rose from 15,000,000 yards in 1880 to upwards of 41,000,000 in 1883! Moreover, hitherto the bulk of the Indian trade in general has been largely with the United Kingdom, but now the complaint comes up that that too is falling off. Carefully prepared statistics show that the total amount of decrease in this direction from 1877 to 1882 reaches within a small fraction of 10 per cent!

The fact elsewhere noted in these columns, that of the 40,000,000 spindles which represent the cotton manufacturing industry of this date in England, at least 20,000,000 are running at a loss, 2,000,000 are idle, and only eight out of the 18,000,000 remaining are holding their own, speaks volumes to the thoughtful statesman as to what the near future may bring forth.

And it is not in the cotton industry alone that India looms up as a future rival to the home Government. She shows very nearly a similar development in the jute fabric; also in the manufacture of boots and shoes. Coal, iron, steel, paper and leather are also being produced. Raw cotton is also being largely produced there, while her production of wheat is getting to be enormous, and has already seriously affected the market for American wheat among the buyers of Europe. In these two latter cases, England may be the gainer, and the United States the loser.

But taking the aggregate, England, by her own act, is brought into direct competition with the cheap labor of India—the cheapest labor in the world. That step is already telling with fearful effect upon her idle, starving masses at home. What will they do about it? But one way seems open to them—emigration to this country, where the true policy of home protection prevails. We have a country large enough and broad enough for all the intelligent, skillful, but down-trodden masses of Europe—large enough to give them all a farm. We have no entangling alliances abroad; but we do not seek either to control or incorporate into our body politic the ignorant, half civilized people, who may be found either upon our outlying borders, or in more distant regions. We are willing to extend to all such, a kindly, helping hand. We would do what we reasonably can to raise them to the level of civilized humanity, and look for our reward simply in the satisfaction of serving a neighbor and accepting the incidental and greater benefit that would naturally accrue from contact with an industrious and civilized people, over a half civilized, ignorant and idle people.

We have adopted the policy of keeping out from our borders all objectionable classes. We want none but such as can assimilate with us. We have already put up the bars against Asiatic half civilization, and we are now engaged in strengthening them. We have a similar work to do with the ignorant pauper labor of other parts of the world. That work will soon be done. But we welcome with open arms, intelligent and skilled labor, such as comes to us in good faith, to accept our policy of protecting ourselves; to sustain a free and popular form of government, to establish and encourage the family relation and the christian form of marriage. Such people always come with something wherewith to help themselves. They make good citizens, good neighbors, good commonwealth builders. We have room for all such. We bid them welcome—welcome to our broad acres, welcome to our shops, and welcome to all the relations of life and business.

The policy we have adopted is self sustaining. With a land, stretching from the northern Arctic to the southern tropics, we can produce everything we need, and live comfortably and respectably while we produce it, and we don't propose to allow the pauper, or serf labor of outside nations to interfere with our internal relations. We propose to raise our own food, our own raiment, our own luxuries, our own circulating medium, and everything we need or want, and to allow the producer such a fair compensation for his labor, as will enable him, and his family, to live as an intelligent civilized man should live.

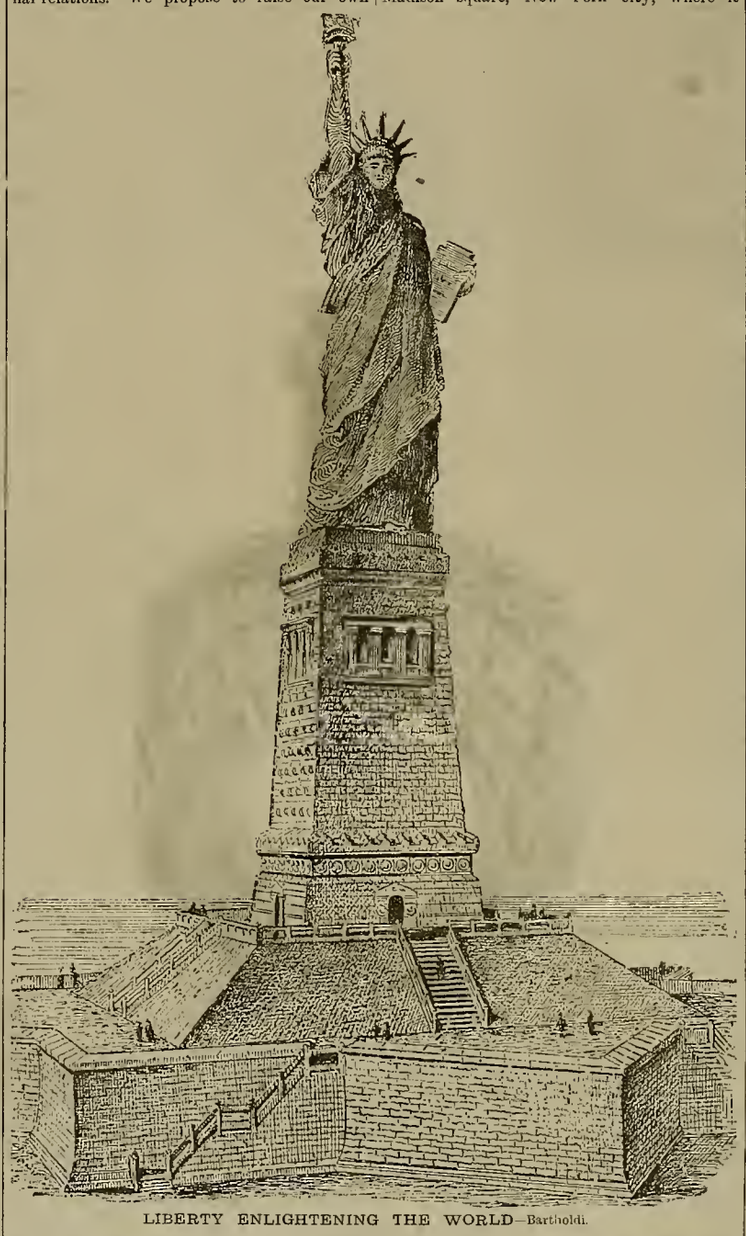
We have within our own limits, the best market on earth, and we propose to hold it against all countries. Our people stand unrivalled in education, in mechanical skill, in productive power, and in mercantile aptitude. Our country is without a rival in the variety, or quality of its productiveness. There is no country on the globe, that can come nearer to absolute independence of all others than our own. We can provide our own markets, and when we have a surplus, we have the markets of the world to chose from. Our cereals, our staples, our fruits, our manufactured goods of every class have no superior, anywhere, and our skilled and intelligent labor aided by the best mechanical appliances is, as a general thing, able to cope with the cheap labor, and less skillful appliances of all competitors. When the need comes, we can enter all the great markets of the world.

We now number but 50,000,000 of people; but we have room enough for five or six times that number. And when our present limits are full, and we need more room, we shall know where, and how to get it—the whole boundless continent, may be ours from the northern to the southern Arctic.

Bartholdi's Great Statue of Liberty.

We give herewith an engraving of the famous statue of "Liberty Enlightening the World," designed by Bartholdi and presented by France to the people of the United States. The money was raised by popular subscription in France, and the funds were all subscribed in 1880 and the work of casting the bronze begun forthwith. Since that time the work has progressed to completion, and the raising of funds in this country to provide for the pedestal and for the erection of the statue has been under way.

The huge torch-bearing hand of the figure was made first, and was exhibited at the Centennial in 1876. After that it was taken to Madison square, New York city, where it waited for years the coming of the other members from France. It is impossible to give any adequate idea of the imposing magnitude of this figure from an engraving. Beside it, the collossus of Rhodes, the boldest achievement of ancient art, would appear but as a child.



LIBERTY ENLIGHTENING THE WORLD—Bartholdi.

It is the intention to set the statue at the entrance to New York harbor, on Bedloes island. Facing the sea, the statue will serve the double purpose of a light tower for the guidance of incoming ships and a type of the grandeur of the New World, in its physical features and its political institutions and influence. Bedloes island is small, yet ample for the intended purpose. It will furnish a base for the statue, perhaps twenty feet or so above the water. On this will rest the pedestal 110 feet high. The statue to the flame of the torch in the uplifted right hand is 145 feet high. This will make the light at least 275 feet above the level of New York bay, making it visible many miles at sea. The statue is cast in bronze, in pieces of manageable size, to be rivited together when erected upon its permanent site.

Mr. Bartholdi is an Alsatian by birth and has achieved an enviable fame as a sculptor, several of his works being of gigantic size. After the Franco-Prussian war he spent several months traveling in this country. Subsequently he was chosen by the French government to prepare a suitable testimonial for the sympathy and diplomatic service rendered by the United States during the investment of Paris, and the result, a statue of Lafayette, now graces Union Square, in New York city.

As an American undertaking, a colossal statue of this kind and for the purpose stated might seem unbecomingly ambitious, not to say bombastic, but as a gift from a friendly and appreciative republic across the sea its design and purpose cannot be misconstrued.

The exhibition of this great work in our columns we deem especially appropriate to the occasion of the National Holiday. The idea expressed in the commanding figure in the engraving is the same in essence as that which was declared July 4, 1776, and which is the mainspring of our great success and progress as a nation.

Padre Junipero Serra.

The following address has been issued to the people of California, and signed by Gov. Stoneman and about fifty of the most influential citizens of the State:

On the 28th of August, next, California will commemorate the one hundredth anniversary of the death of her first pioneer, the founder of Indian missions, Padre Junipero Serra. After a long life of sufferings, sacrifices and hard labor, in the service of his beloved Indian flocks, this venerable priest yielded up his spirit to God, and his body was laid at rest under the stone flags of the old church of San Carlos, in Carmelo valley, the scene of his labors and death. The Mission of San Carlos, first established at Monterey on the 3d of June, 1770, and removed to Carmelo in December of the same year, was the second mission founded in Upper California by Father Serra, President of the Franciscan Missions. Of the twenty-one missions established in California a few are well preserved, others are in ruins, and of some not a vestige is left to mark the spot where they once stood. The most picturesque and poetic of these historic landmarks of our State, and the noblest work of Padre Serra, is the old stone church of San Carlos at Carmelo, and it is a sad spectacle and a reproach to California to see this venerable pile, through neglect and apathy, slowly crumbling into dust. Inexorable time has laid his finger on this relic of religion and civilization, and leveling it to earth, until, quite recently, the Rev. Angelo D. Casanova, the pastor of Monterey, undertook to stop the work of destruction and preserve to California this monument of the life and labors of the venerable Padre Serra and his last resting place, and also that of some of his co-laborers in the missions, and a few of the early Governors of California. The restoration of the old church is going on. Already $4,000 has been expended on it, and the total cost is estimated at about $15,000.

It is hoped that the work will be completed by the 28th of August next, and the centennial anniversary of the death of the energetic pioneer will see his work as it stood when his body was laid under the flags. We now make an appeal to the people of California, irrespective of creed, to pay a tribute of respect to the memory of this venerable man by assisting with their means in the restoration of the old stone pile, that it may stand, through coming ages, a monument over the grave of one whom we revere, respect and love.

We ask Californians to help this undertaking by forming committees in every town, and forward their collections to Father Casanova, at Monterey, that this building, one of the first fruits of civilization in our beloved State, may be restored, and the centennial anniversary of Junipero Serra's death commemorated in a manner worthy of the good pioneer priest.

MACHINERY has done much in America in cheapening the cost of agricultural products, but the limit of efficiency in that direction has by no means been reached. The vast prairies of the West would seem to be specially adapted by their level surface to the operation of steam plows, yet thus far but little progress has been made in the substitution of steam for horses. Experiments have been frequently made of a favorable nature. Last week at Fargo, Dak., a traction engine drew eight plows, turning a sod four inches thick as evenly and well as could be done by horse-power, and at a rate of over 25 acres a day. As the cost of steam plowing is rated at about $1 per acre by these experimenters, as against $3 by horse-power, the adoption of steam plowing ought to proceed rapidly, and we know of no place in the world where it ought to prove more successful than in California.

AMERICA'S GROWING IMPORTANCE.—The United States, great and important as she now is, has a much greater and more magnificent future before her. But a little over a century old, she must soon become the largest and most influential nation on the globe. Foreigners are already beginning to appreciate her present and growing importance. A French paper recently said: "A hundred years ago America was almost nothing, fifty years ago it began to be something, now it amounts to a great deal, and there is every reason to fear that in fifty years it will be almost everything."

SPOKE MACHINERY.—Manufacturers and dealers in spoke machinery report an unusually large demand for this class of machinery, especially from the Southern and Southwestern States.

ENGINEERING NOTES.

The Nicaragua Canal Project.

If the Government is to secure possession of any canal highway between the Atlantic and Pacific there is no question that the Nicaragua route is in every way the most desirable one for American interests. As compared with the Panama or French route it is claimed to be far superior. The French have been at work already nearly three years, and have expended almost as much money as was contemplated in their first estimate, and yet the work is hardly commenced. The climatic conditions in that locality, the enormous depths of the cuts, in some places 600 feet, in soft, sliding earth; the danger that such slopes cannot stand the sudden and tremendous falls of rain, the turbulence of the Chagres river, which sometimes rises sixty feet in twenty four hours, the unhealthiness of the region, and the certainty that the route, even if it is finished, will be worthless as soon as another is made further north, are obstacles that cannot be overcome.

The Nicaragua route, on the other hand, as Lieut. Maury long ago predicted, was designed by Nature as a route for interoceanic transit. It has the advantage of 120 miles of water navigation. The greatest depth of cuts would be 101 feet, the average less than 61 feet. It would command the major part of the commerce of the Pacific, as it is several hundred miles nearer our Atlantic and Pacific ports, as well as China and Japan, for the carrying trade. It passes through a fertile, healthy country waiting to be developed, and its cost is estimated at a comparatively small sum, ranging between $50,000,000 and $65,000,000, an amount which has already been expended by the French company, counting the sum paid for the Panama railroad, with nothing of importance to show for it. The Nicaragua canal when completed will be an American canal that will speedily end the pretensions of the French affair at Panama, and, whether upon commercial or national grounds, there is no good reason why our Government should not possess itself of the advantages which lie in its way by securing and controlling this route of interoceanic transit.

That the Government is in earnest in making this an essentially American route we have sufficient evidence in the fact that the Senate in a recent secret session discussed the the propriety of appropriating $250,000 to secure certain supplemental concessions from the Government of Nicaragua, the nature of which is to secure to the United States the absolute right of way between the Atlantic and Pacific along the route of the projected Nicaragua canal, and thus exclude foreign powers from securing the advantage. With the exception of these, the Senate is unanimous in favor of the appropriation, and as the House Committee on Foreign Affairs has expressed itself in favor of the appropriation also, it is probable that the House will vote its approval when the matter comes before it.

It is more than probable that in the end there will be three ship routes across this narrow portion of the continent: The French at Panama; the English at Tehauntepec by Ead's ship railway, and the American *via* Nicaragua.

THE EADS SHIP RAILWAY.—The new models of the carriage and pontoons of the Eads Ship Railway have started for London. Nearly all the capital for the enterprise is being subscribed in that city. Chief Engineer Corthell says 100 men are at work, and that the first half mile of track has been completed. This, with the river course, which admits three of the largest ships abreast, completes 25½ miles of the Tehuantepec route. The new pontoon system of raising vessels from the water upon the railway carriages is to be substituted for the hydraulic system first contemplated. It was conceived by London engineers and adopted by Eads, and will raise a ship out of water and upon the carriage in 20 minutes.

THE MANCHESTER (ENG.) SHIP CANAL.—The Manchester Ship Canal Bill passed the House of Lords May 23d, conditionally that the work should not be commenced until $25,000,000 of capital was subscribed and issued, and that must be done within three years. Manchester has often surprised the world by its enterprise and energy, and in the whole inception of this canal scheme (which proposes to allow of ocean-going ships reaching the city without unloading at Liverpool), so far as it has yet gone, has proved that those great qualities are as fresh and vigorous as ever. The opinion is confidently expressed that the needed capital will be subscribed for within the time specified.

THE PANAMA CANAL.—It is affirmed that of 90,000,000 cubic metres of earth which have to be excavated from the Panama canal, only 2,500,000 cubic metres had been removed up to October, 1883. In that month more than 10,000 men were employed on the work. It is now proposed to increase the working force to 15,000 men, and it is expected that with better weather the extraction will be materially increased.

THE decrease of the public debt during June was $9,217,256, and the decrease since June 30, 1883, $101,040,971; cash in treasury, $391,985,928; gold certificates, $98,392,660; silver certificates, $119,811,691; certificates of deposit, $12,385,000; refunding certificates, $290,000; legal tenders, $346,681,016; fractional currency, $6,980,061; available cash, $139,887,449.

USEFUL INFORMATION.

Chewing the Cud.

Every child living in the country has stood and watched this curious operation, and wondered what the lump was which he saw come up in the cow's throat, and then go down again after she had chewed it for a certain length of time. And perhaps he may have seen the anxiety and turmoil produced on a farm by the report that some one of the cows had "lost her end," and as the result of this excitement he may have seen the absurd attempt to "make a new end," in the hope that the cow would by such means be restored to good condition. There is in the minds of a large proportion of our readers so little correct understanding of the true nature of "chewing the cud" that a few words concerning it may not be amiss.

A very large tribe of animals, of which sheep and cows are only familiar examples, are called in works of natural history *Ruminantia*, because they *ruminate*, they chew the cud. They do so because their peculiar organs of digestion require it; they can get their nourishment in no other way. They have, it is said in the books, four stomachs, but the statement is not strictly correct, for the entire digestion is done in a single one—that which is called the fourth—the other three being only places for preparatory work. Their food is swallowed without being chewed; the chewing is to come later. When this unchewed food is swallowed it passes directly into the first stomach, to use the common term; but the drink which the animal takes goes straight past the entrance of the first into the second. These two serve only to *soak* and soften the coarse food. When the first has done what it can, the food passes out of it into the second, and then the cow or sheep is ready to "chew the cud."

The second stomach, while busily at work in soaking the food, keeps it in motion, and gradually rolls it up into masses, so that in the small upper part there is formed an oblong solid lump of the size that we recognize as the "cud." This the animal throws up into the mouth, and chews with evidently as much satisfaction as the same act of mastication gives us when we put the most delicate morsels between our teeth. When it is sufficiently chewed, the mass is swallowed and its place taken by another which had been rolled up in the meantime.

But the "cud" thus masticated does not return to the second stomach, from which it had come. It passes smoothly into the third, a place for additional lubrication, and then into the fourth, where the true digestion begins and ends.

This is, in brief, the whole story, and we see how naturally the chewing comes in. It is the same as in our own case, only that it is at a different stage of the food's progress. And we see also what "losing the cud" really is. The cow or sheep is suffering from indigestion; the "second stomach" has failed to roll up the little masses suitable for chewing, and there is nothing which the poor beast can bring up. Of course, therefore, the one thing required is to *restore the tone and power of the stomach;* not to burden it with an "artificial end," which would only increase the difficulty, instead of relieving it.—*Scientific American.*

GLUCOSE IN LEATHER.—According to the *Shoe and Leather Review*, the falsification of the weight of leather by adding glucose, or grape sugar, appears to be carried on extensively in Germany, and the shoe trade societies are taking steps to protect themselves from the imposition. A simple test is recommended, which consists in placing pieces of the leather in water for the space of 24 hours, when the glucose will be dissolved by the water, and the result will be a thick, sirupy liquid. When two pieces of the leather are placed together and left in that position for a time, it will be found difficult to separate them, as the gummy exudations will stick them together. It is stated that some samples of sole leather were found to contain as high as 30 to 40 per cent. of extra weight. Another test recommended is to cut off small pieces of the leather, and, wrapping them up in a damp cloth, lay them away for a few days in a temperate place. If the leather is adulterated, the pieces will be found to be stuck together, and surrounded by a sirupy substance in proportion to the quantity of the adulterant used; and the peculiarity about leather treated with grape sugar is that, after wetting, it is difficult to dry, and resembles gutta percha or untanned leather more than the genuine article.

HOW TO GET RID OF RATS.—The following method has already been suggested, but the experience of the person hereio alluded to may be of service to some who have not tried the the remedy: He caught a couple of large rats in a trap alive, and then besmeared them all over, except their heads, with tar, and let them loose in their favorite run. But he says: "I could not follow these two tar-besmeared rats into their numerous runs to see what would happen; but it is reasonable to assume that they either summoned together all the members of their community, and by their crestfallen appearance gave their comrades silent indications of the misfortunes which had so suddenly befallen them, or that they frightened their brethren away, for they, one and all, forsook the place and fled. The experiment was eminently successful. From that day, in 1875, till now, 1883, my house, ancient though it is, has been entirely free from rats, and I believe that there is no remedy equal to this one."

PAPER HANGER'S PASTE.—Beat up 4 pounds of good white flour in cold water—enough to form a stiff batter—sifting the flour first, and beat it well to take out all the lumps. Then add about 2 ounces of well powdered alum. Have a quantity of boiling water at hand, and pour it gently and quickly over the batter, stirring it rapidly at the same time; and when it is observed to swell and lose the white color of the flour it is cooked and finished. It is recommended not to use it while hot, as when cool it adheres better and goes further. A little cold water poured over the top will prevent the formation of a skin. When about to use, a small additional quantity of cold water should be added, so that the paste will spread easily and quickly under the brush. In warm weather it cannot be kept for many days without fermenting, when it becomes thin and useless. To avoid this, a few drops of carbolic acid added to the mass when it is prepared, will enable it to be kept almost indefinitely.

LUMINOUS PAINT is fast coming into quite general use. It will soon be used for painting door casings and the woodwork of hallways, so that persons may be able to readily find their way about the house in the dark. Railway carriages may be made to glow softly within and without. Gate posts might be made to show themselves more readily than now. In time the outside of buildings might be thus made to make themselves luminous during the night by the light which they have stored up by day. Numerous other uses have already been made of this interesting discovery, and others will readily suggest themselves. The uses to which this paint may be put multiply themselves rapidly as we dwell upon the theme, and will be largely utilized as soon as it can be placed on the market at a moderate cost.

MR. EDISON is a philosopher, as well as a being gifted in other ways. The remark made by him to the effect that "it requires just as much ingenuity to make money out of an invention as to make the invention," will do for him to base a claim on for such honors. The truth of that statement is apparent and is exemplified by Mr. Edison's career. In that he is able to draw this lesson from it, he is a philosopher.

A CHEAP INSECT DESTROYER.—A correspondent of the *Fruit Recorder* says he has boiled leaves and stems of tomato plants until the juice is all extracted, and finds the liquor deadly to caterpillars, lice, and many other enemies of vegetation. It does not injure the growth of plants, and its odor remains for a long time to disgust insect marauders.

GOOD HEALTH.

Suicide and Sleeplessness.

The circumstances attending the recent death of the Dean of Bangor—albeit they are infinitely distressing—present no novel features. The reverend gentleman, according to the *Lancet*, was a man of considerable intellectual "power," which is the same thing as saying that he was constitutionally liable to intervals of mental depression. All highly intellectual men are exposed to this evil. A pendulum will always swing just as far in one direction as it does in the other. Great power of mind implies also great weakness under certain conditions. The marvel is not that great minds occasionally become deranged, but that they so often escape derangement. Sleeplessness means not merely unrest, but starvation of the cerebrum. The brain cannot recuperate, or, in other words, it cannot rest. Physiologically, recuperation and rest are the same thing. Sleep is simply physiological rest. The only cause for regret in these cases is that the blunder should ever be committed of supposing that a stupefying drug, which throws the brain into a condition that mimics and burlesques sleep can do good. It is deceptive to give narcotics in a case of this type. The stupor simply masks the danger. Better far let the insomnious patient exhaust himself than stupefy him. Chloral, bromide, and the rest of the poisons that produce a semblance of sleep are so many snares in such cases.

Sleeplessness is a malady of the most formidable character, but it is not to be treated by intoxicating the organ upon which the stress of the trouble falls. Suicide, which occurs at the very outset of derangement and is apt to appear a sane act, is the logical issue of failure of nutrition that results from want of sleep. It is curious to note how a sleepless patient will set to work with all the calmness and forethought of intelligent sanity to compass his death. He is not insane in any technical sense. He has no delusion. He does not act, or suppose himself to act, under an "influence." He simply wants to die, and, perhaps, not until after he has made an attempt to kill himself will he exhibit any of the formulated symptoms of mental disease.

SCARLET FEVER BY POST AND BY ICE.—A correspondent of the *Medical and Surgical Reporter* narrates a case where it seems tolerably certain that scarlet fever was transmitted by means of a letter. At least there is much less room for doubt than in many cases where such a course is popularly assigned. The outbreak was in a country house half a mile distant from the nearest neighbor, and the family had occupied the house for three years; the children had not been away from the farm for two months, no one had been in the house who had the fever, or been where it was. In fact no case of the disease had been known or heard of by the physician for some months anywhere in the county. It appeared, however, that the mother had received a letter from her brother only a short time before, stating that his family had just lost a child from scarlet fever. This letter contained a photograph. The letter was received only seven days before the first child was taken sick, and the children all handled the letter and the photograph. A newspaper reports that scarlet fever has been spreading in Gloucester City by school children having eaten ice which had been used by an undertaker on the body of a person dead of the disease. The children picked up the ice in the street.

Colds and Coughs.

Coughs and colds are prevalent now, especially among children, too often from ignorance or carelessness of their elder guardians. Many mothers appear to accept with resignation the repeated and violent colds from which their children suffer as providential and unavoidable. A cold is by no means always due to exposure. Indigestion, constipation, a lack of scrupulous cleanliness, the unwise habit of sleeping in much of the clothing worn during the day, unaired bed chambers all, or any of these things may have far more to do with your child's tendency to cold than the keenest breath of the bracing winter air. And in great measure these things are under your control. Mothers should understand that it is a fact, whether they can see how it is or not, that numerous colds and sore throats are directly traceable to indigestion and dietetic errors. Quantities of greasy food, fried meats, pastry, and the like, ill-ventilated rooms, and continued constipation, have to answer for many cases of croup, and putrid sore throats. All these things weaken the system and render it far less able to resist changes of temperature. Give every bedroom a thorough airing every day, more especially if several children are obliged to sleep together, or with their parents. This is to be avoided, if possible; if not, always lower a window slightly from the top—or if this cannot be done raise it from below. There is frequently bad air enough generated and breathed in the sleeping apartment of a family with small children, to supply them all not only colds, but with a number of so-called "malarious" diseases, to last a year, perhaps longer. Neglect of bathing is another prolific source of colds. A child from three to ten years old should certainly receive an entire bath twice a week in winter. A warm bath at night, taking special care to avoid any chill after, will frequently break up a sudden cold. Keep children from playing in chilly, unused rooms in autumn and winter weather. Let them play out of doors as much as possible, taking care to have their feet warm and dry. A flannel suit and rubber overshoes will often save much cough medicine and doctor's bills. Keep them warmly clad, but do not be cootent with thick coats and worsted hoods, while short skirts barely cover their knees, leaving the limbs chilled.

A NEW PROCESS OF TOOTH-DRAWING.—A dentist of Geneva has invented a new and ingenious process of tooth-drawing, which, if introduced, will prove most acceptable to toothache sufferers. I small square of india-rubber, pierced with a central hole, is pushed over the tooth till the upper part of the root is reached. The india-rubber gradually contracts, pulls on the root, and the offending tooth is finally enucleated without causing the patient any pain whatever. Four or five days are generally required to complete the operation. Very slight bleeding and a slight swelling of the gum are the only inconveniences experienced. M. Paul Bert brought this ingenious method before the Academie des Sciences in Paris, when M. Galippe remarked that the process was already known, and quoted a case in support of its efficacy, in which a young girl had placed a ring of india-rubber round her two front incisors, and forgot that she had done so, the result being that she lost the teeth.

EFFECTS OF SLEEPING TOGETHER.—There is a good deal of logic and truth in the theory that injury may be sustained by one of two persons who are accustomed to sleep together. People differ in temperament, and the influence of temperament is either negative or positive. Positive natures are reflective; negative natures are absorptive. Of two persons who generally room together, the positive one, if of weakly habit, will lose elements of strength; they will be absorbed by the negative, and the result in time will be a decrease of physical energy and nervous power, which will be evident. We do not approve the practice of a sickly or weak person sleeping with a strong one. Healthy children of the same age may room together, but we should protest against an old person sleeping with a young one.—*Science of Health.*

MINING SUMMARY.

The following is mostly condensed from journals published in the interior, in proximity to the mines mentioned

CALIFORNIA

Amador.

AMADOR'S GOLD PRODUCT.—Amador *Ledger*, July 4: The gold product of Amador county for the year 1883, as compiled from the receipts of bullion at the Mint and other sources, foots up over $1,750,000, a heavy increase over the production of the previous year, but falling considerably below the estimate of Wells Fargo & Co. Of this amount the Plymouth Con. contributed over $1,000,000, or an average of about $90,000 monthly. The Keystone takes second place, with a total of over $300,000, and the Zeile third, the total output of which cannot be approximately ascertained. The present year is expected to largely exceed the figures of last year.

MISCELLANEOUS.—Work has been resumed at the Gover. Taking out water from the north shaft is in order. To drain this will take between one and two months at least. At the South Spring Hill a contrivance has been put up below the mill for the purpose of saving the fine gold and amalgam that escapes with the slime. It was put in operation this week. The Keystone is also fixing up for the same purpose. Work is to be resumed at Morgan's tunnel in Hunt's gulch forthwith. Proposals are out for making connection between the tunnel and shaft in Murphy's gulch, a distance of 230 ft. S. D. Shugert is interested with Mr. Morgan in the project.

Calaveras.

INTEREST IN A MINE SOLD.—*Chronicle*, July 4: A half interest in the well known Excelsion gravel mine, near the French Hospital, was sold one day this week for $1,000. The mine was owned by Judge E. Fahey and Mr. Manuel Nunes of this place. Mr. Nunes has disposed of his half to Mr. A. Knell, formerly Supt. of the Gleeson mine in Chill Gulch. The mine is a good piece of property, and we are informed that active operations will he commenced immediately.

El Dorado.

THE MELTON MINE.—Placerville *Observer*, July 5: This mine is situated about two miles north from the Mt. Pleasant, and, doubtless, is on the same vein of ore, in Mountain Township, its Postoffice address being Grizzly Flat. It is owned by an Eastern Co. with plenty of money, who purchased it some two years ago, and of which H. H. McClellan has been Supt. ever since, and during that time has done an immense amount of development work, on the mine, besides putting up a 15-stamp mill on the north end of the mine, which has already crushed a large amount of ore from tunnels No. 2, 3 and 4, much of which has been highly remunerative, and some of it lately worked went as high as $50 and $60 to the ton. It was found impracticable to work the mine through a shaft in consequence of the large amount of water they had to contend with, so the tunnel process was resorted to prospect, the claim being most favorably located for the purpose. Tunnel No. 2 has been run in 400 ft, and much of the ore in the last 100 ft run, went as high as $50 per ton. Tunnel No. 3 is in 350 ft, No. 4, 200 ft, and No. 5, 150 ft. All are in the hill about the same distance, and the ore in each is best near the end. Tunnel No. 1, 200 ft below No. 2, is now in 60 ft; the ore vein has not been encountered, but will be very soon, and will be followed through the hill 2,000 ft, to the south end of the claim, where hoisting works have been erected and the ledge sunk upon to some depth, the ore going $12 per ton. This tunnel will drain the mine to a depth of over 600 ft, and if the ore proves as extensive and as rich as that 200 ft above, and as the mine has steadily improved with depth, there is no reason to doubt that it will not be better, it does not require very close calculation to figure up the immense value of the property. An air compressor and drills are now being placed in position to facilitate the driving ahead of tunnels 1 and 2, and the ditch which supplies the motive power is being enlarged to a capacity of 500 inches, and by another week it is expected that everything will be in readiness to start up along the whole line, and no mine could possibly he better equipped for effective and economical working.

Inyo.

MODOCK.—Inyo *Independent*, July 5: Supt. Fitzgerald sends us the following: Coal is coming in in regular and will have enough to start up with by the 9th instant. During my absence there was extracted 120 tons of ore and selected slag. Total at furnace, 609 tons. The average of the ore, new find, is 43 per cent lead, which is the highest ever attained in this camp. I will be able to work in considerable quartz ore which has been laying here for years. This lead ore is being extracted from No. 2 tunnel of the Confidence mine.

SNOW'S CANYON.—"Miner" writes us that W. K Miller started the Snow's canyon mill on the 1st of July on ore from his mines at Wild Rose. He has had a 12 mule team hauling wood and ore for the last month. He is the first to take out ore from these mines. Smith and others will furnish ore to the mill. Snow's canyon is coming to the front as a bullion producer. There will shortly be some glowing items from this forgotten district.

MAXIM MILL.—The Maxim mill will commence crushing ore from the company's mine next Monday. There is enough ore on the dump to keep the mill pounding away for a long time.

Mono.

BODIE CON.—*Free Press*, July 7: During the past week there was 327 tons of ore crushed at the mill. The average assay value pulp was $23.48, and of the tailings $2.40. The south drift from upraise No. 4 is in 20 ft. The north drift from same is in 104 ft. Upraise from 500-foot level, Fortuna vein, is up 42 ft. The south drift on 550-foot level is in 56 ft. There is no change to note in the mine.

BODIE TUNNEL.—Advancement 14 ft last week, north drift, on 200-foot level.

STANDARD CON.—We extracted and shipped to the mills 504 tons of ore; received 795 ounces of crude bullion and shipped to the company this day $6,879.24. South drift No. 1 from south winze No. 2, 385-foot level, has been extended during the week 10 ft, and is now in 126 ft. The vein shows a width of two ft. Everything is running smoothly at the mines and mills.

BULWER CON.—The south drift from west crosscut No. 2, 4500-foot level, has been advanced during the week 10 ft; total length 317 ft. The vein continues about 1½ ft wide.

SHIPPING ORE.—Homer Mining *Index*, July 8: The Gorilla began shipping ore to mill last Sunday, but soon afterward an accident occurred which caused a suspension of shipments for nearly three days. The brake on the bull-wheel failed to work while a loaded car was descending, when the car was precipitated to the foot of the mountain with great force, doing considerable damage to the ore chute and bin. At the same time the ascending (empty) car flew up the mountain with equal velocity until it reached the end of its tether, when the cable snapped and the heavy iron car was thrown high into the air and then went thundering down the precipitous slope, a distance of about 2,600 ft being badly wrecked. Everything is now in good running order. It turns out that it was Uncle Dan Oisen, and not a Mexican who made the rich discovery near the head of Callihan creek, mentioned last week. A tunnel is being driven in with the vein, and is gaining one foot in depth for every foot in length. The vein is four ft in width, is enclosed in porphyry, the quartz so decomposed as to be readily torn down with the pick, and the whole bears a striking resemblance to the surface workings of the Standard mine in Bodie. The rich streak varies in width from five to eight inches, but the whole width of the vein carries gold, and the entire mass taken together, will probably average $70 to the ton. A pack-train started on Tuesday transporting ore from the Bryant mine to the Butterfield mill, which has been put in good running order and will be started up to-day. As Bryant ore is all of high grade, additional blanket sluices have been put in and arrangements made for saving the whole of the concentrates. The mine is looking as usual, both the north and south drifts, 130 level, being still in fine ore, and the dump is over-crowded with ore from the same level. The May Lundy mine is running full handed, and the mill is kept up to its full capacity. The bullion shipments are regular and, we learn incidentally but indefinitely, are large, but the amount or value thereof the public is not allowed to know. The road from tramway to mill is in excellent condition, and the ore yard at the mill is being gradually filled up. Nothing definite is known of the current yield of the Virginia creek hydraulic mines, but it is safe to conclude that it is quite heavy, as the company has the greatest aboundance of water, favorable weather and a large area of gravel known to be rich in coarse gold. Eighteen pounds of gold was the result of a single cleanup a few days since. The Great Sierra tunnel, Tioga district, is said to have reached only the selvage or eastern and somewhat massive casing of the Sheepherder ledge, and not to have penetrated the vein proper. The flow of water from the face is still heavy. Work has been suspended for a week or so, and the miners have scattered off to visit their friends. Next week this (Homer) district will have three quartz mills running and three mines producing bullion regularly.

Nevada.

RICH ORE.—Nevada *Transcript*, July 3: A candle-box of specimens from the Peabody mine in Grass Valley township, were brought to this city yesterday, and twenty pounds of the ore being crushed, yielded $145 in free gold. The Peabody is now open to a depth of 190 feet, and is producing ore from two levels right along. The average yield approximates $100 a ton, the ledge being from 6 to 12 inches thick. Among the stockholders are J. E. Brown, Phil. Richards and John Spaulding of the city, the first-named gentleman being President of the Company.

NORTH BLOOMFIELD MINE.—Grass Valley *Union*, July 3: About forty men are employed at the North Bloomfield mine, thirteen of them being engaged in running prospecting tunnels into the face of the bank to ascertain if the mine can be profitably worked by the drifting process, and most of the balance putting in their time cleaning bedrock. The main prospecting tunnel is in a distance of 100 feet, and is being put forward at a good rate.

Placer.

THE GOLDEN GATE AND OTHER RICH MINES.—Placer *Argus*, July 3: We were shown a number of nuggets of gold a few days ago which were taken from the Golden Gate Placer Mine near Iowa Hill, worth all the way from $3 to nearly $100 each, amounting in all to several hundred dollars worth. This gold we are informed is only a small portion of like gold, which has been picked up from the bedrock within the last month, during the process of working the mine. We can call to mind several very rich mines of to-day, which were abandoned in early days after the owners had supposed the claims were all worked out; for instance, the Watt Brothers' mine near Iowa Hill; the Weske mine at Sucker Flat, near Iowa Hill; the Golden Gate mine in the same vicinity; of which are demonstrating by their yield of gold from the rich pay channels back in the hill that many of the early owners in these mines abandoned the fortunes that lay hidden just a little further back. The Watts Brothers' tunnel is several hundred ft in and they are taking out good pay; Mr. Weske is employing quite a large force of men and they are a long distance into the hill and are working both ways on the channel up and down the ridge and taking out big pay. The Weske or Sucker Flat channel and the Golden Gate channel are supposed to be one and the same lead. These mines are situated only a short distance from each other, and from the similarity in the gold and also in its these two mines are working on one and the same formation there can be hardly be a doubt but what channel. Both of them were found to be very rich in front, and when the front of each were worked out it was thought the mine was worked out, but subsequent developments show the fallacy of this theory. Mr. Weske has taken out several large nuggets ranging in value from $100 to over $1200 each; and from the quality and quantity of the gold shown us from the Golden Gate mine the other day, it would seem that the present owners of the mine are now on the old lead or pay channel, and will undoubtedly take out big pay again as the early owners of the mine did when they worked the front, and from three to four acres of ground extracted nearly $250,000.

Plumas.

HALLSTED MINE.—Plumas *National*, July 3: The news from Rich gulch is good, and gives promise that the Hallsted mine will soon be on the boards as one of the very best in the country. The workings recently developed a very rich vein, of which extravagant reports come to us, some of them putting the rock at almost fabulous figures. There is no doubt, however, that the boys have got on the right track, and will make money rapidly. They are running one arastra, and will soon have another at work. We hope to go down that way in a short time.

BIG GOLD AND PLENTY OF IT.—A big strike has been made in Mr. F. B. Whiting's French Ravine claim, on the East Branch. The Company have prosecuted the prospect work there for some time with but little success, and some of the stockholders had become discouraged, but the news had a wonderfully bracing effect, and French Ravine shares are now at a high figure. The rich pay rock is in a small vein, running parallel with the main ledge, and is literally studded with gold, many of the pieces being magnificent. Some two or three tons of very rich rock are now on the dump-pile, and more is being added to it daily. The opening in the vein is now ten ft in length, and the one extending into the mountain grows richer as the tunnel progresses, while the other end holds fully as good as at first. This proves that it is not a "pocket," but simply a very rich vein, and it is hard to tell how much will be realized from it. The rock will certainly yield hundreds of dollars to the ton, and it looks as though a big bonanza would be the result to the stockholders. Mr. Whiting has persevered in the working of this ledge for several years past, and he certainly deserves the rich pay which he is now finding. He is down at the mine at present, and will attend to it very closely from this time on.

San Bernardino.

RED JACKET.—Calico *Print*, July 5: This mine has recently been leased for two years by A. Barber, who has been engaged in mining matters in Calico for the last two years. His confidence in the camp has increased to such a degree that he has gone to work in earnest to develop this promising piece of property, and, fortified with his experience in this remarkable camp as well as in other districts, he is prepared to design plans of operations, and execute them with such a degree of accuracy as to make success almost a matter of certainty. Enough ore has already been extracted to pay for the present expenditures and leave a margin—a margin that will become a handsome daily dividend when the mine is developed to such a degree as to warrant the erection of a quartz mill. Seventy tons of ore are on the dump that will mill $80 to the ton, and when the quantity reaches 100 tons it will be reduced to bullion. Seven men are employed in developing the mine. Near the east end of the Burning Moscow a tunnel has been driven in 100 feet within 100 feet of the north line of the King, on a line with the fourth level of the latter, with which it will connect and he used as an important thoroughfare between the two mines. This tunnel will strike the foot of the ledge when it is extended about twenty feet further, and will cut the vein about 180 feet below the apex of the croppings. A tunnel has also been started below the lower works on the Mammoth, and will cut the vein 75 feet lower than any opening that has been made on the Red Jacket on the south. The Red Jacket is very favorably located in a mineral belt that will prove to be an extensive and profitable field of operations, judging from the successful progress of its neighbor, the King, which is turning out every day bars of bullion.

LAVA BEDS.—The mines in operation at the Lava Beds are looking well. The Meteor and Mammoth Chief have virtually closed down until the warm weather is over, there being but two men left in charge. These mines have been operating in ore, a considerable body of low grade ore being uncovered and small quantities of high grade ore taken out. The indications of these mines developing into first-class property are good. The Morning Star company have eight men at work. The face of the tunnel is in good ore, and the indications are that a considerable body of fine ore is being opened. Ten carloads were recently shipped from the several mines in operation in this locality to Osborne's mill at Melrose, Alameda county, the returns from which will determine the extent of future operations in this new camp. Although this camp is slow it is sure and certain to build up on its own merits. All interested parties entertain the strongest hopes that it will eventually become a flourishing camp.

IMPROVEMENTS AT CALICO.—Cor. San Bernardino *Index*: One of the grandest schemes that has ever been talked of in Calico is now in contemplation by the King Mining Company. They have in view the construction of a reservoir on top of the little hill to the left of the road leading to Calico. They will have pipes running to it from Bob McChristian's well on the dry lake, about a mile below the reservoir, and the water will he forced up to it by steam pumps. From here the water will be piped to the foot of the King mine. Pipes will then be laid to all the business houses of town, which will obviate the necessity of hauling water to the camp. This is a grand scheme and should be carried into execution by all means. For the past two years the town has been paying three cents per gallon for all the water it has used, and if this scheme is carried into effect will then be much cheaper.

Sierra.

A RICH STRIKE.—Sierra *Tribune*, July 4: John Fessler recently located a ledge near Alleghany that has caused considerable excitement in that vicinity. The claim is located higher up the mountain and east of the Bullion mine, on Kanaka creek. The vein crops out on the surface for quite a distance, and in one place 15 ft wide. Where Mr. Fessler has sunk seven ft and obtained some very rich ore, the ledge is three or four ft wide. During the first quartz mining excitement around Alleghany a Spaniard discovered what is now supposed to have been this ledge, and sunk a shaft some 15 ft on it. The fine specimens he exhibited caused quite a furor among the early pioneers, and many efforts were made after the Spaniard left to find where he worked. The ledge taken by Fessler has been traveled over for many years, but no one ever supposed it contained gold, and consequently nobody has taken the trouble to locate it. Since Fessler has located the ledge and found very rich specimen quartz right on the surface, many people around Alleghany now believe that this is where the Spaniard obtained his big prospect in early days. The owner of the ledge was in Downieville last week and stated to the writer that he thought this ledge and that of the Hope mine over on the Minnesota side, were one and the same vein. If this should turn out to be true there is an excellent opportunity for some company of means to open up a big mine. The ledge could be worked to a great depth by running a tunnel from Kanaka creek, and at the same time water could be obtained from that stream for all milling purposes.

HOG CANYON.—*Mountain Messenger*, July 5: P. A. Lamping was down from Hog Canyon Sunday, and informs us that he struck the old works in the Good Hope ledge, from which the workmen were closed out years ago by a cave. The part of the old work tapped by this new tunnel which goes in on a level with the mill is an upraise from the 200 foot level. In a drift the workmen found the tools left by Bob Jones—wheelbarrow, picks, shovels, etc. Mr. Lamping knew of this unworked part of the ledge, and has been running for it from the start, but did not expect to be lucky enough to strike it without some search. The rock taken from this raise by Jones was the best ever found in the mine, several runs being made from it, averaging about $10,000 each. Some very fair rock was encountered before reaching the raise, all of which has been carefully culled and saved. He hopes to be able to start the mill in a week or two, and knows of rock enough to make several good runs.

Siskiyou.

PICK AND PAN.—Yreka *Union*, July 3: Mr. John H. Woods of Rocky Bar on Klamath river says that all the machinery has been erected in the claim in which he is interested and that work will commence at once. The company at Oregon Bar, just above his claim is also ready for work and has probably started by this time, all the machinery being in working order. Mr. William McConnell was in the city Tuesday and says that the electric light was thoroughly tested in his claim on the Klamath river last Monday night and proved entirely satisfactory. The surface dirt in the McConnell claim is paying unusually well and when the bedrock is worked it will no doubt prove to be extraordinarily rich. Mr. C. H. Pyle has purchased the ten stamp mill formerly used at the "Eliza" mine on Deadwood. The mill will be taken down and removed to Yreka, but in all probability will be put up at the Humming Bird mine on Deadwood this fall. Its removal here is to prevent its destruction by forest fires. Mr. Charles Junker visited the Empire quartz mine at Klamath river last Sunday and reports the ledge to be very rich for a distance of 40 ft. The ledge is five and a half ft wide and the full body is being followed to test its permanency. As tunneling progresses the rock changes somewhat in appearance but the prospect remains the same. Over a thousand tons of rock is now in sight, and the richness of it will justify the owners in making any needed outlay for further development.

Trinity.

DEADWOOD AND VICINITY.—*Journal*, July 4: In company with Dr. S. L. Blake and J. W. Philbrook, we paid a visit to the Brunswick Mine, on the French gulch side of the mountain, last Saturday, and found everything looking well and work progressing satisfactorily. Parties conversant with the property say it is a $20,000 mine. On the road through Deadwood and at Lewiston we heard of general prosperity at the various mines, but gathered no special information regarding any of them. McDonald & Franck have their new five-stamp mill on the ground and will soon have it erected and in operation on ore from their Barted mine which is very rich. R. N. Davidson has his Cannon Ball mill in operation and it is said to work well—Lambeth's mill is running on Brown Bear rock and the sulphuret reduction works are in operation. Generally speaking the district is prosperous as usual.

Tuolumne.

MINING IN TABLE MOUNTAIN.—Tuolumne *Independent*, July 3: A few days ago we visited the "Branch" Saratoga mine, owned and operated by W. H. Harding and N. Fales, of Springfield, and B. Keith, of Columbia. This mine is located on Table mountain and adjoining the J. Richards' claim in Springfield, and was originally located under the name of Saratoga, simply. We call attention to this mine, at this particular time, in substantiation of prior statements we have made relative to the vast undeveloped wealth of the ancient river channels traversing the county. The operations of the present Co. has been carried on through the old works and have just reached a part of the unexplored channel (virgin ground) which is developing immensely rich in auriferous gravel. Thus we see no reason why the miles of unbroached river channels in Table mountain, in many places, are not as rich as some parts of the channel proved that was mined years ago. The outlook of this mine, so far as opened out, is most promising indeed; from which, it may be safely said, the Co. will he richly rewarded for their perseverance and for the enterprising spirit manifested in the prosecution of the work necessitating the practical development of the mine.

GOOD QUARTZ.—*Union Democrat*, July 5: In the Lamphier shaft, at a depth of 340 ft, there is a large strong vein of good quartz. The runs at the mill continue to be of a most satisfactory character. It will be necessary to close down the mill for a while until a new engine can he procured, the old one in use having become incapacitated for doing the work. When the new engine is put in, the crushing capacity of the mill will probably be increased by the addition of another five-stamp battery. J. A. Davis and John Skae, who recently purchased the Dead Horse mine at Summersville, are pushing ahead rapidly with the work of development. A vein of good milling quartz has been struck in the shaft, but the extent of the chute cannot be determined until levels have been opened and drifts run.

NEVADA.

Washoe District.

CHOLLAR.—*Enterprise*, July 4: The Cornish pumps at the 2900 were completed, all connections made and the entire system set in motion at 1:30 P. M. Friday, June 27th. The bulkhead in the Cholar south drift on the 2600 is being rapidly constructed, and the main lateral drift south at the 2800 has been cleaned out. The work of drifting at this point was resumed last Tuesday. No crosscutting to the ledge will be done until the south lateral is driven ahead 200 or 300 ft beyond the present point.

HALE AND NORCROSS.—Work has not yet been resumed on the 2800 level and probably will not be

until after the bulkhead on the 2600 level of the Cholla is completed. Owing to the Superintendent of the Mexican mill, Evan Williams, having been injured by a fall the full returns from that mill have not yet been received. Over 1,000 tons of ore have been sent to the Eureka mill, and the shipments continue to be 500 to 600 tons per day.

POTOSI.—Last Tuesday the work of drifting was resumed in the main lateral drift on the 2800 level toward the ground of the company. On Friday, June 27th, the Cornish pumps at the 2900 level were connected with the hydraulic system of the levels above, and all the pumping apparatus is now working very satisfactorily.

SIERRA NEVADA.—The work of putting in column at the hydraulic pump in the joint Union Consolidated winze is completed. The diamond drill, which has been put into the north drift on the 3100 level is showing quite a flow of water. The drill was put into west crosscut No. 3, and has been extended over 160 ft.

ATTILA CON.—The north lateral drift is out about 450 ft. It is being advanced at the rate of 80 ft per week. It is still running along a smooth clay wall with low-grade quartz, yielding no assays on the west side.

MEXICAN.—At the 3200 level have completed the pump tank, placed in position a donkey pump and resumed sinking. During the week the winze will be deepened six or seven ft. The material at the bottom blasts badly. This work is being done jointly by the Mexican, Sierra Nevada and Union Consolidated companies.

GOULD AND CURRY.—At the old sixth station (825 level) of the Bonner shaft a drift will soon be started that will explore a large amount of virgin ground at and above that point.

BEST AND BELCHER.—Good progress is being made in the joint Gould and Curry west drift on the 2500 level. Work is also in progress in the east drift on the Consolidated Virginia line on the 1200 level, where some very promising material is being encountered.

YELLOW JACKET.—Sufficient ore is being extracted to keep the Brunswick mill, on the Carson river, in constant operation. The exploring drifts are finding a considerable amount of ore that will pay for milling.

OPHIR.—Are cutting out a station at the 560 level in the main shaft, from which a drift will be run west under all the old workings in order to drain and ventilate them.

ALTA.—The east drift on the 2150 level is still in comparatively dry ground and is making fair progress. The diamond drill is being run west and drifting in that direction will soon be resumed.

CROWN POINT.—About the usual amount of ore is being extracted and sent to the mills. A considerable amount of ore that will pay for working is being opened up by the prospecting drifts.

SAVAGE.—All is now in such shape that prospecting may be resumed whenever the officers of the company shall decide to begin operations at any point on the levels now opened.

CON. VIRGINIA.—The east drift on the 2000 level is being advanced at the rate of about 30 feet per week. It is passing through vein material of a promising appearance.

UTAH.—The main south drift on the 1950 level is still in a promising formation largely composed of quartz. There is no trouble with water.

ANDES.—Some paying ore continues to be found, and the exploring drifts show a good deal of quartz that looks well and promises to carry ore.

SCORPION.—Work is progressing as usual in the main west drift on the 500 level. The rock remains about the same as heretofore noted.

BELCHER.—The usual amount of ore is being extracted, and the prospecting drifts are finding some good material.

SUTRO TUNNEL.—Following is the report of progress and details of work in the Sutro tunnel from June 1st to 30th, inclusive: Main Tunnel—During the month the repairmen have placed on the drain boxes, west of point 12,500, 500 new covers and 12 sides of 3x12x20 plank, and east of point 12,100, 600 new covers and 15 sides; also, repaired the track and placed guard plank on both sides of the same, between points 12,900 and 13,200, and at other points along the line of the tunnel. South Lateral—Sub-drain cleaned out south and near the Yellow Jacket shaft, and 1,500 ft of guard plank replaced that had been removed to clean out the drain. Retimbered ground north of point 6,300 for a distance of 53 ft 3 inches, and south 27 ft 7 inches, and between points 2,500 and 2,700 removed 62 posts and 26 caps of old timber, squared the ground, cleaned up the debris and put in place 53 posts and 25 caps of new timber; also, lagged and braced the same.

Columbus District.

MOUNT-DIABLO.—Candelaria *True Fissure*, July 5: The west drift from winze No. 5 is in 81 ft, and still shows small spots of ore of good grade. The east drift from the north crosscut, west of the shaft on the third level, is in 39 ft, and shows but little of value. The west intermediate, between the second and third levels, is in 96 ft, and shows some low-grade ore, but the ledge is more broken. The west drift from the raise connecting the second and third levels is in 22 ft, and shows some $40 quartz. A drift has been started from the south crosscut, east of the shaft, on the second level, and shows a little ore of good grade. The east drift from the north crosscut on the second level, is in 119 ft, and shows a small streak of $70 ore. In the intermediate, between the first and second levels, the west drift is in 71 ft, and shows some $40 quartz. In the drift from the north crosscut, west of the shaft on the first level, there is a little good ore, and in the same part of the mine a west drift on some $70 quartz looks promising. The incline has been sunk 15 ft during the week, and is now 182 ft below the third level. A chute has been put in at the fourth level, and work will be resumed on this level as soon as the waste stored there has been hoisted.

MAKING BORAX.—The present warm spell is the opening of the harvest among the people engaged in borax mining south of here. Cross & Trudo are about starting up their new works, and, it is learned, the Pacific Borax Works have been leased and will soon be in active operation. In addition there are several small ones, and all of them running to their fullest capacity. There are over sixty men at work near Columbus and south of there, who, it is estimated, will produce from seventy to one hundred tons of the mineral per month for the next three months.

Comet District.

HIGH GRADE ORE.—Piute *Record*, July 1: Willet and Clark shipped in several tons of high grade ore during the week from Comet District to Poujades. Jim Burrows, in that district, is now extracting rich ore from one of his locations. The ore is found between the slate and lime.

Tuscarora District.

CENTRAL CON.—*Times-Review*, July 3: Have started south crosscut, 150 level. Progress for the week, 28 ft.

ARGENTA.—South crosscut on the 400 level is in 164 ft. Rock continues very hard.

INDEPENDENCE.—The usual progress has been made with the work on the 300 level. On the 400 level the drift west has been extended seven ft, and the drift east eight ft. There is no material improvement to note.

GRAND PRIZE.—South drift in the 200 level is in 123 ft; progress for the week 31 ft. South drift, 300 level is in 370 ft. Upraise above the 400 is up 82 ft; progress for the week 600 ft. Stopes above the 500 producing some fair ore.

BELLE ISLE.—East crosscut, 450 level, has been advanced 8 ft; total length 152 ft. Connection will be made in a few days at this point with the winze that has been sunk on the "west" vein from the 350 level. Joint Belle Isle and Navajo upraise on the "east" vein, 250 level, has been carried up a total distance of 23 ft. Have started a joint crosscut on the 150 level to the "east" vein.

NORTH BELLE ISLE.—No. 2 crosscut, 350 level, has been extended a total distance of 100 ft. A vein has been cut at this point, that shows good ore. The crosscut will be continued to another vein that lies beyond. Drift north, on the 70 level, has been advanced seven ft. The face of the drift still follows the small feeders of rich ore.

NAVAJO.—The development work on the "east" vein is in good ore at all points. The Joint Belle Isle and Navajo line upraise east vein 250 level, has been carried up a total distance of 23 ft. South drift from No. 1 crosscut, same vein and level, extended 13 ft, No. 1 upraise, 15 ft south of No 1 crosscut is up 58 ft. To connect with this upraise; winze from No. 1 crosscut, 150 level has been sunk a total distance of 35 ft. The usual amount of work has been forwarded in the old workings and the usual supply of ore has been extracted.

ARIZONA.

HUMBUG.—Cor. Phœnix *Herald*, July 3: From Mr. Woodworth I learned that Turkey creek has quite a mining boom. No large mining enterprises are found south of Prescott, but aggregate developments are now more extensive than ever before and are being prosecuted systematically, the ore being shipped to Pueblo, Colorado, for reduction. Arastraing is becoming an extensive industry in the south half of the county, including the top of Delpasco mountain. Milling is certainly looking up. The Groom Creek has made a successful run and is preparing for another. The Senator mill is being removed to Lynx creek. Two mills are being erected on Turkey creek. The Tuscumbia mill is running on ore from the Lane mine. The Basin mill has been leased by Joe Millner and Bob Cartnell, two engineers and practical mill men. This mill has been a political machine and it will be hard to reinstate it in the confidence of the miners. The Basin mill is surrounded with good ore and need not lie idle a day. The Lane mine is generally regarded as the best silver mine in Yavapai county. Messrs. Hayden, Brittenhans and Boner developed their property, originally known as the Lorennia mine, with a persistency that should be imitated, and certainly they are entitled to the reward now in sight. When they started in to develop the prospect in the fall of 1879, they had no means to start with and but few tools. They went to work for wages and then got themselves an outfit, and from that time to the present they have worked for wages and worked on their mine, but always made it a point to work and keep out of debt. They have sold about $1,200 worth of ore, a very few tons, and with this and their wages, they have sunk two shafts, about ninety ft each, one of them on the ledge and the other a perpendicular shaft off to one side of the lead, and have run about 130 ft of drift along the lead and took out and assorted about 400 tons of ore that is now piled up at the mine. They calculate they have about 800 tons more to stope. Mr. Hayden was imperative in his demand that the mine should not be over-rated. He thinks the ore will work about $100 a ton. They have made a proposition to lease the Tiger mill and work their own ore, after which they will erect hoisting works and explore their mine in depth.

CONCENTRATORS.—Phœnix *Herald*, July 3: Six large concentrators have been built at Wickenburg to work the tailings from the Vulture mine. The Benson company use these concentrators at their reduction works. A large pump is en route for Wickenburg and will be erected as as soon as possible. R. E. Farrington & Co. are handling considerable ore for the chlorides in the vicinity of Gillett. Small quantities are received and held until sufficient quantities accumulate to make a carload, in order to reduce freights. This is of much importance to miners in the vicinity of Tiptop, who have been quite successful this year. We learn that the Golden Fleece mill will do custom work, in lots of 100 tons, for $10 per ton. By this means miners can develop their properties, support themselves, and at the some time prove whether their mines are worth the expense of mills, etc. Custom mills are of much benefit to poor miners.

COLORADO.

NOTES.—Georgetown *Courier*, July 3: The Georgetown Public Ore Market is doing a rushing business, and is treating a large amount of ore. The Miners' Sampling Works, of this city, treated and shipped 250 tons of ore for the month of June. The German Friend mine, situated in the West Argentine, near the Baker is to be started up immediately under the management of F. H. Burger and Albert Hundchen. The West Rogers is being worked by Rube Mersenau & Co. They are at present drifting on the vein. It is their intention, however, to begin sinking at once. The work of development goes steadily on at the Buckeye State mine under Omer Sheppard. The East Rogers on Democrat mountain is in better shape now than ever before. The McVeaty lease, is turning out some excellent mineral. Stoping and drifting goes on uninterrupted and with flattering results. A contract for 60 ft on the Bonanza tunnel has been let to Hugh Thomas. The tunnel is now 800 ft in length and will soon intersect the White Pine lode, when a large body of mineral is expected to be encountered. Joe Powers & Co. are drifting ahead on the west extension of the Polar Star. The prospect looks well. G. H. Gilbertson still continues to push work on his Kongbergs lode. The ore streak improves as the work of development goes ahead. A party of lessees are drifting ahead on the 2d level of the Silver Cloud. They are now 1,400 ft from the surface and will within 100 ft cut the Matilda Fletcher vein. A marked improvement is noticeable in the appearance of the Blue Grass vein. The mine has been equipped with a new car and track. There is said to be over 300 ft of water in the Terrible shaft. A force of 20 men are engaged in opening up the Tishomingo lode on Brown mountain. A fine streak of 600 ounce mineral has been encountered.

MONTANA.

PLACER MINING.—*Inter-Mountain*, July 6: The placer mines, which first attracted the attention of miners to this district and which in the sixties were supposed to be its only source of wealth, still contribute a liberal quota to the output of the camp and have been in continuous operation every season since the first discoveries. Mr. A. W. Barnard who came here in '68, and who has since acquired a good deal of valuable quartz property still stays with the placers. He is working a force of seven men, and from the excellent "prospects" he obtains, has evidently struck a richer piece of ground this season than any he has worked for many years. The length of the season here during which enough water is available for placer mining averages 90 days. During the past ten years the gold product of the Barnard claim has been over $100,000. This year the yield promises to be not less than $12,000. The claim embraces enough ground not yet worked to last six years, during which time it is good for from $60,000 to $75,000.

THE GRANITE MOUNTAIN.—The Granite Mountain, which is justly entitled to the distinction of being considered the richest silver mine in Montana and which in one brief year has placed half a dozen men in affluent circumstances, is being developed with an energy born of its recently ascertained wealth, and a well founded confidence in its future. Operations are now conducted in three tunnel levels, the lower one being 1,200 ft into the hill and its face about 400 ft from the surface. The first-class ore body which has been followed in level No. 3 for several hundred ft without a break or a pinch, varies in width from four to five ft and according to the most cold blooded samples assay 200 ounces per ton. Considering its width and length it is by far the richest silver ore body ever opened in the territory, and when stoping shall begin the output in dollars will far exceed that of any other silver property in the west. The erection of a 20-stamp mill has already been contracted for with the well known firm of Frazer & Chalmers, who have sent out Mr. Angus McKay, a thorough mechanical engineer, specially to superintend its construction. When completed it will be the finest structure of its size in the territory in the point of solidity, durability and capacity, and will be of material assistance in bringing Philipsburg to the front as a bullion producer.

BUTTE'S PRODUCTION.—It is a fact that very few people in this district and none outside of it seem fully to appreciate the enormous and continued productiveness of the mines of Butte. They have a general impression that some big mines are in the vicinity, but seldom take the trouble to reflect upon or investigate the results of the operation. On an average during the past three months forty carloads, containing in the aggregate 400 tons of ore and matter, have daily left the Butte depot. Of this amount, at least, 100 tons is matte. Estimating the ore from which the matte is produced to contain 20 per cent copper, the matte thus represents 500 tons of ore, which added to the crude ore shipments (about 300 tons), makes 800 tons from the smelters and copper mines alone, leaving out of consideration the low grade concentrating ore which is left on the dumps for future treatment. The silver mills of Butte are all in operation, working their full complement of stamps and are daily reducing ore as follows: Alice, 90 tons; Lexington, 50 tons; Silver Bow, 30 tons; Moulton, 45 tons, Dexter, 28 tons; Old Lexington, 10 tons, total 253 tons. If thus appears that the total amount of copper and silver ore raised from the mines of Butte every 24 hours and either reduced here or shipped away for treatment aggregates 1,053 tons. This daily production places Butte first among the great mining camps of the country. Leadville, it is true, produces a greater tonnage, yet the value of its output is less than that of Butte. At the present rate of production this camp will produce during the current year more money than any other camp in the world. If the Anaconda smelter should start up in September, as it is likely to, Butte will not finish at the lead, but it will distance all competitors in the contest.

NEW MEXICO

GENERAL NOTES.—Silver City *Enterprise*, July 3: The Pinos Altos Gold and Silver Mining Company started their mill yesterday to run permanently, having previously tested it. The mill is one of the most complete and perfect in the territory. The Montezuma mine, at Cook's Peak, has not been leased to the owners of the Deming smelter, as reported. The proposition of the smelter of thirty-five cents per unit for lead and $12 per ton for treating the ore was not accepted by Messrs. Crawford, Miller & Higbee, the owners of the property. The names of forty-nine men were on the pay roll of the Old Man mining company at Fleming, on Saturday night last. On Monday the force was increased and at the present time, including the men engaged in hauling ore, must number in the neighborhood of seventy-five. The men are not required to work on Sundays. Carroll brothers' Silver Cave mine, in the Florida mountains, near Deming, is steadily swelling Grant county's output for this year, and making a fine record for itself as a producer. Weekly shipments of ore are being made to Kansas City and Pueblo, and the returns are reported as being very large. Another wagon train laden with concentrates from the Cooney mine, at Alma, arrived in town on Tuesday. Three cars of concentrates and high-grade ore have been shipped from this property within the past three weeks, and are delayed by washouts between Albuquerque and this point. The mine will make a splendid showing for the present year. Since the new order of things at the Old Man mine, 32 tons of ore that will average 200 ounces have been sacked and shipped. A great portion of the low-grade ore is being piled on the dumps and reserved for the contemplated mill to be erected at Fleming this fall. Developments thus far have been very satisfactory, and ore of good grade is in every opening. The Hancock mine, in Tres Hermanas district, owned by Meredith & Allman, of this city, has been leased to a man named Connolly, with the understanding that he must have a thirty-ton concentrating plant upon the ground within one month, and Connolly, after letting contracts for the development of the mine, departed for Denver to purchase the necessary machinery for such a plant. During Mr. Connolly's absence a fine body of ore was struck in a new place on the claim. Our informant states that it is the biggest thing yet uncovered in Southern New Mexico, running many thousand dollars in silver, and it is to be hoped the report is true.

OREGON

MINING NEWS.—Jacksonville *Times*, July 3: Considerable prospecting is going on. Miners will soon commence getting ready for another season. Wimer & Sons, of Waldo, are still piping, but will soon commence cleaning up. Bybee & Newman are getting their claim near Waldo in shape for next season's work. The Sterling company has quit piping and is now engaged in cleaning bedrock. A good report is promised. Simmons, Ennis & Co. have suspended active operations on their mammoth enterprise near Waldo, owing to the scarcity of water. The hydraulic mines of McCall and Anderson, located this side of the Eagle mills, are still being worked on full time. A. G. Rockfellow is in charge. The Steamboat mines are turning out fairly and in another season we may expect something interesting from them, as several parties are engaged in opening them. A San Francisco company has secured a large area of mining ground in the Althouse district, Josephine county, and will soon commence the construction of a large ditch to bring water on it. Desselles & Co., of Scotch gulch, Josephine county, will soon commence making a final clean-up for the season, as water is failing. This is one of the best mines in Southern Oregon and will make a good report. Mr. Graham, who is engaged in mining in the Beaver Creek district, was in town Wednesday. He informs us that the mines there are turning out well. Among the gold he brought over was a nugget worth nearly $14. John Hall and Wm. Bybee have inaugurated a mining enterprise on Canyon creek, Josephine county, which they have great faith in. The ditch that will be necessary is only a few miles long, and operations will be begun on it at once.

A RICH DISCOVERY.—*Oregonian*: A few days ago an assayer of this city received several specimens of rock from Andy Wyland, of Clackamas county, which showed unmistakable signs of being both silver and gold bearing in considerable quantities. The assay was made with the following results: Per ton, silver, $235.10; gold, $25.01; total, $260.11. Wyland says that four men were at work on the mine from which these specimens were taken for ten days in the first part of June, making preliminary developments. A width of twenty feet has been uncovered, and a cut of forty feet made parallel with the ledge, on a dead level. Neither side-wall has been found, and the ledge has been traced for a distance of four miles. Free gold is plentiful in the rock, which is blue-whitish quartz full of pyrites and sulphides of iron, covered with chloride of gold. This chloride has not yet been assayed. The discoverer says that he has been hunting five years for this thing, and it "is the finest ledge he ever saw." As he is an experienced miner, this means much. He states that a capitalist of this city offered him $20,000—$2,000 down, and $18,000 in bonds—for the mine, but he refused the offer. The locality of this new discovery is in the Cascade mountains, about eight miles due south of Table rock, on a tributary of the south fork of a stream known as Henry creek, which makes into the main fork of the Molalla, one mile above Ogle creek. The road thither from Wyland's home in the foothills, which is in section 15, township 7 south, range 3 east, is a rude winding trail. The discovery promises to be the means of starting a mining boom in Clackamas county.

UTAH.

REVIEW.—Salt Lake *Tribune*, July 4: The receipts of bullion (excluding ore) in Salt Lake City for the six months ending June 30th, inclusive, aggregated as follows: January, $449,228.74; February, $364,606.47; March, $460,366.60; April, $432,809.44; May, $343,416.15; June, $539,532.90. Total, $2,389,960.30. The receipts of bullion and ore in this city for the weeks ending July 2d, inclusive, amounted to $109,002.93 of bullion, and $5,500 of ore; aggregate, $114,502.93. For the previous week the receipts were $116,888.96 of bullion, and $4,850 ore. The receipts of Horn Silver bullion for the week were eighteen cars, valued at $54,000; total output for six months, $1,136,000; total to date, $1,151,000. Sales of Horn Silver stock in New York for the past week, 1,120 shares, at these prices, viz.: June 24th, $5.25; June 25th, $5.25@$5.50; June 26th, $5.25@$5.38. The output of the Ontario for the week was fifty-two bars, assaying $37,102.93. Total product for six months of this year, $787,047.98; to date from January 1, 1884, $797,632.29. No sales of this stock are reported for the week in New York. The Crescent sent down one lot of ore, $2,200. The Stormont sent up two bars of silver, $3,650. The product of the Hanauer for the week was seven cars of bullion, $14,250. The hot season has come on in earnest, and the snow is rapidly disappearing from the hills.

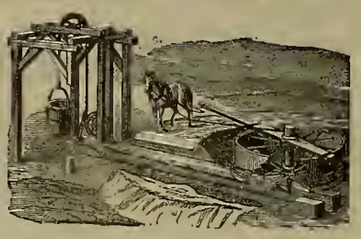
MINERS' HORSE WHIM.



ONE HORSE CAN EASILY HOIST OVER 1,000 LBS. at a depth of 500 feet. The Whim is mainly built of wrought iron. The hoisting-drum is thrown out of geae by the lever, while the load is held in place with a brake by the man tending the bucket. The standard of the whim is bolted to bed-timbers, thus avoiding all framework. When required, these whims are made in sections to pack on mules.

120 in Actual Use.

CHICAGO **FRASER & CHALMERS.** ILLINOIS

MANUFACTURERS OF IMPROVED AND APPROVED FORMS OF

MILL AND MINE MACHINERY.

Having made extensive additions to our Shops and Machinery, we have now the LARGEST and BEST APPOINTED SHOPS in the West. We are prepared to build from the Latest and Most Approved Patterns,

QUARTZ MILLS

For working gold and silver ores by wet or dry crushing. The Stetefeldt, Howell's Improved White, Brunton's & Bruckner Furnaces, for working base ores. Rotary Dryers, Stetefeldt Improved Dry Kiln Furnaces.

SMELTING FURNACES,

Water Jackets, either Wrought or cast iron, made in sections or one piece, either round, oblong, oval or square. Our patterns most extensive in use. SPECIAL FURNACES FOR COPPER SMELTING. Slag Pots and Cars, Improved form. Bullion and Copper Moulds and Ladles, Litharge Cars and Pots, Cupel Furnaces and Cars.

HOISTING ENGINES Large or Small for flat or round rope. Double Cylinder Engines, from 6x10 to 18x60. This latter size furnished J. B. Haggin or Olant and Old Abe Co., Black Hills also Corliss Pumping Engines, 20x60, for Hoisting and Pumping Works, for 2,000 feet deep. **Baby Hoists for Prospecting, 4 H. P. to 6 H. P.**

Wire Rope, Safety Cages and any Size and Forms of Cars.

Principal Office and Works, Fulton and Union Sts., Chicago, Illinois.

Frue Ore Concentrator, or Vanner Mills.

Coarse Concentrating Works, Improved Jigs, Crushing Rollers, Sizers, Trommels, Rittenger Tables, and all other adjuncts for the proper working of Gold, Silver and Copper Ores, complete in every detail.

HALLIDIE IMPROVED ORE TRAMWAYS. We refer to Gen. Custer mine, Idaho, 5,000 feet long; Columbus Mine, Col., 4,750 feet long; Mary Murphy mine, Col., 5,000 feet long, all in constant operation.

LEACHING MILLS,

Improved Corliss and Plain Slide Valve Meyer's Cut-off Engines.

CORLISS ENGINES from 12x36 Cylinders to 30x60. PLAIN SLIDE VALVES from 6x10 to 36x36. BOILERS of every form, made of Pine Iron Works C. H. No. 1 Flange Iron, or Otis Steel. Workmanship the most careful. All Rivets Hand Driven.

McCaskell's Patent Car Wheels and Axles—Best in Use.

Photo Relief and Wood Engraving

AMONG the late discoveries in the Economic Arts stands prominently that of Engraving by the Art of Photography. While the new methods and processes greatly lessen the cost of producing the special kinds of printing plates most suitably made by the aid of photography, one of the best results gained is the perfect accuracy that is obtained.

Improvements are being continually made through more experienced workmanship, and ingenious and wonderful inventions that are exceedingly interesting and useful.

Portraits of men and women are made remarkably perfect in likeness. The same of animals plants, flowers, fruits, vegetables, landscapes, buildings, etc.

Nearly all kinds of engravings for books, pamphlets, trade catalogues, circulars, cards, handbills, labels, certificates, and other varieties of printing, are made with great advantage and desirability.

Some kinds of illustrations can still best be done on wood, and will long continue t be so made, for various reasons. It is our purpose to use the best available methods for accomplishing economically the most satisfactory results, and work is therefore solicited for all kinds of engraving.

All Publishers, Printers, Societies, Schools, Companies, Scientists, Professional Men, Merchants, Stock-raisers, Horticulturists, Mechanics, Manufacturers, Tradesmen, and all others requiring Engravings, should call and inquire, or write particularly for any further information desired, to the OFFICE OF THIS PAPER.

On inquiring prices, send samples of work similar to that desired, when practicable, or otherwise give as clear an idea as possible of just what is wanted.

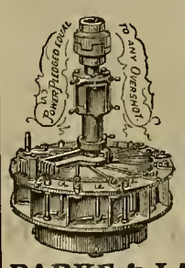
Satisfaction guaranteed on all orders.

JAS. LEFFEL'S TURBINE WATER WHEEL,

The "Old Reliable,"

With Important Improvements, making it the

MOST PERFECT TURBINE NOW IN USE.



Comprising the **Largest** and the **Smallest** Wheels, under both the **Highest** and **Lowest** head used in this country. Our new Illustrated Book sent free to those owning water power.

Those improving water power should not fail to write us for **New Prices,** before buying elsewhere. New Shops and New Machinery are provided for making this Wheel. Address

JAMES LEFFEL & CO.,

Springfield, Ohio, and 110 Liberty Street, New York City

PARKE & LACY. General Agents. **21 & 23 Fremont St., S. F.**

JENKINS PATENT VALVES.

Gate, Globe, Angle, Check and Safety.

Manufactured of BEST STEAM METAL. We claim the following advantages over all other Valves and Gauge Cocks now in use:

1. A perfectly tight Valve under any and all pressures of steam, oils or gases
2. Sand or grit of any kind will not injure the seat.
3. You do not have to take them off to repair them.
4. They can be repaired by any mechanic in a few minutes.
5. The elasticity of the Disc allows it to adapt itself to an imperfect surface.

In Valves having ground or metal seats, should sand or grit get upon the seat it is impossible to make them tight except by regrinding, which is expensive if done by hand, and if done by machine soon wears out the valve, and in most cases they have to be dis connected from the pipes, often costing more than a new valve. The JENKINS Disc used in these Valves is manufactured under our 1880 Patent, and will stand 200 lbs. steam. Sample orders solicited. To avoid imposition, see that Valves are stamped "Jenkins Bros." For sale by

DUNHAM, CARRIGAN & CO., San Francisco, Cal.

Mining and Scientific Press.

THE MINING AND SCIENTIFIC PRESS is the leading mining journal in America, and enjoys a larger circulation among the more intelligent operators and workers in the gold fields of the world.

Established in 1860, it has firmly maintained its position as a reliable, progressive journal. The information given in its columns has saved millions of dollars to the practical miners, metallurgists, mill men, mine and share holders on the Western side of our continent.

Among its contributors are the ablest and most experienced mining engineers, superintendents and practical miners in this country.

The PRESS gives a condensed summary of Mining News from the most important mining districts of the country.

New processes and methods of mining are described in its weekly issues. New mining machinery and improvements are frequently illustrated and explained in a manner to be of great value to all interested in mining.

As a scientific and mechanical representative of the Pacific Coast it is decidedly popular, and a standard journal with the most thrifty industrial people of the Pacific States and Territories. Its authority is of the highest order, and its usefulness in its special sphere unrivalled.

Every public library, mining engineer, metallurgist, mining operator, and intelligent mechanic and manufacturer, will find profit by its reading.

Subscription, $3 a year in advance. Sample copies, prepaid, 10 cents.

DEWEY & CO., Publishers.

No. 252 Market St., San Francisco, Cal.

Mining Share Market.

The stock market has been quite active this week, and a small sized boom has surprised and pleased the operators. The movement seems in the direction of the middle Comstocks, Chollar, Hale, Norcross and Savage have gone up as our tables show, and some others have followed them. There was some talk of Alonzo Hayward trying to get control of Hale & Norcross, but he denies the rumor. Some sort of pool has evidently been formed to force stocks, but the source is unknown to the general public. All is progressing well at the north end mines. They are now in good shape to push the deep winze. The pump tank at the 3200 level has been completed and a donkey pump put in. Since doing this work they have resumed sinking the winze. All being now in shape sinking will progress as rapidly as possible, but the rock (a species of barren, bastard quartz) blasts very badly. It blows out in pot-holes. Good prospects are being obtained in the Jones lease of the California and Consolidated Virginia ground, and very promising material is being found in the exploring drifts of the Gould and Curry and Best and Belcher. In the Alpha and Exchequer mines they are now drifting along a vein of quartz that promises well, being a solid body with well-defined clay wall. All the leading mines of Gold Hill are shipping full amounts of ore, with plenty more in sight.

Bullion Shipments.

Horn Silver, July 1, $18,000; Ontario, 1, $10,359; Hanauer, 1, $4,000; Stormont, 1, $3,650; Horn Silver, 2, $9,000; Ontario, 2, $5,351; Horn Silver, 3, $6,000; Ontario, 3, $5,233; Hanauer, 4, $2,100; Nevada's ores, $750; Horn Silver, 4, $12,000; Ontario, 4, $4,160; Hanauer, 6, $6,500; Horn Silver, 6, $18,000; Ontario, 6, $9,880.

WATER IN STEAM.—Herr Stouple, of Lucerne, Switzerland, by adding fluorescine to the water of a boiler, which by calorimetric test enabled him to detect the presence of one half of one per cent of water carried mechanically out of the boiler by the steam, found that from 2.3 to 4 per cent was actually thus present in the steam. The deep green color of the water in the boiler was retained in it for weeks, and yet no trace of coloring could be detected in the water condensed in the steam cylinder, a proof that the water which gathers there is entirely due to condensation caused by the expansion of steam, and that very little water is actually mechanically carried away by the steam from the boilers.

THE schooner Alaska, which left here on a mining expedition to Alaska a year ago, is supposed to have been lost. A party of men had wintered at the mine, and had succeeded in getting out a considerable quantity of ore. The programme was for the schooner to run directly to her destination, and, after landing supplies and men, to take a cargo of ore on board and return at once to this city. The vessel has now been gone more than a year. She was seen by the Cutter Corwin last September, and is supposed to have sailed for this port shortly after.

THE Grant coal mine and the Youngglove mine, in Amador county, says the Ione Valley *Echo*, are doing a rushing business. The Grant mine is working 40 hands, and is shipping from 5 to 9 carloads daily. The Ione coal is meeting with favor in the cities, and is found to be the cheapest fuel that can be used in stationary engines or for heating purposes. There is an immense quantity of this coal from the Mokelumne river on the south to beyond the Amador county line on the north, and coal can be had for generations to come.

Secure the Reduced Rate.

After the first of April, 1884, we announced a reduction of the price of the MINING AND SCIENTIFIC PRESS from $4 to $3 a year to all who would settle up arrearages at old rates and pay *in advance* thereafter. There are some who have not yet taken advantage of this offer, and we would therefore urge all subscribers still in arrears to remit what is due us to this date, at the rate of $4 a year, and pay in advance for another term at the reduced rates for new subscriptions paid in advance.

Don't Wait to be Called On.

Our subscribers can do us an essential favor by sending their subscriptions to this office without delay. Please do not wait to be called on. We have actual need of all subscriptions due or over due. Prompt payment in advance alone will enable us to continue the publication of a first rate paper.

THE Bodie Consolidated paid a dividend of $1 per share, or a total of $76,933, this week. The whole number of shares in the capital stock is 100,000, but there are only 76,933 out.

THE metal workers are in convention at Chicago for the purpose of organizing a National Union. Shorter hours and better wages are there objects.

IMPORTANT additions are being continually made in Woodward's Gardens. The grotto walled with aquaria is constantly receiving accessions of new fish and other marine life. The number of sea lions is increased, and there is a better chance to study their actions. The pavilion has new varieties of performances. The floral department is replete and the wild animals in good vigor. A day at Woodward Gardens is a day well spent.

Scientific, Mining and Other Valuable Books.

PUBLISHED OR ISSUED, WHOLESALE AND RETAIL, BY DEWEY & CO., MINING AND SCIENTIFIC PRESS OFFICE, S. F.

BY GUIDO KUSTEL,

MINING ENGINEER AND METALLURGIST.

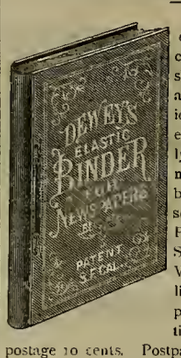
CONCENTRATION OF ORES (of all kinds), including the Chlorination Process for Gold-bearing Sulphurets, Arsenurets, and Gold and Silver Ores generally, with 120 Lithographic Diagrams. 1867.

This work is unequaled by any other published embracing the subjects treated. Its authority is highly esteemed and regarded by its readers; containing, as it does, much essential information to the Miner, Millman, Metallurgist, and other professional workers in ores and minerals, which cannot be found elsewhere in print. It also abounds throughout with facts and instructions rendered valuable by being clearly rendered together and in simple order. It contains 120 diagrams, illustrating machinery, etc., which alone are of the greatest value. PRICE, $7.50.

ROASTING OF GOLD AND SILVER ORES (Second Edition) and the Extraction of their Respective Metals without Quicksilver, 1880.

This rare book on the treatment of gold and silver ore without quicksilver, is liberally illustrated and crammed full of facts. It gives short and concise descriptions of various processes and apparatus employed in this country and in Europe, and the why and wherefore. It contains 156 pages, embracing illustrations of furnaces, supplements and working apparatus. It is a work of great merit, by an author whose reputation is unsurpassed in his specialty. PRICE, $3, coin, postage free.

An Easy Binder.



A. T. Dewey's patent elastic binder, for periodicals, music and other printed sheets, is the handiest, best and cheapest of all economical and practical file binders. Newspapers are quickly placed in it and held neatly, as in a cloth-bound book. It is durable, and so simple a child can use it. Price, (size of Mining and Scientific Press, Rural Press, Watchman, Fraternal Publishing Co.'s journals, Harper's Weekly, and Scientific American), 85 cents; postage 10 cents. Postpaid to subscribers of this paper, 50 cents. For sale at this office. Send for illustrated circular. Agents wanted.

COMPLIMENTARY SAMPLES OF THIS PAPER are occasionally sent to parties connected with the interests specially represented in its columns. Persons so receiving copies are requested to examine its contents, terms of subscription, and give it their own patronage, and, as far as practicable, aid in circulating the journal, and making its value more widely known to others, and extending its influence in the cause it faithfully serves. Subscription rate, $3 a year. Extra copies mailed for 10 cents, if ordered soon enough. Personal attention will be called to this (as well as other notices, at times), by turning a leaf.

Our Agents.

OUR FRIENDS can do much in aid of our paper and the cause of practical knowledge and science, by assisting Agents in their labors of canvassing, by lending their influence and encouraging favors. We intend to send none but worthy men.

Lost Papers.

If any subscriber fails to receive this paper promptly, after making due inquiries at the Postoffice, he is urgently requested to notify this office by *letter*, that we may send the missing papers, and, if possible, guard against further irregularities

PATENTS AND INVENTIONS.

List of U. S. Patents for Pacific Coast Inventors.

[From the official list of U. S. Patents in DEWEY & Co.'s SCIENTIFIC PRESS PATENT AGENCY, 252 Market St., S. F.]

FOR WEEK ENDING JULY 1, 1884.

301,204.—PAPER OR LETTER FILE.—Wm. B. Berry, Napa.

301,222.—SULPHUR RELINING APPARATUS.—F. Dickert, Salt Lake City.

301,304.—DREDGING MACHINE.—Wm. Harwood, Oakland.

301,251.—FLOUR BOLT CLEANER.—A. F. Mase, South Vallejo.

301,252.—ALARM LOCK.—A. F. McCollam, Fair Play.

301,254.—DRAG SAW.—McFarlin & Plum, Ono, Cal.

301,384.—AGRICULTURAL IMPLEMENT.—T. H. Meinhard, S. F.

301,149.—MIXED PAINT.—H. C. Petty, Vallejo, Cal.

301,285.—OYSTER CULTURE.—C. Schmitz, S. F.

301,396.—FURNITURE CASTER.—Scolley & Frick, S. F.

301,297.—PLOW.—C. B. Steane, Pleasanton.

15,118.—BADGE DESIGN.—C. H. Scanlan, S. F.

NOTE.—Copies of U. S. and Foreign Patents furnished by DEWEY & Co., in the shortest time possible (by telegraph or otherwise), at the lowest rates. All patent business for Pacific coast inventors transacted with perfect security and in the shortest possible time.

Notices of Recent Patents.

Among the pateuts recently obtained through Dewey & Co.'s SCIENTIFIC PRESS U. S. and Foreign Patent Agency, the following are worthy of special mention:

ALARM LOCK.—Alexander F. McCollam, Fair Play, Cal. No. 301,252. Dated July 1, 1884. This alarm lock consists, in connection with the reciprocating latch-shank and key of a lock, of a novel arrangement of spring strikers operated hy said shank and key, and of a gong inclosed by the lock casing, against which said strikers operate.

PAPER OR LETTER FILE.—Wm. B. Berry, Napa. No. 301,204. Dated July 1, 1884. This invention relates to a new and useful file for papers, letters, cards, sheet music, and other articles of similar nature which usually lie around in disorder, and are for that reason liable to be lost or injured. It consists of a series of peculiarly arranged spaced spring-brackets, or frames, adapted to he suspended from the wall, and having suitable words or characters indicative of, or referring to, the contents of the brackets.

DRAG SAW.—Wm. M. McFarlin and Chas. Plum, Ono, Shasta Co. The sawing machine consists in a peculiar self-supporting reversible frame, upon which are mounted two wheels, which, when the frame is upright, have the function of cranks for imparting motion, and when the frame is inverted have the function of rolling wheels for transporting the machine. With one of these wheels is connected a pitman, through which a reciprocating motion is imparted to a vertically adjustahle rod having the saw nttached. The arrangement of the different parts, the means hy which the inclination of the saw is varied, and the means hy which it is adapted to saw standing trees as well as logs, form part of the invention. This constitutes a simple and easily handled machine for use in the woods, adapted to saw up falleu trees or to saw down standing ones.

AUTOMATIC FLOUR-BOLT CLEANER.—Albert F. Mase, South Vallejo. No. 301,251. Dated July 1, 1884. This invention relates to that class of devices for cleaning tho rcels of flour-bolts, in which a brush is suspended over and its hristles come in contact with the exterior of the reel; and the invention consists of a novel arrangement and combination of devices. The rcels of flour-bolts are made polygonal, some having six, others eight and others nine or fewer sides, which are composed of fine silk stretched over ribs at the angles or wheel lines: for the pur pose nf preventing wear, ticking strips are secured. When the flour is at all damp, the most of the silk becomes clogged and it is necessary to keep it brushed to permit it to perform its functions. Various means are employed to accomplish this result, among which isan overhanging brush adapted to come in contact with the exterior surface of the silk. In some, the whole weight of the brush rests on the silk and soon wears it out, and in otherst he brush is set at an angle on the silk and nets as a wiper rather than a hrush, the difficulty in this heing that such a brush hecomes itself clogged up as its hristles are not exercised so as to frec themselves hy agitation. The ohject Mr. Mase has in view is to so suspend and connect the hrush that its weight shall at all times be removed from the silk, and yet be so moved that whatever way he the contour of the reel, its hristles shall come in light contact with the silk to hrush it and jump over the ribs to prevent wear of the ticking strips. The means for supporting the hrush, the mechanism for connecting it with the driving power to accomplish its action, the means for throwing it out of gear and the means for preventing undue wear of the gearing all form part of the inventor's patent.

PLOW.—Chas. B. Steane, Pleasanton, Alameda county. No. 301,297. Dated July 1, 1884. This is an improvement on that class of plows adapted for use in vinoyards and other places where rows are planted, where it is necessary to get near the plants or vines without injuring them. The invention consists in a peculiar pivoted beam adapted to be turned in a horizontal plane to an angle with the plow bottom and line of travel, in the peculiarly adjustable handles, and in the means of bracing or supporting them, and in the general counection and relation of the standard, beam and land-side. By bending down and pivoting the rear lower end of the beam the draft is strengthened and steadied, by applying it to both top and bottom of the plow. The standard is not in a vertical plane with the land-side, and consequently the beam is more in the center of the plow. A central draft is gained. Moreover, when plowing near the vine to throw the dirt away from it, some provisiou must he made to avoid injury to the shoot which is left on the stem of the vino and furnishes the next year's growth. This shoot is high enough to nllow the land-side to pass underneath it; hut when the standard is flush with the land-side, it is obvious that both it and the heam would strike the shoot and break it; hut by moving the standard over and out of line with the land-side, both standnrd and heam will pass by the shoot and the land-side will pass under it.

APPARATUS FOR OYSTER CULTURE.—Christopher Schmitz, S. F. No. 301,285. Dated July 1, 1881. This new process and apparatns for oyster culture consists of a combination of devices. The inventor has a novel apparatus consisting of an annular perforated vessel set on a surrounding hasin communicating with canals provided with rocks and rubbish in their hottoms, and a means for supplying a gentle flow of sea water to said perforated vessel. The oysters when near their spawning or "sick" time, are placed in a vessel containing sea water. This time or event is when the two vesicles of the shell-fish which contain the eggs and milk commence to swell until the membrane bursts and fertilization takes place. Soon after this the spat or spawn may he extracted by the operator, or the shell-fish will itself expel them in the course of nature. A very fine stream of water is allowed to pass through a pipe into the vessel. Thence it passes through the perforated sides of said vessel in innumerable small and gentle currents widely spread into a sort of hasin. The young are alive when expelled hy the mother and they float around and pass through the sides of the vessel into the basin. Thence they float gently into canals until they find the stones and rubbish to which they adhere by means of a small tentacle with which they are provided. The first necessity of life of the young oyster is that it shall find something to which to adhere and he ahle to cling to it. If it cannot do this it perishes. This apparatus as a whole conduces to the general result of giving each living young oyster a chance to find its lodgment.

How to Remit to this Office.

ALWAYS GIVE THE NAME OF YOUR POSTOFFICE every time you write to us for any purpose. We cannot find your name on our large lists unless you do. Also write your own name plainly, and the name of the paper you remit for.

THERE ARE FOUR WAYS BY WHICH MONEY, in payment for this paper, can be sent by mail at our risk—by a POST-OFFICE MONEY ORDER, by a REGISTERED LETTER, by a BANK DRAFT or POSTAL NOTE.

MONEY ORDERS CAN BE OBTAINED at the Postoffices of most of the large towns. For the small amount of eight cents you can buy a Money Order upon the San Francisco Postoffice, for the amount you wish to send us, and WE WILL BE RESPONSIBLE for its safe arrival.

REGISTERED LETTERS. If a Money Order Postoffice is not within your reach, ask the Postmaster of your town to register the letter you wish to send us. It costs but ten cents. Then, if the letter is lost or stolen, it can he traced. You an send money in this way AT OUR RISK.

BANK DRAFTS. A Draft upon any San Francisco, New York, or Washington, D. C., bank, we can use, if it is made payable to the order of the publishers of this paper, San Francisco.

POSTAL NOTES CAN BE OBTAINED for sums less than five dollars at all Postoffice Money Order Offices. For a Postal Note you must pay three cents, and the Postal Note must be inclosed in your letter to us. These Postal Notes are payable to bearer, and therefore ARE NOT SO SAFE AS A MONEY ORDER.

SMALL SUMS of money generally reach us in an ordinary letter, but we cannot he responsible for losses unless you send in one of the four ways mentioned above.

SILVER BY MAIL.—Do not send over 25 cents in silver by mail unless you wrap it carefully, and put an extra three-cent stamp on the letter for every 50 cents in silver it contains. Failure to observe this may cause your letter to get lost.

POSTAGE STAMPS will be received in full payment or for fractional parts of a dollar for subscriptions of the denomination of one and two cents.

Address the PUBLISHERS (and not individuals connected with) this paper, No. 252 Market St., San Francisco.

Cheap Ore Pulverizer.

There is for sale in this city, by I. A. Heald, American Machine and Model Works, 111 and 113 First street, a Rutherford Pulverizer, an improved revolving barrel crusher, which was only used a few times and is as good as new. It will be sold very much below costs, and miners who are in need of such an appliance for a small mine will do well to make inquiries concerning it. It is suitable for a pulverizing mill for powder or other substances. References as to above can be had upon applying to this office.

Don't Fail to Write.

Should this paper be received by any subscriber who does not want it, *or beyond the time they intend to pay for it*, let them not fail to write us *direct* to stop it. A postal card (costing one cent only) will suffice. We will not knowingly send the paper to anyone who does not wish it, but if it a continued, through the failure of the subscriber to notify us to discontinue it, or some irresponsible party requested to stop it, we shall positively demand payment for the time it is sent.

New Book on Assaying Gold & Silver Ores.

BY C. H. AARON.

For Practical Workers. $1.

This new work is written by an experienced metallurgist who has devoted many years to assaying and working precious ores on the Pacific side of the American Continent. He writes whereof he knows from personal practice, and in such plain and comprehensive terms that neither the scientist or the practical miner can mistake his meaning.

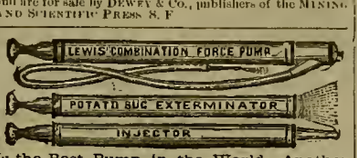
The work, like Mr Aaron's former publications ["Testing and Working Gold and Silver Ores," "Leaching Gold and Silver Ores"] that have been "successfully popular" is written in a condensed form, which renders his information more readily available than that of more wordy and less conscientious writers. The want of such a work has long been felt. It will be very desirable in the hands of many.

Table of Contents:

Preface; Introduction; Implements; Assay Balance; Materials, The Assay Office; Preparation of the Ore; Weighing the Charge; Mixing and Charging; Assay Litharge; Systems of the Crucible Assay; Preliminary Assay; Dressing the Crucible Assays; Examples of Dressing; The Melting in Crucibles; Scorification; Cupellation; Weighing the Bead; Parting; Calculating the Assay; Assay of Ore Containing Coarse Metal; Assay of Roasted Ore for Solubility; To Assay a Cupel; Assay by Amalgamation; To Find the Value of a Specimen; Tests for Ores; A Few Special Minerals; Solubility of Metals; Substitutes and Expedients; Assay Tables.

The volume embraces 106 12mo. pages, with illustrations, well bound in cloth; 1884. Price, $1, postpaid. Sold by DEWEY & CO., Publishers, No. 252 Market street, San Francisco.

N. B. This is Part I of three volumes on assaying by the same author. To be followed by Part II Gold and Silver; Part III Lead, Copper, Tin, Mercury. A majority of the best mining publications yet printed have been issued by and are for sale by DEWEY & CO., publishers of the MINING AND SCIENTIFIC PRESS, S. F.



Is the Best Pump in the World. Another New Improvement in Lewis' Patent Spray Attachment.

Can change from solid stream to spray instantly. Regular retail price $6. Weight, 4½ lbs. Length, 32 inches.

FOR SALE BY JOHN H. WHEELER, 204 Montgomery St., S. F.

P. S.—A sample can be seen at this office.

A POSITION AS METALLURGIST.—17 years' experience in Smelting and Refining Works; Expert in concentration of ores. Address:

T. E., Box 2361, San Francisco, Cal.

SURVEYORS—INVENTORS.

A. SCHERCH, Mathematical Instrument and Model Maker, 335 Bush street, S. F. Scientific Apparatus and Experimental Machinery at short notice.

Dewey & Co.'s Scientific Press Patent Agency.

OUR U. S. AND FOREIGN PATENT AGENCY presents many and important advantages as a Home Agency over all others, by reason of long establishment, great experience, thorough system, intimate acquaintance with the subjects of inventions in our own community, and our most extensive law and reference library, containing official American and foreign reports, files of scientific and mechanical publications, etc. All worthy inventions patented through our Agency will have the benefit of an illustration or a description in the MINING AND SCIENTIFIC PRESS. We transact every branch of Patent business, and obtain Patents in all countries which grant protection to inventors. The large majority of U. S. and Foreign Patents issued to inventors on the Pacific Coast have been obtained through our Agency. We can give the best and most *reliable* advice as to the patentability of new inventions. Our prices are as low as any first-class agencies in the Eastern States, while our advantages for Pacific Coast inventors are far superior. Advice and Circulars free.

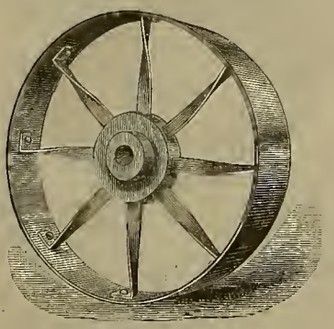
MACBETH'S
—PATENT—
STEEL PULLEY.



Advantages of these Pulleys.

They are less than half the weight of cast-iron pulleys; are polished on the face; are made either crowned or straight, and are turned in the lathe the same as the best make of cast-iron pulleys.

They are carefully balanced. They are subject to no contraction strains, and can be run at very high speed without danger of bursting.

On account of their great lightness and the form of the arms, they absorb less power than any other pulley.

They are *the only pulley of the kind* which runs true. They cannot be broken in transport.

TESTIMONIAL:

MATHER LANE SPINNING CO. (Limited), LEIGH, ENGLAND, Nov. 5, 1883.

N. Macbeth, Esq.—Dear Sir: The Patent Steel Pulleys supplied throughout to our No. 2 Mill are working to our entire satisfaction.

They are very true, and are about 50 per cent lighter than the cast-iron pulleys in our No. 1 mill.

Yours faithfully,
For the Mather Lane Spinning Co. (Limited),

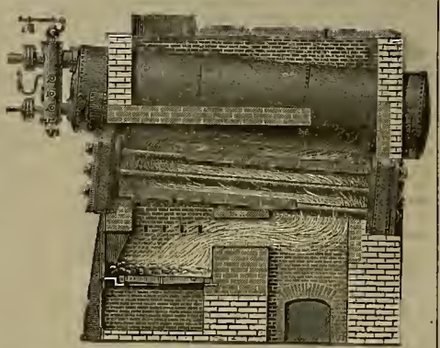
HEINE PATENT SAFETY BOILER,

RISDON IRON AND LOCOMOTIVE WORK

Sole Agents for the Pacific Coast, - Corner Beale and Howard Sts., San Francisco.

Economy in space and fuel. Safety at high pressures. Freedom from scaling. Equally adapted for power and heating purposes. Especially adapted for mills, factories, hotels, stores or any place where safety is a necessity. Will work well with muddy water and any kind of fuel.



TESTIMONIALS.

ST. LOUIS, MO., Sept 28, 1883

Messrs. Adolphus Meier & Co.—GENTLEMEN: We cheerfully certify that the "*Heine Patent Safety Boiler*" put up by you in our establishment has proved very satisfactory in its working. The chief points of excellence in the "Heine Safety Boiler" are its economy in fuel and space, freedom from scaling, aptitude for power and heating purposes, working equally well with clear and muddy water. We warmly recommend it to all using steam machinery. Yours truly,

ANHEUSER-BUSCH BREWING ASS'N.

OFFICE OF SUPT OF ROYAL RAILWAYS, BERLIN, Sept. 23, 1883.

To Mr. H. Heine, Civil Engineer: In reply to your inquiry of September 2d, we respectfully inform you that the three boilers built under your patents, under steam since September 25, 1881, at the Alexander Place Depot, as well as the two at Friedrich Strasse Depot, under steam since September 22, 1882, have given good satisfaction, requiring no repairs whatsoever to date. The internal cleaning of the boiler was always accomplished with ease on account of the convenient arrangement of the tube caps, the adhesion of scales being fully prevented thereby, and the boilers kept in prime condition.

(Signed): BRAUCKE.

RANKIN, BRAYTON & CO.,

127 First St., San Francisco, Cal.

BUILDERS OF

MINING MACHINERY.

Plants for Gold and Silver Mills, embracing the latest and most improved machinery and processes for base and free ores. Water Jacket Smelting Furnaces for silver, lead and copper ores, with new and important improvements, superior to any other make. Hoisting Works, Pumping Machinery, Chloridizing Furnaces, etc. We offer our customers the best results of thirty years' experience in this special line of work, and are prepared to furnish the most approved character of Mining and Reduction Machinery, superior in design and construction to that of any other make, at the lowest possible prices. We also contract to deliver, in complete running order, Mills, Furnaces, Hoisting Works, etc., in any of the Mining States and Territories. Estimates given on application. Send for Illustrated Circular.

JET PUMPS.

THE CHEAPEST AND BEST

STEAM PUMP for Lifts from 10 to 70 ft.

FOR IRRIGATING PURPOSES

And all General Work where a Simple Durable Pump is Required.

NO VALVES! NO PISTON!
NO OIL REQUIRED!

Can be Run by a Child.

EACH PUMP GUARANTEED.

PRICE—One-tenth of an ordinary Steam Pump, same apacity.

Call and See One in Actual Operation.

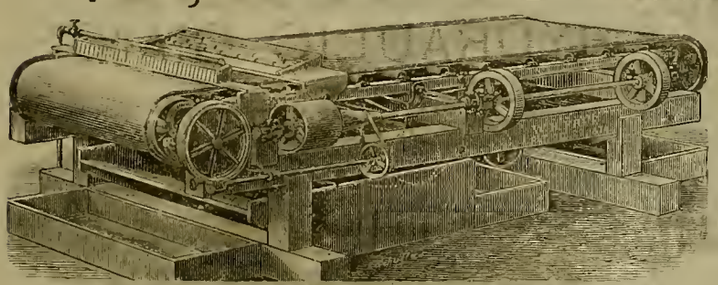
$1,000 CHALLENGE!



THE FRUE ORE CONCENTRATOR, OR VANNING MACHINE.

PRICE REDUCED, Jan. 1, 1884, to FIVE HUNDRED and SEVENTY-FIVE DOLLARS ($575.00).

OVER 800 ARE NOW IN USE. Saves from 10 to 100 per cent. more than any other Concentrator; concentrations are clean from the first working. The wear and tear are merely nominal.

A machine can be seen in working order and ready to make tests at the office of Hinckley, Spiers & Hayes, No. 2 20 Fremont Street, San Francisco.

To those Intending to Manufacture or Purchase the So-called "Triumph" Concentrator, we Herewith State:

That legal advice has been given that *all shaking motion* applied to an *endless traveling* belt used for concentration of ores is an infringement on patents held and owned by the Frue Vanning Machine Company.

That suit has been commenced in New York against an end-shake machine similar to the Triumph, and that as soon as decision is reached in the courts there, proceedings will be taken against all Western infringements.

That we are and have been ready, at any time, to make a competitive trial against the Triumph, or any other machine, for stakes of $1,000.

ECLIPSE DOUBLE TURBINE WATER WHEEL.

Points of Superiority:

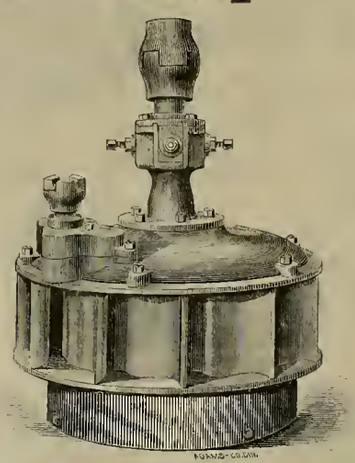
FIRST.—Simplicity, being composed of the smallest possible number of parts.

SECOND.—The Wheel, Outer Case, Register Gate, and Top, each being one casting, and all the work on them being performed by machinery, and fitted to a standard gauge, secures the highest perfection in construction and operation, and the utmost strength.

THIRD.—The entire absence of rods, bolts, levers, light castings, or "traps" of any kind, securing the greatest durability, with entire immunity from derangement of parts and breakage, so common in all complicated wheels.

FOURTH.—The conical interior of the wheel, which secures perfect freedom of vent for both tiers of buckets, enabling the wheel to rid itself immediately of "dead water" without friction. This feature is entirely original with this wheel, and is found to be of very great practical importance.

FIFTH.—Its "Duplex Chute," formed by the Register Gate and outer case. The outer case moulds the current of water, delivering it in a solid body through that part of the Chute comprised in the Register Gate on to the wheel. This Chute being fixed, the direction of the current is never changed, nor its velocity checked, consequently nearly the same per cent. of power is obtained with the gates only partially drawn as when fully open.



SIXTH.—A Gate thoroughly protected from vertical pressure, which, when partially closed, does not break the column of water or change its proper direction, which is easily operated, and yet shuts so tight as to prevent leakage; and the shutting of which is not likely to become obstructed or prevented by foreign substances.

SEVENTH.—The housing up of the pinion and segment for operating the gate, which entirely prevents all danger of breakage by foreign substances getting between the teeth. No other concern does or can use this improvement, which effectually does away with a source of most frequent annoyance and delay.

EIGHTH.—The amount of power it yields, together with its Simplicity, Durability and Strength, fairly entitles our wheel to the name given it, The Eclipse Turbine. In further proof of the power of this wheel, we invite a careful inspection and comparison of our tables with corresponding tables for all other similar wheels.

VOLUME XLIX Number 3.

Poison in Food Receptacles.

In the PRESS of last week we gave an account of a discussion on the subject of adulteration of tin by lead, which took place before the California Academy of Sciences. We notice since that this subject is attracting attention at other places. Some Brooklyn people were taken violently sick after eating ice-cream which stood for some time in a copper freezer, the tin lining of which must have been defective, has brought attention again to the danger of poison in food receptacles. Many apparently inexplicable cases of poisoning by ice-cream have been noted, and criminal accusations have been made against innocent persons.

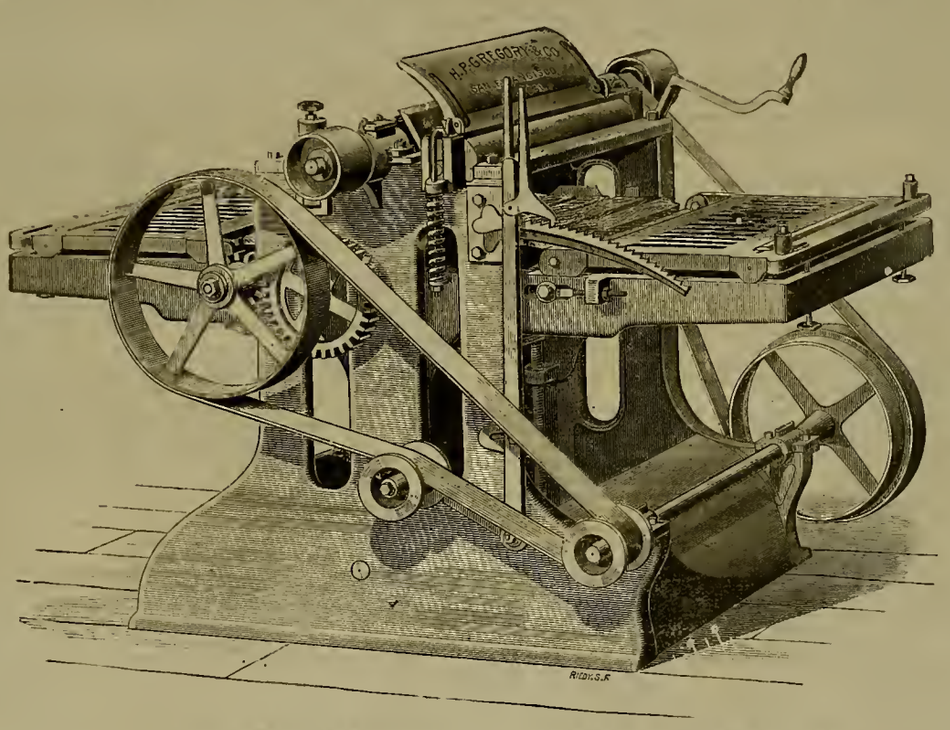
But in the case of canning goods in tin made with a mixture of lead, the community can protect itself. Laws could be easily framed and carried out severely punishing those manufacturers who put up food substances in adulterated tin. The acid of fruits and vegetables acts upon poor tin in such a way that the food contained in the cans may soon become deleterious, if not positively poisonous, and the interest of health and industry involved is so great that packers should avoid the use of any but the best of cans. The use of glass should be encouraged but tin is more convenient and less expensive for the preservation of many kinds of food, and the prohibition of the use of tin of an inferior quality is a proper subject for legislation.

The subject, as well as that of drinking water from lead pipes, should be carefully considered. People buy canned goods because they are convenient and cheap; but they will stop their purchase entirely if it is found there is danger in their use. It behooves the large manufacturers, therefore, to guard against any possibility of accident by using only good tin in making their cans. The dull leadish color of adulterated tin may be readily recognized by those who have ever had an opportunity to compare it with good tin: but not everyone has had that opportunity. Moreover, the sides of most tinned food receptacles are covered with paper labels. With the top and bottom good tin, and the body of the can poor tin and labeled, the public would be deceived. Swift and merited punishment to the makers of adulterated food receptacles or impure food would soon work a cure of the evil.

In the mining suit of Albion *vs.* Richmond at Eureka, Nev., the Albion has amended its complaint and now claims loss through the Richmond Company of 9,208 tons of ore, worth $65 per ton, and $10,000 damages to the mine, making in all $608,520. The Richmond, in its amended complaint, denies the Albion's title to the ground in dispute and avers that not more than 210 tons of ore were taken out of that ground and that the same was worth not to exceed $4 per ton.

The Pacific Feed-Surfacing Machine.

The accompanying illustration represents a new improved endless or traveling-bed planing machine, built by Messrs. H. P. Gregory & Co., Nos. 2 and 4 California street, San Francisco. It is constructed from new patterns, and includes all the newest and latest improvements which experience has shown is required to do good work at a rapid rate of speed. In constructing this machine, weight has formed a vital element, and the makers have aimed to place the material in a scientific manner, and where it is best calculated to withstand the strain in planing heavy timber. The spindle, are of the best quality of cast steel. The slats of the feeding apron and the bearers (of which there are four), are of cold blast iron, made as hard as can be worked.



PACIFIC ENDLESS-BED FEED-SURFACING MACHINE FOR BOARDS OR TIMBER.

The rolls are of refined wrought iron, of extra size, and cannot be broken by use. The cutter head is three-sided, and of that form which experience has demonstrated to be the best for doing work. The cylinder is belted at both ends, and the pulleys are extra large, both in diameter and face. The gearing is strong and will last as long as the machine. All feed belts are open or straight and run on wide pulleys.

The extension tables are of good weight, and are hinged to raise or lower to suit different thicknesses of material, so that clipping the ends of boards can be entirely obviated. The machine planes from the thinnest material to 12" thick. The cylinder may be run from 3,500 to 5,000 revolutions per minute. The arrangements for raising or lowering the main table is simple and easy to operate. One turn of the crank raises or lowers one sixteenth of an inch. Every machine is tested before leaving the works so as to ensure satisfaction. Each machine is provided with a heavy counter shaft, with hangers for floor or to hang from the ceiling as may be desired. Has tight and loose pulleys 12" diameter 8" face, and should run 1,000 revolutions. Weight 3,500 lbs.

Two miners were killed and others wounded by an explosion in the Syndicate mine, Bodie, recently. A number of miners were passing through drift No. 2 at the time of going on shift, when it seems that the above named were in close proximity to each other. Renaud carried giant cartridges in his hip pocket, and was walking in advance of Wright and Smithem, following in the rear. He (Smithem) carried some giant cartridges in his right hand jumper pocket, and in the left pocket were some fuse cut in short lengths, and capped ready for use. In his right hand he carried a candle, while the arm supported a pick and picker—a tool used in place of a drill in soft ground—and the most probable theory is, that the bunch of fuse with capped ends were sticking out of the pocket, and came in contact with the candle, exploding the caps and firing the giant.

NEVADA ANTIMONY MINES.—John P. Finley, a mining expert, is at Battle Mountain looking at some prospects with a view of purchasing. He represents the American Antimony Company, which has large antimony reduction works in Boston, Massachusetts, and several other Eastern cities.

THE nitre deposits of Churchill county, Nev. are claimed by B. F. Dobe, F. C. Leavitt, M. Southard, C. H. Mason and others.

Mine Ventilation.

A treatise "On Practical and Theoretical Mine Ventilation," by Eugene B. Wilson, instructor in Drifton Industrial School for Miners and Mechanics, has just been issued by John Wiley & Sons, New York. The work comprises about 130 pages. The author, aware of the interest manifested by miners in the subject of mine ventilation, which is so intimately connected with their daily employment, has endeavored to deal with ventilation in such a manner that no one with a fair knowledge of the English language and of arithmetic need dispair of mastering it. He has endeavored to do away with abstruse language and such highly mathematical formulas as are only calculated for well educated engineers. Each article is illustrated by an example. There are many practical hints given for engineers; but the book is mainly intended for miners, not for engineers. From the chapter on "laws affecting air in mines," the following paragraphs are taken. The laws affecting the circulation of air through mines or confined passages such as gangways, have been ascertained principally by such men as Magnus, Regnault, Gay-Lussac, Daubisson, Peclet and others, and are as follows: "The volume assumed by a given weight of air is inversely proportional to the pressure on each unit of surface under which it exists, so long as the temperature remains unaltered. Consequently, if we take a cubic foot of air under the pressure of five pounds, it will only be one-half a cubic foot under a pressure of ten pounds, and one-third of a cubic foot under a pressure of fifteen pounds. When the pressure is constant, the volume is uniformly in the ratio of 1-459 part for each additional degree of heat, Fahr.

When air is discharged through orifices offering no sensible frictional resistance, the result is sixty-five per cent of the quantity due to the velocity multiplied by the area in case of a thin plate; ninety-three per cent in case of a short cylindrical tube; and ninety-five per cent when the tube is conical, and the area taken from the small end. This contraction of the flowing air, which is similar to that which takes place when water is discharged through pipes under the same conditions, has the effect of reducing the quantity discharged in a given time below that which would be due to the velocity, if it existed, over an area equal to that of the orifice or tube. This contraction of the flowing air is termed the "vena contracta."

When air is impelled through a confined passage, the pressure or head of air-column required for its propulsion is proportional *to the square of the velocity*; so that to double this velocity there must be four times the head; to treble it, nine times the head; etc.

THE Leadville concentrating works of Estey and Hall were destroyed by fire this week.

An Immense Tin Deposit.

If the reports of the recent discoveries of tin at the Black Hills, in Dakota, are of a reliable character, as they certainly appear to be, the United States is destined to become the leading tin producer of the world.

The world's production of this metal last year amounted to 15,770 tons, about one-third of which was consumed in the United States. The countries which produce tin are those bordering on the straits of Malacca, in the East Indies, Australia and the Cornwall district in England. All the tin consumed in this country has been imported almost wholly from England and English colonies, but the recent discovery in the Black Hills will, if the statements made are correct, revolutionize the trade. According to Professor Bailey, the deposits there are so vast as to be able to supply the whole world for centuries.

The center of the district which covers an area of twelve miles by seven or eight, is Harney Peak. The tin-bearing rock can be quarried from the surface instead of being followed underground and he claims to have seen veins of it of more than fifty feet in width which will average much better than the Cornish veins, where the ore has to be raised from a great depth at a heavy cost. Of the stream tin which can be obtained by sluicing and which will yield about fifty per cent of pure tin, he speaks as follows:

"The stream tin alone is so abundant that all the companies that could possibly work it could go on for 20 years without exhausting it. Yet this is but the waste, you might say, of the main deposit—the mere scraps that water and frost have detached, a little bit at a time from the great mass and source of the ore, which is Harney Peak, itself, more than a mile high, and the surrounding tin-bearing rock, which, as I have already said, extends for miles. It is impossible to imagine this great body of ore ever being exhausted. As to profit, the richness of the ore compared with that of any other tin-bearing district of the world settles that conclusively."

The First Discovery

Of this deposit was made in the Etta mine, in Harney range, about the first of June, 1883, since which time discovery has been made at several localities of tin stone, the most important being that of Nigger Hill. Mr. Chapman, one of the owners of this mine, furnishes the following facts to a correspondent of the *Mining Review:*

The mineral was first noticed by Mr. Box, who, upon being shown a piece of heavy black rock taken from the gravel of the creek, announced the fact that it was tin. Search was at once instituted for the ledge which had afforded such an abundance of the ore in the shape of stream tin, and which had been the hane of the miners ever since placer mining had been inaugurated in the gulch, its high specific gravity rendering it almost impossible to save fine gold in sluicing or washing without amalgamation. The stream tin is found usually as sand or small pebbles, though larger pieces have been found. One piece exhibited by Mr. Chapman weighs seventy-two ounces. The search for the ledge resulted in the discovery of a large vein, averaging over 100 feet in width, which has been traced for a distance of four miles. The inclosing rock of all the ore I have seen is orthoclase, the cassiterite being scattered irregularly through the mass in minute grains and crystals of considerable size. The country rock, through which the vein passes, from the description of Mr. Chapman I should judge to be a syenitic gneiss.

A large number of claims have been located on the vein, prominent among which are the Michigan, Lily, Rough and Ready and Giant. A curious fact has been demonstrated on one portion of the lead; the tin-bearing rock comes to an abrupt termination and its place is taken by gold-bearing quartz, which continues for about 500 feet, when the tin ore as suddenly makes its reappearance, and as far as is known, continues uninterruptedly. A shaft has been sunk to a depth of thirty feet on the gold-bearing portion of the ledge, which prospects well. A tunnel which was run to tap the vein on the Giant, after being driven a distance of 250 feet and cutting several seams of ore—all of which, I believe, carry tin—encountered a vein, into which the tunnel has been extended 100 feet, the face still being in ore carrying tin.

The miners have made rude tests of their rock by pulverizing and concentrating by washing; the concentrated ore then being smelted in a blacksmith's forge, the results invariably being good. In one instance, 40 pounds of rock was reduced to 10 pounds, and a bar of metallic tin, weighing one pound, smelted from it. The process being rude, was necessarily very imperfect; as cassiterite carries about 78 per cent of tin, the result should certainly have been more than 25 per cent. The main chain of mountains, constituting the axis of the uplift of the Black Hills, has a general trend northwesterly and southeasterly, and as the tin mines of Nigger Hill are located near the northern extremity of these mountains, and the mines of Harney near the southern end, it is reasonable to expect that other tin veins will be discovered along this range; indeed tin has been discovered several miles north of Harney. Considerable development may be looked for in these mines during the coming summer.

Productive Montana Mines.

In an article on the mines of Butte, Montana, the Butte *Inter-Mountain* says:—Very few people who live in Butte understand the extent of its production as compared with that of other mineral sections of the great west. This district embracing an area of mineral bearing ground scarcely three miles square, is producing silver and copper at the rate of a million and a quarter of dollars per month. The total production during the first quarter of the current year was upwards of $3,000,000, figuring copper at 13 cents and silver at 105. Since then freight statistics show an increase of fully one-fourth in the outgoing tonnage, the shipping product of the Anaconda alone having been increased from 2,500 to 5,000 tons per month. Therefore $1,250,000 is a safe and conservative estimate of the monthly product of the Butte district. It is more than the combined gold and silver product of the state of California. It exceeds the entire output of Nevada. It is at least a fourth greater than Utah. It equals the monthly yield of all the mines in Arizona. It is more than aggregate the production of New Mexico and Idaho. Leaving the camp of Leadville out of consideration, it is more than the combined production of all the famous mining counties of Colorado. It is equal to the production of Leadville itself which was $18,000,000 last year, but which will be less than $15,000,000 for 1884 according to the present output and the ruling price of lead. Next year the production of Butte will far exceed that of Leadville, for while the yield of our Butte mines is constantly increasing that of the once noted blanket veins of the great carbonate camp is gradually but surely diminishing.

It thus appears that after a struggle lasting through five years of vicissitude and three years of increasing prosperity, the camp of Butte has advanced to the first position among the mineral producing districts of the United States and of the world. There are no reasons why it should not. There are many reasons why it should. The advance, when once begun, was rapid. In 1880, the total production of the district was $1,428,088.26; in 1881, it was $4,075,150.70; in 1882, it was $6,200,000; in 1883, it was $9,027,843.54; during the current year will be not less than $15,000,000, estimated on returns for last quarter, which will make a total for the five years of $35,731,082.50, as being Butte's contribution to the material wealth of the world during the time specified. How many mining and business men of Butte ever took the trouble to figure up the total output? To those who have not what a revelation are the above figures?

That Butte is now the leading producer among the mineral districts of the world should not be a matter of surprise. The claim is based on the simple fact that it contains the biggest mines in the world. They have ceased to be prospects. Their present output is tangible evidence of their wealth and their future has been by recent development removed beyond the pale of doubt. Let us take a look at the situation:

The Copper Interests.

The Anaconda, with the finest equipment of any mine on the Pacific coast, is down 800 feet. The extraction of ore is proceeding from 14 faces. On the lowest level the ledge is 40 feet wide, strong and well defined. Over 200,000 tons of copper ore, which in any other country would be deemed high-grade, are on the dump. The daily product of shipping ore alone is 160 tons. In the valley the company is erecting the largest copper smelter in existence. Nearly 800 men are on the pay-roll. Last year it sold nearly $2,000,000 worth of copper, and will beat the record hollow this year. The hoisting capacity of the Anaconda machinery is as great as that of any on the Comstock, not excepting that of the Con. Virginia. The policy of the company at present is one of reticence and conservatism, hence the absence of detailed information as to the present workings.

The Colusa is another great property. Its shaft is 400 feet deep: its productive capacity 200 tons per day; its output, every pound the smelter can treat with six furnaces. Above the 260-foot level it has enough ore in sight to supply the works for two years. Its crude and smelted product last year realized over $2,000,000. It is a regular dividend payer.

The Parrot ranks third among our great producers. It supplies a smelter containing six furnaces, and so great is its developed productive capacity that the erection of a new smelter, of the same capacity of the old one, though on a different plan, is in contemplation. The Parrot is a regular dividend payer.

The Colorado smelter is also doing a great work. Supplied chiefly by the Gagnon, a mine of almost inexhaustible productiveness, it also treats large amounts of custom ores and is producing over $1,000,000 per year, principally in silver. It is a regular dividend payer.

The Bell, on the 400 foot level, has developed a bonanza and supplies 30 tons of high grade silver-copper ore per day, which is reduced by blast furnace. The vein is strong and well defined and varies in width from 6 to 23 feet. The ore, of which vast quantities are available for extraction, carries more silver than any other copper ore in the district. A new shaft has recently been sunk on the property which is now in good shape for deep exploration.

In addition to the mines mentioned above, whose owners operate smelters in connection therewith, are the Clear Grit, a mine in process of active and skillful development. It has a good record and shows an extensive ore body enclosed by walls well defined and with a regularity of dip and strike which indicates an enduring future. The shaft is now going to the 320 foot station, and when the mine shall be opened from that point a concentrator and smelter will be erected. They are fully justified even by the present appearance of the mine.

The Mountain View, now developed to the 500 foot level, is destined to rank with the great copper producers of the district. In width of vein it has no superior, and it has all the characteristics of the Anaconda, of which it is an extension. C. X. Larabie owns the property and superintends its development.

Clark's Colusa is another productive property without a smelter attachment. It is producing daily 75 tons of copper ore from the 100 and 200 foot levels, and the shaft is being dropped to the 300 foot station with all possible expedition.

Still another important copper mine is the Liquidator, whose product averages 100 tons per day. Of this, nearly one-half is shipped to Swansea, the remainder being dumped for future treatment.

Ramsdell's Parrot is another mine capable of a heavy production, but it is not being worked on a large scale.

The Silver Interests.

The silver interests of Butte are scarcely less important than the copper interests, though they employ fewer men and are believed to be less profitable. They are low grade mines, but they are extensive, permanent, accessible, uniform in dip and strike, not hard to work, and with capital, economy and intelligence, are all susceptible of profitable development. They are big company mines.

The Lexington is the leading silver mine in the Territory. Last year it produced $1,289,685 34. Its monthly yield now varies from $95,000 to $100,000. The shaft is 500 feet deep, and the vein, which has always been remarkable for the uniform richness of its ores, shows up better on the lower level than in any of the upper workings. The Lexington mill is among the most perfect structures of its kind on the continent. It treats daily 50 tons of ore. The Lexington is a regular dividend payer. Last year it paid over $200,000. This year it has already declared a dividend of $80,000, and another one will shortly be forthcoming. Up to June 1st the Lexington produced $514,092 since the 1st of January.

The Moulton is also enrolled among the list of Butte's dividend paying mines, the company having just declared a $400,000 dividend and having a reserve fund of over $100,000. It is one of the best managed mines in the district. Two years ago, owing to the ill-advised action of the Bowers sindicate, the property was in debt almost as much as the Alice, but a policy of rigid economy has entirely dissipated this burden, and the company is now free from all encumbrance and is clearing a handsome profit on a comparatively low-grade ore. Operations are chiefly confined to the 2d, 3d and 4th levels, from which about 40 tons of ore are daily extracted. The bullion product averages from $50,000 to $55,000 per month. Up to June 1st the Moulton produced $261,250 since the 1st of January.

The Alice maintains its usual production and is credited with an output this year of $520,843 up to June 1st. The bulk of the ore from the Alice is now coming out of the south vein, whose product, added to that of the Magna Charta, makes between 90 and 100 tons of ore daily treated in the two mills of the company. The Alice has just paid a quarterly dividend of $50,000, but we regret to say that the company is about $200,000 in debt, which should be paid off before the declaration of any further dividends. It is stated that arrangements have recently been made for the liquidation of the indebtedness by small payments, made at the company's option, covering a period of four years. Walker Brothers say they will only charge 4 per cent. The Alice is a big institution, employing over 300 men and contributing to the output of the camp over $1,000,000 per annum.

Among other important silver mines of the district, whose owners have no mill in which to work their ore, are the Poser, producing daily 20 tons, which is being treated in the Silver Bow 30-stamp mill; and the Orphan Girl, producing daily 30 tons, which is being treated in the Dexter 15-stamp mill. The Bonanza, the Stevens, the Blue Bird, Auraria, the Amy-Silversmith, the Original, the Maria and a score of lesser properties are being actively developed and producing well.

This brief review of the names, output and development of Butte's leading copper and silver properties may suffice to show the ground upon which is based the claim that this is the leading mining district of the United States, and of the world. The railroad shipments to and from the camp are alone sufficient evidence of its greatness. According to the statistics of the first six months of the current year the incoming and outgoing freight will aggregate 250,000,000 pounds, of which the ore and matte shipments will amount to at least 100,000,000 pounds, or 50,000 tons.

Treating Rebellious Ores.

The vast importance of some successful process of treating rebellious ore gives every experiment in this direction unusual interest, and every operation is eagerly scrutinized by practical and scientific men whenever presented. For some months Prof. Cherry, of Chicago, associated with a number of prominent capitalists, has been experimenting upon a system which he has invented for this particular purpose. During the present week an experimental run was made with some most rebellious and refractory ore, and the result, we are pleased to note, indicates a decided success. To better understand the process and method employed, we will give a brief synopsis of the operation as detailed by Prof. Cherry.

The furnace was charged with about 2½ tons of ore, which was particularly sulphurous and arsenical in its composition, the reduction of which has been unsuccessfully attempted at a number of different places. The apparatus used at present is an upright retort, with a capacity of from 2½ to 3 tons. The ore is broken to the size of a hickory nut or finer if required. The retort after charging is sealed so that air is excluded and the ore is treated in a vacuum.

Heat is then applied to the outside of the retort until a temperature of about 560 degrees is secured, indicated by a pyrometer inserted in the top of the retort. When this degree of heat has been attained, superheated steam is forced into the retort, under a pressure of from 15 to 25 lbs., and uniformly distributed through the entire mass. The steam in the retort and the heat outside is continued until from 600 to 630 degrees of heat are shown, when a considerable part of the sulphur will be thrown over and deposited as flour sulphur in a vessel for condensation and precipitation. The current of superheated steam is permitted to pass through the ore in the retort and to escape through a pipe provided with a check valve, by which can be regulated the pressure in the retort and the exit of the liberated sulphur which is carried over by the hydrogen in the steam, while the oxygen is taken up by the ore. This process is continued until the vapor and steam escaping fail to show any odor of sulphur, when, if the progress has been properly conducted, it will be found that all the arsenic and sulphur will be entirely separated from the ore and deposited as solids in the form of flour sulphur and chloride of arsenic, which product may be utilized.

To further carry out the intent of this deoxidizing and desulphurizing process, and to liberate the minerals under treatment from their inorganic constituents with which they are combined in nature as amorphous metalloids, and to free them from their associations, a current of super-heated air is at this point introduced under a pressure of 20 pounds, through the same apparatus through which the steam was injected, and forced through the mass of ore in the retort. "It is well known," Professor Cherry says, "in metallurgy, that there are three or more kinds of amorphous sulphur, also phosphorus, in most of the metalloids. The amorphous constituents, contained in these ores, cannot all be volatilized and carried over by the steam, so, in order to most thoroughly remove them, it is necessary to apply a current of super-heated air. The oxygen of the air combines with the metalloids in their nascent condition, which produces a union or combination which effectually secures the separation desired." This current of air is also made use of to replenish the partially treated ore with organic oxygen, and may be continued until the ore is thoroughly oxidized.

It is evident that all sulphuret, arsenical and rebellious ore, may be satisfactorily treated by this process. It may be noted also that the heat required being only about 600 degrees, insures against loss by volatilization, as there are few of the metallic compounds fusible at this degree of heat. In the treatment of iron ores the utmost satisfaction has been obtained, and it is stated that the metal secured has large magnetic properties, which give an important value.—*Chicago Mining Review.*

GOLD, SILVER AND NICKEL.—Miners from several camps in the western part of the county who came here to celebrate the Fourth of July, brought samples of the ores in which they are working, in with them. Three parties of them met by accident at the *Silver State* office. L. F. Dunn, from Spring Valley, had a piece of gold-bearing quartz worth two-thirds of its weight in gold, which he found in one of his mines in Spring Valley. Wm. Woolcock, J. C. Harris and Jack Phillips had a box of silver ore from the Grizzly mine, in Star district, that assays $2,500 to the ton. It was taken out of the lead about 200 feet below the surface, and there is plenty of it. Some of the chunks of ore will be sent to Col. Thomas, of Sutro, for exhibition at the New Orleans exposition. The ore is mainly black sulphurets of silver, liberally sprinkled with flakes of native silver. Gregg Olsen and P. M. O'Brien brought chunks of nickel ore from the Lovelock mines near Cottonwood canyon, which assay from forty to sixty per cent metal. This ore was taken out of a four-foot vein some forty feet below the surface. These are only a few of the many metals and minerals which abound in our mountains and valleys, and which sooner or later will be worked. There are extensive copper, lead, and antimony mines, as well as gold, silver and nickel in Humboldt, besides salt, borax, sulphur and niter.—*Silver State.*

MECHANICAL PROGRESS.

Troublesome Boiler Settings.

The *Locomotive*, in a recent issue, directs attention to what it terms "relics of barbarism" in the form of flues running over the tops of boiler shells. "One would naturally suppose," says our contemporary, "that when the number of boilers that have been ruined, and the still greater number that have been seriously injured, by this form of setting is taken into account, no one would think of setting new boilers in this manner. Yet it is done every day, and by intelligent and experienced men, too. The argument used in its favor, that the passage of the hot gases over the steam space superheats the steam, and thereby renders it more economical, is a plausible one, and doubtless leads many steam users to adopt this form of setting; but if the circumstances are carefully examined the argument will be seen to be fallacious. It will be impossible to superheat steam when it is in intimate contact with such a large surface and body of water as it is in the case of a tubular boiler. Moreover, it will be difficult for any one who has in mind the poor conductivity of ashes, to see (when looking into one of these flues after it has been running a few months) how superheating of the steam can occur. Our experience with this form of setting (and it is a somewhat extensive one) points to this: So long as the brickwork at the sides of the boiler is perfectly intact, so as to compel all the gases of combustion to pass through the tubes before they reach the top of the boiler, and the water is good, the influence of the flue is *nil*, because if the boiler is properly proportioned the temperature in the flue cannot much exceed that of the steam in the boiler, and if the boiler is badly proportioned the deposit of ashes which soon collects on top of the shell protects it in a great measure, and this very protection is sufficient to prevent any superheating of the steam. But as soon as the side walls begin to heave, as they almost always do, and crowd away from the boiler shell, then the fire takes a short cut up past the side of the boiler into the flue, the draft is sufficient to carry away the ashes at the points where the openings are, and the exposed portion of the shell gets 'scorched.' Sometimes when the feed water is very acid, the overheating, while hardly violent enough to burn the plates, is just sufficient to bake all scum on the surface of the water on to the shell above the water line, beneath which coating corrosion goes on with surprising rapidity. We have seen boilers set in this way, with a coating several inches thick above the water line, after they had run only a year, beneath which the plates were eaten nearly half-way through, while other boilers in the same room had been running under the same circumstances, with the single exception that the flue did not pass back over the shell, for upward of 15 years, and only showed very slight traces of this action. This seems to us to be conclusive evidence of the injurious action of this form of setting, aside from the liability at any time of the side walls becoming so badly disarranged that actual overheating and fracture therefrom may occur."

American vs. English Tools.

The *Mechanical World* (London), in its issue of May 8th, pays a high compliment to the tools used in every mechanical trade in America, and also to our wood-working machinery. It says:

"The severe competition existing at the present time in the various mechanical trades causes manufacturers to look around and carefully consider every detail to detect where a saving may be effected. In this search we are disposed to assist them by suggesting the use of new and better tools. In too many works the proprietor appears to think that a machine will last forever, so long as it does not break down. We know tools, or rather machines, that have been at work 30, 40, and even 50 years, in certain old-fashioned works, regardless of the fact that newer machines are in the market which will do the work cheaper, better and quicker. We believe it pays a firm to pull out its old machinery and replace it directly there is better in the market. New applications of machinery require to be introduced. Wherever it is possible we are apt to follow in the old ruts. For instance, how few foundries employ sand-sifting machinery instead of the old-fashioned hand sieve, in which each molder sifts for himself.

America is considered the country most fertile in striking out new departures in the use of machinery. The sewing machine, and the applications of machinery to the manufacture of watches and clocks, are instances. Wood-working machinery is another case in which our American cousins have shown us how to use new machinery, besides which may be mentioned the machinery used for loading and unloading wheat in the huge elevators of the States, and which we have been half-heartedly copying the last few years. There appears to be a unanimity of opinion as to the superiority of the tools used in every mechanical trade in America, their great perfection, their adaptability to the daily changing needs of commerce, the saving of hand labor they insure, and the consequent economy in the price of production. It is true, says our London cotemporary, we are awakening to this fact, and are copying them in a great measure. But what is required is bolder action in the adoption of new machines directly they are in the market. In America, towns enter into a new trade with a zest of which we have no idea on this side of the Atlantic. M. Lourdelot, the Commissioner sent to America by the French Minister of Commerce to report upon the trade of the United States, says American intelligence has introduced improvements into the machinery used. Applications of machinery have been made in upholstery, cabinet making, silk weaving, bronze founding, jewelry and artificial flower making—trades which are founded upon European models, but are developed by improvements in tools and the use of new machinery. M. Lourdelot considers the great element of competitive danger in America with Europe arises from the superiority of the tools and machinery used, and the close watching of details too often neglected in Europe. Again, Norway furnishes us with another instance in which superior machinery enables that country to export in vast quantities their ready made doors and windows. The keen struggle for commercial success must force this question of new tools and new machinery upon us, and those who enter into the reality or this fact soonest will prosper best. With the disuse of old-fashioned tools will follow old-fashioned ways, methods and prejudices unsuited for this stirring age when orders are given by telegraph and telephone, and almost required by return of post.

Defective Iron Castings.

It is stated in the English papers that an examination of the broken girders of the fallen railway bridge at Denmark Hill showed that one of them was "honey-combed with air bubbles:" and it is assumed that, as this girder gave way, the extra weight thus thrown upon the others caused the accident. It is almost unnecessary to say, a correspondent in *Iron* says, that the so-called "air bubbles" are really hydrogen cells, and that the only explanation that has been (and probably ever will be) afforded of the source of this hydrogen is, that if not exclusively, it is mainly derived from the moisture of the atmospheric blast, which becomes decomposed on coming in contact with molten iron or steel, its hydrogen being thereupon absorbed by the metal. This occurs not only in the steel converter, but also in the blast furnace and in the remelting cupola. As a consequence, both steel and iron castings are unreliable, and a constant source of danger wherever their soundness is essential to safety; and they are accordingly unfitted for a number of important purposes for which forged metal, at a far higher cost, is considered necessary.

"I do not propose," adds Mr. Fryer, "to refer to any of the various methods and expedients which have been devised, and which are sometimes employed to cure the evil. It will, however, seem remarkable that no attempt has yet been made to get rid of the defect itself by eliminating the moisture from the blast, and thus removing the cause. One practical trial in that direction would go further to solve the whole question than all the theories that have been advanced, and all the laboratory experiments that have been tried since Dr. Muller's famous discovery of the real nature of the so-called 'air bubbles' or 'blowholes.'"

CHILLED CAST IRON ROLLERS.—Chilled iron is a form of cast iron with a surface as hard as flint. When molten iron is poured into moulds which are made of good heat-conducting material, such as iron, steel, &c., then the surface of the cast which comes into direct contact with the mould, forms an exceedingly hard layer. This is due to the fact that on account of the rapid cooling, the carbon does not separate as graphite, but remains chemically incorporated with the surface of the cast. Such products we know as chilled iron.

The rollers for mills are cast in drilled cast iron cylinders, and are therefore chilled on their entire surface, which hardness decreases towards their center, and as a consequence they can be hollowed with ease. Theoretically the manufacture of chilled iron appears exceedingly simple, practically it presents many difficulties, depending largely upon the chemical composition and proportion of iron, of the temperature and thickness of the walls of the mould and many other conditions.

The exceedingly small amount of wear of the surface of the best chilled rollers, recommends their use very strongly for milling purposes as compared with stones. In smooth rollers this wear is almost nothing, and even in grooved sills it requires many months also years before any sharpening is necessary.

A FRENCH writer on the subject of belts, as compared with toothed gearing, says: "In regard to the relative friction with belts or cords, and with toothed gearing, it is that theoretically the advantage is always, more or less, on the side of belts or cords; while a practical confirmation of this conclusion is furnished by the instance of a spinning mill, in which toothed gearing driving 18,000 was replaced by belts, with a saving of twenty per cent. in friction, or 31.2 per cent. on the effective driving power transmitted, and in no case do belts practically cause more friction than toothed gearing."

CAST IRON may be hardened as follows: Heat the iron to a cherry red, then sprinkle on it cyanido of potassium and heat to a little above red, then dip. The end of a rod that has been treated in this way could not be cut with a file. Upon breaking off a piece about half an inch long it was found that the hardening had penetrated to the interior, upon which the file made no more impression than upon the surface.

SCIENTIFIC PROGRESS.

What Makes Ice White and Opaque.

It is a law of light that in passing from one substance to another possessing a different power of refraction a portion of it is always reflected. Hence when light falls upon a transparent solid mixed with air, at each passage of the light from the air to the solid and from the solid to the air a portion of it is reflected; and in the case of a powder this reflection occurs so frequently that the passage of the light is practically cut off. Thus, from the mixture of two perfectly transparently substances we obtain an opaque one: from the intimate mixture of air and water we obtain foam: clouds and snow owe their opacity to the same principle: as also does the whiteness of crushed diamonds, salt, glass, and many other substances which are tranparent before the pressure is applied to them. Ice being, therefore, opaque and white in proportion to the amount of air it contains at the time of crystallization, it follows as a matter of course that anything which tends to expel the air from the water before it is frozen will contribute to its transparency when it assumes the solid state. If, for instance, water be boiled and kept from taking up air from the atmosphere while being cooled to 32 degrees, the result will be perfect transparency in the ice thus formed, whether the process of freezing be slow or rapid. The reason for this is that no air can exist in water in a boiling state. The same is true of perfectly filtered water similarly protected from the atmosphere. In case of ordinary water, which always contains a certain amount of fixed air, the ice made from it will depend for its color on the temperature under which it is frozen; and as this varies, neither ponds or rivers produce ice of anything like uniformity in this respect. Every ice dealer is aware that river ice, as a rule, is clearer and brighter than that of ponds or lakes; the reason being that the current in the river aids the crystallizing force to expel the air, which in still water, especially in very cold weather, is caught up and imbedded in the ice, thus affecting its color and, to a slight degree also, its density and durability. Against these advantages in favor of running streams we must put the larger yields in ponds, the lesser liability to damage from sewage, storms, and freshets, and though last not least, the increased quantity of oxygen and carbonic acid which make ice on ponds both more palatable and digestible than that of running streams.

Scientific Ingenuity.

An interesting little piece of chemical practice is to be found in the process for the removal of the stains upon the Liebig statue at Munich. The statue, which was set in place less than a year ago, is of marble, and its beautiful color tempted some dirty rascal to try and spoil it. For this purpose a liquid containing in solution permanganate of potash and nitrate of silver, two of the substances which produce the most ineffaceable stains upon cloth, was squirted with a syringe over the statute, covering it with black spots, which penetrated deeply into the soft stone. As soon as the injury was observed, competent chemists were set at work to devise means for repairing it. An analysis of scrapings from the surface of the stained marble showed the presence of silver and manganese, and the form in which they were employed was readily guessed, since the nitrate of one and the sodium salt of the other are the only soluble compounds of them in common use. "The nature of the stains being discovered," says the *American Architect*, "it was necessary to invent a method of converting the substances which constituted them into others which could be removed from the stone, and the experts resolved to attempt their transformation into sulphides, with a view to their subsequent solution and removal by the aid of cyanide of potassium. In order to secure the continuous application of sulphur necessary for the complete conversion of the spots, fire-clay saturated with sulphide of ammonium was plastered over them and renewed at intervals until the action was was complete. The paste was then removed, and the marble washed with pure water until all the alkaline sulphides were removed. Another fire-clay paste, saturated with a solution of cyanide of potassium, was then prepared and applied to the spots in the same way as the first. The sulphides formed in the marble were dissolved by the new reagent and the solution absorbed by the clay, and on the final removal of the paste the spots were found to be perfectly removed."

A NEW SCHEME FOR REACHING THE POLE.—We learn from *Nature*, of June 12th, that a new scheme of a polar expedition has been recently submitted by several officers of the Russian navy to the minister, Admiral Shestakoff. Starting from the idea that it is impossible to reach the north pole by sea on account of the archipelagoes that cover the circumpolar region, the Russian officers propose to start an expedition on sledges from the New Siberia Islands, which are nine hundred nautical miles distant from the pole. This space is to be covered by sledge-parties, who would make depots of povisions on the newly-discovered islands, and thus slowly but surely advance towards the north, securing at the same time the return journey of the expedition. When elaborated, the scheme will be submitted to the learned societies, and the necessary money raised by subscriptions.

A Smoke Stream

Mr. Sereno E. Bishop of Honolulu has added sixteen pages to the Krakatoa literature in a little paper on the 'equatorial' smoke stream from Krakatoa, in which he wishes to call more especial attention to a phenomenon consequent on the great eruption, that he thinks has not received sufficient notice. This is the "swift, strong fling from the eruptive column of Krakatoa of a vast stream of smoke, due west with great precision along a narrow equatorial belt at an enormous velocity, nearly around the globe." Commenting upon the above *Science* says: If the facts as here stated are fully confirmed, there will certainly be a remarkably rapid westward propagation of sunset effects to be explained; but the method of explanation suggested by Mr. Bishop is very unsatisfactory in assuming a limit to the atmosphere at forty-five miles altitude. Beginning with this unwarranted assumption, the author supposes that the volcanic gases, vapors, and finest dust would form a flat, conical accumulation over the point of eruption and above the atmosphere. Down the slopes of this flat cone, the gases would slide with accelerated velocity, but chiefly to the westward on account of lagging behind the meridian of eruption (the lagging is given as twenty-six miles an hour at an elevation of a hundred miles, but should be fifty-two miles an hour); and thus the rapid westward propagation of the sunsets can be accounted for. There can be no question as to the tendency to action somewhat in the manner here suggested; but whether this tendency will be fully realized is very questionable, unless decidedly greater elevations than a hundred miles were reached. The presence of some thin remnant of an atmosphere, even above a hundred miles, is demanded by observations on meteorites; and the condensation of volcanic vapors at that altitude would be very rapid. The neglect of these facts is a serious weakness in Mr. Bishop's theory.

FILTERING DISTILLED WATER.—Eiselt recommends the use of sponge for filtering distilled water. The filtration goes on with great rapidity, and the product is clear as crystal. When filtered through paper, distilled water soon exhibits a *felty* sediment, which is never formed when filtered through sponge, so that the bottles scarcely need cleaning after several months' use. The apparatus that he employs consists of a bottle with an opening near the bottom from which descends a bent glass tube. This tube is about 6 inches long and 1 or 1½ inches in diameter; at each end is a perforated rubber stopper bearing a narrower glass tube. The wide tube contains one or two long strips of fine sponge that has been cleaned with dilute hydrochloric acid and then dried. The bottle to which this filter is attached must not be larger than the one placed beneath to catch the filtrate. The sponge, of course, must be cleaned every few months.

A NEW TEXTILE.—Naturalists in Russia claim to have made a discovery in reference to the epilobium plant, which may revolutionize the cotton trade of Europe. The epilobium, more popularly known as the "willow herb," from the shape of its leaves, has hitherto been cultivated solely for its flower, which grows from the top of the pod. The Russian savants now claim that this pod can be made to yield a fiber possessing many of the valuable qualities of cotton fiber. In the experiments already made, this fiber has been ginned, spun and woven successfully on a small scale. An economic society in St. Petersburg has now petitioned the Czar to set aside some state lands for the scientific cultivation of epilobium and the continuation of the experiments for improving the fiber. It is claimed by some enthusiasts that the result of this discovery will be in time to avert the necessity for the importation of cotton into Russia.

A WANT SUPPLIED.—The *St. James' Gazette* says: "The need of an instrument whereby the hight of a star can be obtained when the horizon is rendered invisible by mist has been long felt in the navy; but a new apparatus, devised by M. Renouf, promises to supply the want. M. Renouf's device has been tried during a voyage to America on one of the Atlantic mail steamers, and all the observations were obtained with an error less than four minutes.

ELECTRICITY WITHOUT EXPENSE.—An extraordinary invention was recently exhibited by a Mr. Ferguson, in Lombard street, London. He claims to produce light and electricity from chemicals which after being used, are worth $25 per ton more than in their original state. The principal materials used are caustic, soda and zinc.

A NEW SALT.—From the decomposing masses of animal flesh Professor Briggs of Berlin has isolated a very violent poison, which analysis proves to be a hydrochloric salt of a new base, and which does not resemble any other known combination.

TIMBER AND HAIL STORMS.—A number of observations made in Switzerland, Italy, and in other places by Professor L. Glaser shows that the clearing of woods on mountain ridges has been followed by an increase of hail-storms.

Passing Events.

The spread of the cholera in Franee and Italy has had the effect of making the officials in all the large eities in this country take steps to purify and cleanse in every direction. As yet no cases have appeared in the United States, and every precaution of quarantine is being attended to strictly, so as to prevent, if possible, the disease gaining a foot-hold among us.

There is very little of special interest to report concerning mining matters. Few new investments are being made at preseut, owing to the prevailing dulness in mines.

There is trouble at the Panama Canal, and talk even of abandoning the whole scheme after all the enormous expenditure. Engineering difficulties uot foreseen have been encountered which will greatly add to the expense. It is said also that there has beeu reckless spending of money, of which the French bondholders are complaining loudly.

THE mines in the Patterson, or Sweetwater District are looking better than at auy time since they were discovered, and a stronger feeling of confidence in the future of that section of Mono county is existing among those most directly interested in the district. One mine, with but a little five stamp mill, has shipped upwards of $200,000 within a year and a half.

THE Ohio Miners' Association is said to be on the verge of dissolution, caused by internal dissensions.

Hydraulic Mining Still Active.

Notwithstauding hydraulic operatious have been stopped by legal proceedings in the more central mining districts of California, they are still being vigorously and sucessfully proseeuted along the rivers in the northwestern part of the State—more especially along the Salmon, Trinity and Klamath. On the latter the business throughout a stretch of more than a hundred miles is being carried on at intervals, accordingly as there are facilities for getting water on the ground, and is said to be in a more prosperous condition this year than ever before. The section of the river where the largest operations are in progress extends from near the mouth of Seott river down to Orleans Bar, having the old mining town of Happy Camp for a center. Here every few miles a hydraulic mine is to be seen in full blast, all running day and night, and some intermitting operations for not more than a month or two in the course of the year—no longer, in fact, than is necessary for cleaning up and making needed repairs.

Although the mines here do not make so large a produetion as did many of those in the central eounties when being worked, they can be outfitted for much less money, while they ean at the same time be run more ehcaply and steadily than the big mines farther south. These Klamath mines are said to yield iuvariably large profits, paying in all cases an annual interest on a fair valuation of 30 per eent, and in some of 45 or 50 per cent. Many of these properties were a few years since offered on the San Francisco and Eastern markets at very low figures. Finding no buyers, the owners have since gone on working them as before, and generally with sueh good results that they do not now care to dispose of them.

There are still, however, some good opportunities for investing money up there, the owners of gravel lands and water rights being, in some instances, willing to convey a large interest in the same to parties who would furnish money for building ditches and outfitting the the mines. Water in that region is very abundant, and generally short ditches suffice for bringing it to points where required for use, the supplying mountains in most places crowd close in upon the river and nowhere lie far baek from it. On the old Rood mine, uow owned by Allen Herald, of Oakland, 3,000 inches of water can be introduced through a ditch uot over one and a half miles in length. To bring that amount of water upon some of the large hydraulic mines on the San Juan Ridge in Nevada county, ditches over 60 miles in length have been required.

In this uorthern region most of the other conditions are equally favorable to hydraulic mining, such as freedom of gravel from pipe clay, hard cement, unwieldly boulders, voleanic cappings, etc., while the question of damage to farming lands, filling up harbors and shoaling navigable rivers cannot here arise, there being none of these exposed to he injured hy the debris from the mines. Though lying so far uorth the mines on the Klamath and Trinity are so little elevated above sea level that they can be run to advantage most of the winter, the ditches being seldom much impeded by snow or ice. This gives to the miner a long working season, the snow on the adjacent mountains, which are quite lofty, keeping the streams that head in them well replenished until late in the summer. Taken altogether the hydraulic mines along the middle Klamath may be considered not only the most eligibly situated, but actually the most prosperous in the State.

MR. FRANK H. FISHER is traveling in the hydraulic mining regions, eollectingr oyalty on "Little Giants," which were manufaetured by R. R. & J. Craig, a late decision of the courts being in his favor. Royalties collected are from $50 to $150 for each grant. The Trinity *Journal* says several thousand dollars have been collected by Mr. Fisher in that eounty, where there are more grants used than in any county in the State.

THE Ione Coal and Iron Company have had a large force of men prospecting for a new body of coal a few miles below Ione for several months past. They have located a deposit, where work will be eommenceed this month towards developing the same. The mine the company are working at present is shipping over a hundred tons daily, and perhaps will hold out for a year longer.

A New Amalgamator.

Patrick McElligot, of Bear Valley, Mariposa county, has just patented through the MINING AND SCIENTIFIC PRESS Pateut Agency an amalgamating device adapted for light and heavy work. On a suitahle foundation frame is mounted at an incline, a pan which may he rotated by proper means. The pan is mounted by means of a central trunnion, hollow, providing for a central diseharge into an underlying sluice. Friction rollers support the pan. Within the pan is an annular groove or channel formed hy a concentric screen. This screen is made in sections so as to be readily removed and renewed. The bottom of the groove is rounded out and provided with a suitable wearing-die.

Heavy metal balls lie loosely in the groove. These are covered with shoes for wear against the die. These spheres or halls, in counection with such parts of the machine as affect the result of pulverizing and discharging the ore, form part of a separate patent application now pending.

Within the sereen are tiers of annular bands, which are copper plates for amalgamating purposes. Each tier is made in sections, the end of one section overlapping the next, and this overlapping is primarily adjusted in such a manner, according to the direction of revolution of the pan, that there may be a fall from one to the other. These amalgamating bands have an inclination towards the center, and this inclination is suffieiently greater than that of the pan itself to make them slope downwardly at all points, even at the lowest, whereby there may be a fall to the center. They may be supported by annular rings set on edge. Around the inner circumference of the outer rim of the pan is secured an amalgamating ring or band, fixed at a point just above the line of the cirele of greatest diameter of the halls, whereby said balls do not touch it.

The operation of the machine is as follows: The ore and water are fed into the groove, and the pan revolved by gearing. The ore passes down to the lowest part of the groove, and there is pulverized by the aetion of the halls, which are set in motion, and continue rolling because of the revolution of the pan and its inclination. The fine pulp passes through the sereen at sueh points where it rises high enough, and the precious particles are amalgamated on the tiers of annular bands. It continually flows to the central discharge over the hands, and because of the revolution of the pan and the seetional overlapping of the amalgamating bands, it has a tendency to flow partially around, dropping off the end of one section on to another. Such of the precious metals as lie on the outer edge of the body of pulp are amalgamated by a circumferential ring of copper plates.

The Utah Mine.

According to the Secretary's report of the Utah Silver Mining Co., of Nevada, the income of $81,625 was mainly made up of four assessments of $20,000 each, during the year. Among the expenses, salaries and wages consumed $38,396; wood and lumber, $13,638; legal expenses, $5,514; water and ice, $8,366, and supplies $6,547. The Superintendent reports that since August 1883, when repairs to drifts and pipes that connect with the Silver Tunnel were completed, almost the whole year had been spent in running drifts in ground that has never been prospected before.

On the 1,350-foot level a good deal of work was done but no values were obtained. On the 1,650-foot level they found vein material of low assays, $3 to $5 per ton, hut the flow of water increased and work was stopped. On the 1,450-foot level the north lateral drift has been extended 112 feet. This drift was started at a point 200 feet east from the ineline station, and has been in vein material for the whole distance. No values by assays were obtained. Indieations of a heavy flow of water were met witb whieh made it unsafe to proceed further; therefore the work was diseontinued. The southeast crosseut, started at a point 200 feet east of the ineline station, is now out from the east drift 282 feet. It has been in vein material from the start, showing stringers of quartz and clay, but no values. The drift is being advaneed at the present time towards the company's south line. The machinery is in good working order, and all the openings are eonsidered in a safe condition for the passage of men and materials.

Speculation and Work.

Just now there seems to be a season of dullness in mining affairs, and in faet, in general business as well. The spirit of speculation, which a few years ago did so mueh harm on this coast, has been rampant in the Eastern States, and in a mueh worse form than was ever the case here. On this coast we had mining stocks only. There they have all the many railroad stocks and bonds, and various other forms of what are called "securities." During the past few months, millionaires, speculators, banks and corporations have lost millions of dollars on paper, and the shrinkage of values has affected thousands of persons. The result has been a lack of confidence and dullness in commerce and trade.

We feel the effects on this coast more or less, though having little direct interest in the "securities," which have lessened in values. Our trade connections, however, are so intimate with the East, that financial stringency there is always felt here.

In California, however, the era of speculation has passed. Mining stock no longer sweeps away the earnings and savings of poor men; railroad stocks and bonds are little thought of; puts and calls tempt us not, and wheat speculation is only done by men of means. We have, as a community, seen the folly of mere speculation, and settled down to business. Our factories are being enlarged; our home industries increasing in number; our lands are being settled up, and farms being cultivated. The people are at work. True, the city life attracts more than it should, and many throng to the metropolis, who would do better in the rural regions.

In another month, the grain crop will begin to move. Nature has returned a bounteous field this season, and the farmers expect large profits. We shall miss, however, our usual millions from the hydraulic mines, which are stopped by injunction of the courts. But the quartz mines are at work everywhere taking out and crushing ore. The depression is only temporary, and not due to local causes. The development of the resources of the State, its increase of population, the establishment of manufactories, and the cessation of mere speculative business, ought to bring California out all right for the year.

Simultaneous Firing of Blasts.

The blastiug arrangements adopted in a long stoue-drift or gallery at a mine in the St. Etienne district, in France are said to be very effective. The length of the gallery when completed, will be 770 yards; at present only about 50 yards have been driven. As it is desired to drive with all possible speed, light machine drills have been chosen for the boring and electric ignition of the shots for the blasting. The cables are carried up to within about six yards of the face of work and are protected by gas-pipes throughout a length of six yards. From the ends of these eables barc iron wire carries the electric current to the fuses, from ten to twelve in number. The firing machine is of the Siemens class, and is very compact and powerful. It is contained in a box of about one cubic foot capacity. Instead of the usual winch handle a draw-bar is used to give rotary motion to the armature. This bar is provided with teeth like a rack, and with a crosshead which the operator seizes with both hands, while holding the machine down with his feet. By such an arrangement great power may he exerted upon the armature. The machine is capable of firing a dozen shots with certainty. Misfires are of very rare occurrence. The simultaneous firing has in this case been found to save fully 20 per eent of the labor of boring.

THE BODIE MINERS' UNION has elected the following officers: President, A. A. Grant; Vice-President, Samuel Lynaek; Recording Secretary, M. O'Connor (re-elected); Financial Secretary, Wat. Morgan (re-elected); Treasurer, C. A. Nelson (re-elected); Conductor, W. H. Netherton; Warden, I. Newman; Finance Committee, Alex. Percy, C. L. Hayes, Hugh O'Harra, H. S. Keenan, John Dolan, Thomas Lenyon, Wm. Doublebee, John Pryor.

THE United States mints coined in June $4,227,885, of which $2,230,200 was in standard dollars, and $1,276,660 in $20 pieces. The coinage for the fiseal year, ending with June, aggregates $57,887,420. There was a decrease of over six millions in the gold coinage.

The "Five" Concentrator.

It is well known that many mines throughout the country are lying idle on account of incomplete methods for saving the precious metals in the ore. It is recognized also that millions of dollars have gone to waste at the mills on account of imperfect concentration. Having these facts in view, Mr. Ernest Koch, C. and M. E., has for some time been experimenting with various forms of concentrators, and has finally invented one which he calls the "Five," because it consists of a combination of five of the best concentrators in use. This he has just patented through the MINING AND SCIENTIFIC PRESS Patent Agency. The five principal elements may be enumerated as follows:

1. The circular table. This is in use at the mills of the Hartz mountain, to save fine sulphurets.

2. The riffle table, which is used all over California for saving gold.

3. The shaking table. The end-side shaking table is the most perfect and closest concentrator known. Still the shaking table works slowly, and the quantity of pulp which can be treated is small in comparison to other concentrators. This is the reason that the shaking of the "Five" concentrator has been placed on the bottom of the concentrator, by which the shaking has been divided on a large surface: consequently the "Five" concentrator, with the shaking on the bottom, will put through more pulp and work superior to the end-shaking table.

4. Side motion. The principle of Frue's concentrator.

5. Jigging table. The most perfect concentrator which has been invented at the mines of the Hartz mountain.

The Five concentrator will be more fully described and explained by reference to the accompanying drawings, in which Fig. 1 is a plan or top view. Fig. 2 is a vertical, central or cross-section. Fig 3. is a detail sectional view of the right angle iron fastened in notches. The circular or polygonal table Fig. 1, consists of eight table sections independent of each other, and arranged around a center.

This table-section (designated by *A* outside the circle) is formed of an iron frame *E*, with V-shaped notches. In each V-shaped notch, angle iron has been ribbed, so that the angle iron forms troughs *G* with slots *I* (Fig 3) in the bottom, the upper edges of the troughs forming the riffles *D* (Fig 1) on the tables. These slots are covered with thin sheet iron, in which small holes have been punched. Each table section is movable, fastened at the shaft *J* by a central ring *I*, and at *S* by iron rods, so that by lifting the shaft *J*, the circular table (Fig. 1) will raise.

Below these movable table sections, is placed a stationary table consisting of iron bars *E*, with chambers *B* below. The iron bars *E* are arranged in such a manner, that each right angle iron of the movable section tables *A* rest upon the upper edges of the iron bars *E*, which are beveled towards the center, and have small flat spaces along the upper edges.

The apparatus operates as follows:

By rotating, the cam *O* will raise the tappet *M*, vertical shaft *J*, and the circular table. As soon as the cam *O* has passed the tappet *M*, the suspended circular table will drop on the iron bars *E* of the stationary table, which produce a general knocking on the bottom of the section tables *A*. Arms or levers *P*, have their fulcrums near the shaft *J*, and their inner ends are connected with the shaft; while their outer ends have adjustable sliding weights *Q* to act as counter-balances and regulate the force of the drop. The iron rods *K*, have turn-buckles *L*, and by shortening one turn-buckle more than the other, one side of each section table will raise higher than the other by lifting the shaft *J*, which will produce a side motion at each section table.

If the holes *D* (Fig. 2) in the chambers *B* be closed with plugs, the water will rise, so that each time the upper table section is dropped, water will be forced up through the holes of the slots into the bottoms of the V-shaped troughs *G*, and produce what is termed a "jigging action." The tappet may be moved up or down on the shaft, to change the height of the lift and drop, and the rods *K* may be lengthened or shortened by means of the turn-buckles *L*, so as to change the grade of the tables. The fly-wheel regulates the rotation of the cam-wheel, and makes it easier on the belt. The pulp or tailings flowing from the battery are led through a trough, and are discharged through pipes *2* into the upper part of each table section. To each pipe a set screw is attached, to regulate the flow of the tailings; thence the tailings flow over the riffles *D*, (Fig. 1) formed by the V-shaped troughs *G*, and passing over the section tables. By means of the blocks on the bottom of the circular table, of the riffles,

Fig. 1.

KOCH'S "FIVE" CONCENTRATOR.

of the side motion and of the jigging motion, causes the heavier particles of gold, silver sulphurets and all precious metals gradually to settle to the bottom of the troughs *G*, and finally to pass through the slots into the chambers *B* below, and thence they may be discharged at will through the openings in the bottom.

The following advantages of the concentrator, among others, are claimed by the inventor:

1. The concentrator works closer and saves more precious metals than those of ordinary construction.

2. Different mines have different ore, and it is impossible to work different classes of ore on the same concentrator. This is the reason that the concentrator has been constructed in such a manner that any millman is able to regulate more or less "knocking," more or less grade, more or less holes in the slots, and to change the length of the tables according to the nature and size of the ore; and so soon as the machine is set right there is hardly any show to lose anything.

3. The concentrator is built simple and very durable in its construction, and any millman is able to do all repairing. This is a great advantage over the other concentrators, especially where machine shops are distant. Complicated machines are very troublesome to use.

4. As regards capacity, one concentrator is sufficient for a ten-stamp battery. One big concentrator is easier to handle, and will save room and power over several small ones.

5. There is no need of copper plates, though there is a more complete amalgamation of gold. Close the holes of the slots and fill the first few troughs of each section table with quicksilver to amalgamate the free gold. Hence there is no need of dry amalgam, and the amalgamator can put plenty of quicksilver in the battery, in stead of a few drops, as customary. The quicksilver will be better divided all over the battery; consequently the amalgamation of the gold will be more complete, with less loss of free gold.

6. The concentrator saves the heavy sand in the pulp, which is largely lost by the ordinary concentrators. The heavy sand consists of ore containing precious metals in a very fine state.

7. The machine is very simple in construction; consequently it is cheaply and easily manufactured.

8. The machine will save very fine sulphurets and precious metals. In the battery, until the hard quartz has been crushed to pass through the screens, the soft sulphurets, which are the richest, will be pounded to atoms. Anybody is able to prove the above with the horn by hand. If the tailings are washed in the horn by side-shaking, like Frue's concentrator, only free gold and coarse sulphurets will be saved. Still if the tailings are washed in the horn, and the horn knocked with the finger on the bottom, like the Five concentrator, all the precious metals of the ore will be saved.

9. The concentrator can be adjusted to save on the first part of the section tables fine products or clean sulphurets, and on the last part, raw products or half-clean sulphurets. It is an impossibility to work through a concentrator a large quantity and save all the precious metals of the ore, as fine products or clean sulphurets. Consequently it is a necessity to produce in the first a raw product or half-clean sulphurets, in order to save such a high percentage of precious metals as the Five concentrator yields.

The half-clean sulphurets will be worked again carefully to clean sulphurets on the concentrator, or else amalgamated in the pan.

The concentrator has been recommended years ago in the *Preussische Staats Zeitung*, by the Scientific Expedition sent to the Philadelphia exhibition by the German government; still it has been improved considerably since.

Mr. Koch is also inventor of an apparatus to center transits in mines by screws; and also of lead siphon in use with the system of kettles in desilvering lead by zinc. One of Koch's concentrators is set up at the Hendy Machine Works, 49 Fremont street, San Francisco, where it can be seen. Those interested in concentration can take small lots of ore there and work them themselves on the machine, so as to test its capacity and utility.

Technical Society of the Pacific Coast.

At the regular monthly meeting of the Technical Society of the Pacific coast, held last week at their hall, 413 Sutter street, three papers were read. The first was "On Retorting Silver Amalgam in Vacuo," by Fr. Gutzkow; one by Ross E. Browne, of University of California, entitled, "A Criticism of Becker's Theory of Faulting in Mineral Veins;" and one "On the Treatment of Torrential Sediment-bearing Streams in Europe, and its Application to California," by Geo. J. Specht, C. E.

Mr. Gutzkow described in detail, with model and drawings, an apparatus for retorting in vacuo. The appliance has been tested satisfactorily. It is an adaptation of another plant by the author introduced in 1868 in connection with his sulphate of iron refining process at the gold refinery formerly owned by the San Francisco Assaying and Refining Works. A number of these have been in use 12 years or longer. There is no patent on the plant, so anybody may use it. We shall give this paper after it has been published in the Society's proceedings.

The paper by Ross Browne was specially interesting to mining engineers, and is mathematical in its nature. Mr. Becker, of the United States Geological Survey, in a Government publication advanced some theories on "faulting" on the Comstock lode, which Mr. Browne takes exception to.

The paper of Mr. Specht is referred to more fully in another column of the PRESS.

A LARGE quantity of machinery for the cotton mills in Oakland is being discharged from the ship *Servia* at Vallejo-street wharf.

Nogales.

A Growing Mining Center.

Mr. Samuel Brannan, well known in this city, wrote to the *Alta* from Nogales as follows:

Nogales is situated half in Arizona and half in Sonora, on the line of the Sonora Railroad from Guaymas to the Southern Pacific. This road runs through a valley 500 miles long and thinly populated, and the time is twenty-two hours from Guaymas and ten hours from Tucson by stage. It is seventy five miles to New Virginia or the New Bonanza mines. Two opposition stage lines are running from Tucson to Nogales, $7 fare, just half the railroad charges, taking all the eastern and western travel. The town is one year old. The nights are cool enough for two or three blankets in the summer months. The altitude is 4,500 feet above the sea. In the daytime the thermometer stands from 60 to 90 degrees, and at night from 50 to 60 degrees during the Summer months. Vegetables can be raised twice a year. Fruits are very productive. All grains grow fine, and some crops produce twice a year. The same may be said of the whole valley. It is more of a Paradise hid than a Paradise lost.

Water is very abundant in this section of the country, and particularly in this place. It is easily obtained by digging from twelve to twenty-four feet. It is the best of water, pure and cold the year around. It is a fine location for manufacturing purposes, there being wood, water and coal in abundance; and being located on the line of the United States and Mexico, the place has both countries for a market. An iron foundry and a machine shop, manufacturing for mines in particular, would do well here. Iron and coal are found plentifully not far away. A flour mill would do well, there being a good market at home.

Windmills can be used during the dry season, when the trade winds prevail; and the wells are never known to fail.

Nogales is surrounded with the richest mines in the world—gold, silver, copper, lead, coal and iron—and is the outfitting station for the celebrated Sierra Madre Mountain mines, now no longer occupied by the Apache Indians, but free to all. These mountains are now open to the prospector, and there are no Indians to molest or interfere. The Apaches occupied these mountains since 1820, up to within two years past, and no one was able to visit them. Gen. Crook now has these Indians all corralled at San Carlos, on the reservation in Arizona. In 1820 was the time when they massacred all the Spanish miners and priests then located there, and four years before the Republic of Mexico was established. The old ruins of villages, churches, ditches, mines and arastras are still visable, the mines in particular. There are some twenty-five in the group, and there is also a mountain of horn silver, two and a half miles at the base, which at that day people did not understand how to work. Gen. Crook has left the way open and clear, and from this time further we may look for no more Indian rades to disturb the miner. They are too far north, should they jump the reservation, to do any harm. It is supposed at the time of the massacre that there was a great deal of gold and silver buried in the ground which will be discovered by the prospector. So far, these mountains have been a sealed book.

Two hundred mules with wagons loaded with silver ore arrived at this point lately, the ores to be shipped to Guaymas and from there reshipped East. Twenty-seven thousand dollars of silver bullion also arrived.

Cœur d'Alene Mines.

In speaking of the future of the mines, the *Eagle* says: The season in the Cœur d'Alene mines has thus far outstripped all the expectations that have been formed of the camp. It is not only demonstrated that gold is here, but that it is here in paying quantities. Gold in paying quantities has been found at every point on the main creeks where bedrock has been uncovered. Much of the work done on claims thus far has been mere prospecting work; on others the work is of a permanent character needed in the opening and development of the mines. An immense amount of dead work has already been performed along the length of Pritchard creek which will not have to be done over again. In order to open claims it is necessary to spend money with a lavish hand, and this has been done right along. The time is near when those claims will begin to realize on the investment. They will be in shape to produce, and once the work of production begins in a few claims the entire camp will feel the effect. The season has been one of many and peculiar discouragements to miners, but all along the creek we find a more cheerful view of things beginning to prevail. The camp is a certainty. The future of the mines are assured. After this summer it will settle down on the staple basis of its own merits. The placer fields will begin to reveal their true wealth, while the development of the quartz lodes, in which capital is already interested, will be quietly proceeded with. The irresponsible chatter of journalistic magpies in the played out camps of the west can do us no further injury, and the time is coming when the stern logic of facts and events will compel them to swallow every word they have uttered in villification of Cœur d'Alene.

For in spite of all the pains nature has taken to conceal her mineral wealth, the one plain fact is made apparent by the work already done that Cœur d'Alene is a great and glorious camp; that the boundless possibilities of its mineral wealth are but just beginning to dawn upon the minds of those who knew it best and longest. In spite of all that may be said to the contrary, Cœur d'Alene is the great treasure vault of the American continent.

Merchants vs. Miners.

A prospector writes to the *Colorado Miner* as follows: I note with pleasure your remarks concerning the co-operative system of mining in Gilpin county between the merchants and miners. This county has an abundance of first-class properties that belong to poor men who need but a little assistance to "strike it rich." To-day there is warfare going on in the county between the miner and the merchant, the former conjuring up some excuse whereby he can obtain ammunition and "grub," while on the other hand, the latter is devising means to collect his bills and prevent further credits. Now of course this produces hard times in our mercantile circles, and straugers and commercial travelers, hearing our merchants complain, take for granted that the mines have stopped yielding and that the county has gone to the devil, and where speaking of the county abroad, do not hesitate to represent things in that light, all of which is damaging to our prosperity, being badly advertised. Even our prosperous miners are also imbued with the idea of dull times, and instead of spending their money in town, send it East, or else deposit it in bank. They say to themselves. "this old suit of clothes will have to do me for a while longer, and I must cut down on my grub bill, for the town people say times are hard, and they ought to know."

This state of affairs would soon cease if the Gilpin county plan was put into execution, for the merchant would become a miner, and the miner, as his partner, would work harder and more cheerfully, feeling that he had the interest of others at stake and no bills coming due. The merchant, as a miner, would have no time to complain of hard times, and the miner would be constantly at work, and the county would not have to depend upon the output of companies or lessees, but everybody would be directly interested in mining, and therefore become producers.

Denver's Ore Market.

Looking at Denver as an ore market, there is, perhaps, more encouragement for the future of this city in our rapid growth as an ore market than in any other fact of the present situation. The amount of ore brought here for sale has been steadily increasing during the last few years without exciting a great deal of attention. What is better, and what is full of hopeful significance, is that the area of mining country from which this ore comes has been constantly enlarging. It is drawn in greater or less quantities not merely from all parts of Colorado, but from Montana, Idaho, Arizona, New Mexico and old Mexico. In short, it comes from the entire region which we ought to be now occupying with our commercial agents, and to which we should be distributing our goods. For these ores we ought to exchange the necessities of life, instead of paying for them in cash.

The quantity of ore daily brought into Denver by the railroads cannot be accurately given, but it is estimated to average all the way from 700 to 1,000 tons. This is the equivalent to from 70 to 100 carloads per day, and is of itself enough to constitute a considerable business. Those conversant with the subject, predict that a few years hence the city will receive an average of 5,000 tons a day. Not only will the mining localities now shipping to us increase their output, but many mining camps which we do not get will come to us. Rail rates will become more favorable, and country smelters, with their inadequate plants, will gradually die out. A further resource is the almost certain discovery of new deposits within the territory now patronizing us.

Half a dozen years ago, various kinds of works for the treatment of ores were scattered all over the State. Most of them were inconsiderate experiments, and the best and most successful labored under the disadvantage of being particularly confined to the ore produced in its immediate vicinity. Now it is an established fact that a great smelter can only succeed where the ores of a variety of widely separated mines can be had, so that they can be mixed to produce the most profitable results. This advantage overcomes any possible saving in transportation, and naturally locates the smelter at the center of a railroad system radiating into the mountains. Another fact which appears to be in process of demonstration here is that small smelters, even at an ore market like this, cannot compete with large ones. It is contended that instead of having a number of new but small smelters we will have, from time to time, enlargements of the large ones, such as is now taking place at the Grant smelter. Smelting men admit that there is a field in Denver now for a big smelter with $1,000,000 capital, whereas ten smelters with $100,000 capital each might all fail from inability to compete with Grant and Argo.—*Denver Tribune.*

The Origin of Coal.

Is It Derived from Petroleum?

The discovery of vegetation in bituminous coal caused Lyell and other geologists to assume that coal was vegetable matter condensed and carbonized by chemical action under pressure, while protected from atmospheric action by a covering of water caused by the subsidence of the earth's surface during the carboniferous era. We owe so much to the pioneers in scientific discoveries, and have so much admiration for the zeal and patience which examines and elucidates facts to increase our knowledge, that we feel grateful for the gifts received; but there is one characteristic of the followers of great men which is not praiseworthy. It reminds us of what we sometimes see in the crossing of streams—animals fastened together, the tail of the first tied to the head of the next, and so on to the end of the procession, in which no follower leaves the trail of its leader, and the correctness of all depends on the exactness of the one who leads. We appreciate the virtue of fidelity, and yet reverence truth. This explains why we leave the trail.

A Similarity of Elements.

Humboldt, in his "Cosmos," remarks: "It must, however, be remembered that the inorganic crust of the earth contains within it the same elements that enter into the animal and vegetable organs." The chemists have demonstrated that all matter can be reduced to a few elements, and these combined in different proportions form every object we know, including the planet on which we live, as also the air we breathe. That a similarity of elements combine in wood and coal is not surprising; but we do question the absolute identity. The difference in ash of vegetation and coal proves this conclusively, and a careful analysis of known liquid products obtained from vegetation in approximate quantity as compared with petroleum, will prove petroleum to be inorganic matter, and not a vegetable product.

Various Observations.

Dana describes petroleum as composed of carbon and hydrogen, and adds, "When the oil is afterwards exposed to the air it often oxidizes and becames thick, and finally solid, passing ultimately to asphaltum or some analagous compound." Humboldt, in his observations of nature as a whole, suggests to us even more than his wonderful industry demonstrated. Thus in Cosmos: "I would instance the Saarbucker coal measures where 120 beds are superposed one on another, exclusive of many which are less than a foot in thickness." He also states that "the coal beds at Johnstone, in Scotland, and those in the Crenzot, in Burgundy, are some of them respectively 30 and 50 feet in thickness, while in the forests of our temperate zones the carbon contained in the trees growing over a certain area would hardly suffice in a hundred years to cover it with more than a stratum of seven French lines in thickness." Humboldt, in his "Aspect of Nature," refers again to this estimate (seven-twelfths of an inch), as Chevandier's calculation. The perfect preservation of fragile plants and insects found in coal, and minutely described by Lyell, Richardson, Mautell, Dana and others, is analagous to the known preservation of plants and insects in amber and gum copal. We quote: "The preservation of sharp angles of numerous stems of plants known to be of a soft, juicy nature, with the surface of the sigillariæ, especially marked with lines, streaks and flutings so delicate that the mere drifting of a day would have inevitably destroyed them." The impression forced on the mind in this case is nearly a conviction that these objects found in coal were suddenly excluded from air, and decay arrested, under conditions identical with similar substances preserved in gum copal. In "Orr's Circle of the Sciences," Vol. VII, p. 462, it is stated that "100 parts of Bathgate coal will yield about 40 of oil which is fit for machinery, and 10 of parafine. Brown has obtained same products from bituminous coal and bituminous schists by similar process of distillation." The presence of sulphur in larger proportions in bituminous coal than is found in vegetation also suggests the incorporation with petroleum while in a fluid state. The "horses," so called by miners, closely resemble islands surrounded by coal. Le Conte ("Elements of Geology," p. 173) states that coal strata thin out at the edges. The trunks of trees projecting through veins of coal, and often petrified where not incorporated with the coal, compels a dissent from the theory that the tree first caused the petroleum.

Conclusions.

The unwillingness to consider petroleum as *primordial, with sulphur and salt, can be best illustrated by Humboldt's remark: "The pertinacity characteristic of error."

Education suffers in proportion as people are compelled to unlearn what, as children, they acquired by hard study.

Students of Nature are not always book-makers, but a book-maker who will not observe Nature, may perpetuate error, when his duty as teacher should urge him to seek the truth.

The proof that coal is fossil bitumen is perhaps too plain and simple to please those who have adopted the elaboration of coal and petroleum from wood or peat, supported by arguments of intricate ingenuity. But an investigation will determine the truth, and we cheerfully strive to aid this resolution.—*E. E. C. in Denver Republican.*

*We do not mean that the elements of petroleum are not classed as primordial, but object to the conclusion that vegetation must first combine them to produce petroleum or coal.

†LeConte's "Elements of Geology," p. 367, gives less than two-thirds of an inch of coal as the equivalent for a vigorous growth of vegetation of one hundred years.

Simultaneous Blasting in Mines Without Electricity.

The advantages of simultaneous ignition of a number of holes under a great variety of conditions is almost unanimously admitted among practical men. The problem has long been how most safely and economically to effect it. It was soon discovered that the steady and useful old safety-fuse could not be depended on for this particular class of work. Resort was then naturally had to electricity, and it is not denied that in expert hands and under favorable conditions admirable results have often been obtained by Abel's and Brain's electric fuses fired by dynamo and other exploders.

The difficulty has hitherto been, and will probably still be, to get the scientific apparatus carefully and accurately handled by the ordinary miner under the awkward circumstances of the wet, dirt and darkness of underground. The practical result has often been found to be that after the considerable outlay required on exploders, cables and electric fuses, the complete circuit of charges is not exploded, and thus, though theoretically most perfect and safe, there still remains the element of uncertainty and its accompanying danger. To meet this difficulty, Messrs. Bickford, Smith & Co., Tuckingmill, Cornwall, have introduced their patent igniters and instantaneous fuses, which are fast getting into favor in lieu of the more expensive electrical blasting in the majority of operations where simultaneous ignition is desired. This new method is so simple that a simultaneous blast of any number of holes can be arranged and effected by the ordinary miner without the technical knowledge of the appliances and careful handling necessary for producing the electric spark.

The advantages claimed for these igniters will be at once apparent to the practical operative, from the fact that each igniter is complete in itself, and is issued by the makers ready for use, with the necessary instantaneous fuses attached for any given number of holes to be instantaneously blasted, whether in dry or damp soil, or subaqueous work. The well-known Bickford safety fuse being inserted for conveying the fire to the explosive disc at the point of junction, is lighted in the usual way, and the unfailing result is a simultaneous blast of all the charges. It will be seen that no machines or cables or wires require to be manipulated, but the simplicity and comparative economy of the self-contained igniter are gradually introducing simultaneous blasting where other means had been unsatisfactorily tried.

The invention has been subjected to several tests and experiments under various conditions, with the greatest satisfaction and success, and those most competent to judge have pronounced it to be a simple, sure and cheap means of "volley" blasting. Many instances of successful trials with these goods might be cited, but perhaps as valuable as any in favor of these appliances is that of Mr. MacRoberts, chief chemist to the Nobel's Explosives Company, who says, in a report he made in 1880, that he had tested the instantaneous fuses with very excellent results. "Both to the eye and ear the explosions were perfectly simultaneous." In Mr. Robert's opinion, blasting with fuses of this description is superior to electric blasting, and, he adds: "One of the set tried contained no fewer than twenty-three instantaneous fuses, each nine feet long, tied into one igniter. I had them filled with twenty-five double detonators. All went off, and the explosions sounded as one; so that, had these fuses been used in blasting twenty-five holes, there would have been an instantaneous blast of the twenty-five. All others tested exploded simultaneously, so that there can be no doubt that Messrs. Bickford, Smith & Co. have completely attained the object aimed at in these fuses." Better evidence could hardly be desired, but if more is needed it can be found in the fact that the value of these inventions have invariably been recognized whenever the fuses have been shown at the great scientific and other exhibitions at home and abroad. Wherever exhibited first-class prize medals have been awarded them.—*London Mining Journal.*

Technical Education.

At the annual meeting of the governors of the City and Guilds of London Institute for the Advancement of Technical Education, on March 19th, the Lord Chancellor, who presided, in moving the adoption of the report, said that the buildings of the central institution were now nearly completed, and it was expected that they would be publicly opened in June. The arrangements in connection with the work to be carried on there had now, to some extent, been made. It was proposed that four principal professors should be appointed in connection with the central institution—viz: professors of chemistry, of engineering, of mechanics and

mathematics, and of physics, as well as a proper staff of administrators and assistants, the whole to be superintended by a board of studies. Laboratories, properly fitted up, workshops, and drawing offices would be made use of with the view of giving instruction which should combine the elements of those fundamental studies which underlay the technical arts with practical work itself, and it was hoped they might in this respect be able in some degree to improve upon those models with which the experience of the Continent had furnished them. An entrance examination would be imposed on the students to make it certain that they had had sufficient elementary preparation in science, mathematics, modern languages, and drawing, and those who did not obtain exhibitions would pay the moderate fee of £30 per annum. It was hoped that as time went on the number of exhibitions and scholarships which would enable poor but clever and meritorious students to obtain the benefits of the institution would increase. A generous beginning had already been made by the Clothworkers' Company, who had granted three exhibitions of £60 pounds each, tenable for two years, but capable of prolongation to three years. It was assumed that £9,000 might be found sufficient for the purpose of maintaining the institution, and the council hoped they would not be too sanguine in expecting £2,000 per annum in fees from the students, which would give them £11,000 altogether, allowing for the gradual process which must take place until the students obtained their maximum number. When there were as many as 150 or 200 students the fees might be reckoned at about £5,000, and this would supply half of the £9,000 which was mentioned as the probable expense of maintaining the institute in full working order. As to the Finsbury College and the South London School of Technical Art, both showed an advancement in regard to the number of students and to the amount of work done upon what was accomplished in the previous year, although in both, if the means were forthcoming, it would be desirable to extend the work. Nothing could be more striking and satisfactory than the progress of the work of the institute in connection with its technological examinations, by which it diffused its influence over the whole community in the United Kingdom. The candidates presented for examination last year were 2,397, being an increase of 425 over the former year, while those who had passed numbered 1,498, showing an increase of 276, and the number of centres had increased from 147 to 154. What was still more remarkable was the rapid extension of the desire to have these technological examinations, for they were now preparing for them 5,862 students, being an increase 1,814 upon the numbers of the previous year. Owing, he believed, to the influence of the institution, classes had recently been established in 102 different parts of the United Kingdom. With regard to finance, it was satisfactory to find the institute had strictly adhered to the lines they had laid down, and the council claimed that their estimate had in substance been fulfilled. If they wanted more means, it was not through any excess or folly of theirs, nor through any unforseen cause, but through causes which had from the beginning been presented to the minds of those interested in the work. There was an expectation that the cost of the building of the central institution would be greater than £75,000, which was the estimated sum. At the same time, an additional £20,000, not included in the estimate, would be required for the fitting up of the building. There was a deficit of £1,240 in the building fund, so that altogether the amount required for completing the buildings would be about £21,000. He recognized with great gratitude the liberality with which hitherto the institute had been supported by the city and by most of the guilds of London, but he could not help thinking that, having done this good work, and having every reason to be satisfied with its results, they would be ready to help it still further. He might say that the Skinner's Company had, since the printing of the report, increased their subscription from £500 to £1,000, and their donation to the building fund from £2,000 to £3,000, while Mr. Hooper, a manufacturer, of Westminster, had promised to give £100 towards the first £1,000 required, provided that the remainder were provided by nine other manufacturers. These facts ought to be taken as examples by the great city of London and by the city guilds, who had been such a great support to the work hitherto, and who, he hoped, would continue till all of those present at the meeting were in their graves, to be associated with it.

THE SILVERADO.—The Silverado Company is pushing things in Sweetwater. There are now fifteen men working in the mine and a number of men who are also employed making a trail from the mine to the mill. Mr. Downing is hurrying everything as much as possible, especially in the mine in order to get out ore enough to meet the demands of the mill. Rapid work is being done on the mill, extra mechanics having recently been employed and it is expected that it will be finished by July 1st.

THE hoisting works on the New London mine at Mojave, are finished and steam was up last Thursday for the first time. Everything worked like a charm under the supervision of that boss machinists L. J. Lassell. This mine has been employing thirteen men, but the force will now be doubled and the mine worked night and day.

USEFUL INFORMATION.

Italian Methods with Lime Mortar.

A correspondent of the *Builder* gives a few details of the Italian method of making and using lime mortar which are new to us, and of considerable interest, as are nearly all the particulars of construction as practiced by these skilled workmen. In the opinion of the *Builder's* correspondent, most of the modern Italian processes are identical with those practiced in the same country by the ancestors of the present inhabitants 2,000 years ago; and he believes that the good quality of the Roman mortar, which has been proverbial for centuries, belongs equally to that made every day in Naples or Perugia.

As every one knows, the custom among the Italian masons is, on commencing work upon a new building, to dig first a pit large enough to contain all the mortar required for the work, into which is put lime enough to fill it, within a foot or two of the top. Water is then poured in until the pit is filled, and the mixture is left to itself, care being taken only to add water as that first put in is evaporated or absorbed. As mortar is wanted, a portion of the lime is taken from the mass, but the lower portion, which will be used to mix with the plastering mortar, remains undisturbed for years and acquires a smooth, pasty quality much prized by the Italian architects, who place a value upon the lime which they use for such purposes proportionate to the length of time which has elapsed since it was first slacked. The good effect of this mode of preparation is seen in the perfect stability of the mortar, which never swells or cracks, and when used in brick-work or stone masonry, is never observed to give rise to those disfiguring efflorescences which are almost inevitable with us. On plastering mortar thus made there is no difficulty in laying the fresco colors which are used in Italy with such splendid effect, but which burn out into pale and unsightly patches when laid upon our raw, half-slacked mortar.

With lime treated in this way work can be executed which would be impossible with such materials as we employ. As an instance of this the correspondent of the *Builder* quotes the *battuto* roofing, which is constantly used to cover costly and important buildings in southern Italy, and which consists simply in a thick coating of lime mortar spread over the timber-work and beaten continually with heavy clubs for ten days or two weeks, in order to consolidate it. The climate of southern Italy is rainy, if not cold; but these roofs, which, if made of what we consider good lime-mortar, would transmit water like a sponge, serve there to protect for centuries the house beneath. The same kind of work is used for floors, taking the place which would be filled among us by cement-concrete, and the beaten lime floors appear to be as hard and smooth as anything that we construct with much more costly materials. That this difference in quality between our own and the Italian mortars is due to the mode of treatment rather than the original character of the lime used, is indicated by the fact that many different varieties of limestone are employed there, according to circumstances of localities or convenience, without any material variation in the result, the Italian workmen having learned that art which we care so little for—the making the best of poor or indifferent materials.—*American Architect.*

TO DETECT TAINTED CANNED GOODS.—Dr. J. G. Johnson, of Brooklyn, has given the following rules as aids in detecting unsound or tainted canned goods: "Every cap should be examined, and if two holes are found to have been punched in it take the can immediately to the Board of Health with its contents and give the name of the grocer from whom it was bought. Reject every can that does not show the golden line of resin around the edge of the solder of the cap, the same as is seen on the seam of the side of the can." The absence of this indicates that the sealing was effected by the use of muriati acid, the doctor claims. "Reject any and every can that shows any rust around the cap on the inside of the head of the can. Reject any that does not bear the manufacturer's name. Before buying press the bottom of the can up, and if the contents are decomposed, the tin will rattle like the bottom of the oiler of your sewing machine. If the contents are sound, the bottom will be solid and impossible to push up."

GLASS BEARINGS.—Bearings made of glass are now being experimented with in the rolling stock of railroads in regard to their frictionless quality. This material is a hard, clear substance, and must wear down smooth and give a fine bearing surface for an axle to rest upon. It is a non-conductor of electricity, if not of heat, and the fine particles have as good a chance to work down the bearing of the axle to a running fit as in the grinding in of a valve seat for a brass valve, and much power is expected to be saved by converting the wearing of a journal into some other agency than by converting it into heat.

BAY WINDOWS FOR CARS.—Five bay windows on each side will be a feature of the new parlor cars now being built for the Pennsylvania road. They do not project beyond the sills, but the space between them is set in towards the center of the car, enough to give the bay effect, without noticeably intruding upon the space. The width of each bay window is seven feet, two inches, consisting of a central window three feet wide, and two wings, deflecting slightly in opposite directions, which are each two feet, two inches wide.

HOW TO AVOID SMOKE FROM FURNACES. The following simple method for the consumption of smoke is given by a German exchange: Start the fire as usual and let it burn until the coals are in a bright glow; then rake the coals on the grate to the right and left, so as to form an empty space along the middle, and put the fresh coals into this space. The smoke which is formed from the fresh coals is consumed by the glowing fires on either side. If the grate is very wide, two such open spaces in the fire are advantageous for the addition of fresh coal.

COPPER ROOFING. A contemporary says that no limit can be placed to the life of a building roof made of copper sheathing, which costs at this time not more than double the price of tin, that has to be painted every year and wears out in a few years. No material is known that is as cheap and durable as copper sheathing for roofs of houses. There are several old buildings in this country that were covered with copper eighty and ninety years ago, and the roofs to day are as sound as when first put on.

TRAP DOORS IN THE ROOFS OF CARS.—It has been recommended in the report of a special railroad committee, that trap doors be placed in the roofs of passenger cars, and that hereafter all passenger cars be so constructed as to have an opening in the roof, the cover of which can be removed in case of accident, as may be required. The report was accepted and the committee was continued, with a request to furnish plans for the proposed change at the next meeting.

TO DETECT INFERNAL MACHINES.—M. de Fonvielle has suggested the following method of detecting infernal machines: All luggage to be placed on wooden tables, supported by iron feet, but not nailed to them. A microphone to be placed on each of the tables, when any ticking or other noise proceeding from the luggage would at once become audible.

METALLIC PAPER is a French invention, and upon it chromo-lithographs are rendered transparent by a coating, and backed with tin foil. The effect is said to be very striking, and the possible applications of the invention are very numerous and useful.

BRONZING.—It is asserted that articles of iron or brass may be brouzed by dipping them into melted sulphur, mixed with lamp-black. The surface, after being drained off, will take a beautiful polish, and presents the appearance of oxidized bronze.

GOOD HEALTH.

The Teeth of the Future.

In an able address recently delivered, Mr. Spence Bate, F.R.S., has drawn attention to some remarkable features, which it may be interesting and instructive to take into account. In the teeth of the Esquimaux, the Red Indians, and the natives of Ashantee, as well as those found in the ancient barrows of England, the so-called interglobular spaces, seen so frequently in sections of modern teeth, appear not to exist; nor, indeed, are they to be detected in the dentine of the best developed structures of the modern European. Not only is the dentine getting deteriorated, but the enamel would seem likewise to be undergoing a modification—becoming too opaque. In addition to the histological changes, the external form and character of the teeth are sustaining an alteration. This seems to be in relation to an important feature in the history of their evolution.

The tendency for the cranium to develop at the expense of the face and the jaws is seen to occur as we ascend the scale of the vertebrated series of animals. Owing to this atrophy of the jaws, the proper space for the full play and development of the normal teeth would seem not to be available. At birth, the bones are not sufficiently grown to receive the teeth in their normal arch; and, as in the human mouth, the premaxillary bones are firmly united a short time after birth, it follows that the posterior part of the jaw is the only place where growth can occur. Any delay in the development and consolidation of the symphysis must have the effect of contracting the space required for the teeth at this site. In the course of vertebrate evolution there is a marked tendency for teeth to disappear. The lower vertebrates have four molars on each side in each jaw, the higher have three, while in man the number is reduced to two.—*The Lancet.*

[The inference is, that teeth are being gradually evolved into brain matter, and as man increases in intellect, his masticators become unnecessary. The future man will have a large brain, but no natural teeth. He will have to depend on the mechanical dentist.—EDS. PRESS.]

TURPENTINE IN INFECTIOUS DISEASES.—The *Medical Record* tells us that H. Vilandt writes in the *Ugeskrift for Ledger*, concerning the value of the oil of turpentine in the treatment and prophylaxis of diphtheria and the exanthematous diseases. He states that he has never seen any of these diseases spread from a sick child to other members of the family when this remedy was employed. In many of his cases no isolation could be attempted, as the mother was the only female in the family, and was obliged to take care of both the sick and the well, continually passing back and forth from one to the other. His method was to pour from twenty to forty drops of a mixture of equal parts of turpentine and carbolic acid into a kettle of water, which was kept simmering over a slow fire, so that the air of the sick room was constantly impregnated with the odor of these two substances. He claims also that by this means a favorable influence is exerted upon the exudation in diphtheria, although it is by no means curative of the disease, and should never be relied upon to the exclusion of other remedies.

TOBACCO AND THE PULSE.—Dr. Troitski, says the *Journal de Medecine de Bruxelles*, has made a number of observations upon the effects produced on the temperature and pulse by smoking. He found that in every case, varying according to the condition of the individual, there was an acceleration of the pulse rate and a slight elevation of temperature. If the average temperature of non-smokers were represented by one thousand, that of moderate smokers would be one thousand and eight, and while the heart in the former case was making one thousand pulsations, in the latter it would beat one thousand one hundred and eighty times. It is in the latter effect that he thinks the danger of tobacco-smoking is manifested.

PREPARING TO BE DUMPY. Women, especially those of the upper classes, who are not obliged to keep themselves in condition by work, lose after middle age (sometimes earlier) a considerable amount of their hight, not by stooping, as men do, but by actual collapse, sinking down, mainly to be attributed to the perishing of the muscles which support the frame, in consequence of habitual and constant pressing of stays and dependence upon the artificial support by them afforded. Every girl who wears stays that press upon these muscles and restricts the free development of the fibers that support them, relieving them from their natural duties of supporting the spine—indeed, incapacitating them from so doing may feel sure that she is preparing herself to be a dumpy woman.

BURYING ALIVE.—A paper recently read before the French Academy of Medicine expressed the writer's conviction that one in every 5,000 persons is buried alive. This estimate, however exaggerated, is not calculated to allay an apprehension which is conspicuous among the French people, and which was lately brought to public attention by the declaration of the President of the Chamber of Notaries that express instructions are given in one will out of every ten to have the heart pierced by a qualified surgeon before the lid of the coffin is screwed down.

REMEDY FOR WARTS. Those who have not faith sufficient to utilize any of the numerous magical methods of curing these annoying blemishes, may try the following: Iodine (crystals), one-half dr.; acid, carbolic (crystals), two dr.; alcohol, twenty-four drops. Scrape the wart as much as possible without causing it to bleed, then apply the remedy carefully by means of a pointed stick. Scrape again, and so repeat as long as possible. Nearly the entire excrescence may be gotten rid of at a single sitting in most cases.—*Good Health.*

HOT MILK.—The hot water cure has its value, and many have been benefited by it. The hot milk cure is of more recent origin, and for exhausted conditions to be preferred. The temperature should be as high as can be sipped in small doses with a teaspoon. Its good effect comes quite quickly; indeed, more quickly and more permanently than the effects of alcohol, to which it is greatly superior. Women should use it in preference to hot tea, for its heat is quite as beneficial, and it has no injurious effects if used properly.

A HINT FOR THE SICK-ROOM.—Impregnation of the atmosphere of a sick-chamber when the patient is ill of diphtheria, measles, scarlet fever, or of any allied disease, with the odor of a mixture of equal parts of turpentine and carbolic acid is recommended by Dr. Vilaudt. Half a teaspoonful of the mixture will be enough at a time, if it is put into a kettle of water kept near the boiling point. The odor generally gives some relief to the sufferer, and tends to prevent the spread of the malady.

ONE-SIDED CHILDREN.—The bodies and heads of children are sometimes distorted because the mother or nurse carries them to much on one arm. This is almost sure to be the case if the mother can nurse them only from one breast, as now and then happens. Mothers may correct this by changing the child's position frequently, and this her love for her child will prompt her to do if she knows how important it is.

VASELINE IN SCARLET FEVER.—Dr. J. B. Johnson, of Washington, recommends the use of vaseline as a local application once or twice a day to remove the itching and burning sensation caused by the eruption in scarlet fever,

MINING SUMMARY.

The following is mostly condensed from journals published in the interior, in proximity to the mines mentioned.

CALIFORNIA

Amador.

SOUTH SPRING HILL.—Amador *Ledger*, July 12: The first clean-up since the mill resumed work was made last week, and realized a trifle over $6,000 for the month's run with ten stamps—a result fully as satisfactory as previous runs. The mine looks as well as ever. A road is being made to enable teams to travel between mine and mill more readily.

Calaveras.

WEST POINT.—Calaveras *Chronicle*, July 12: Our mining interests are steadily improving. Quite a number of quartz speculators and mine owners are visiting in this place. It is rumored that they are here for the purpose of purchasing mines, if they can get them at a reasonable rate. If it is possible for them to get a few of our good quartz mines started it would greatly improve the business of this place.

JOTS.—The south level of the Scorpion mine is still being driven ahead to connect with the south chimney of rich rock which lies 150 feet south of the present working shaft. The Lockwood mine will soon be in operation again under the management of Messrs. Russel & Shivers, who are at present prospecting it. This mine has spoken for itself in the past and will do so again in the future. G. Eberhardt & Co. have been making a chamber in the tunnel of the Blazing Star mine, preparatory to sinking a good working shaft on the lode. The Bismarck mine is being worked by Otto Mentzel & Co. Thelledge is over two feet wide; 20 tons of ore, lately crushed paid $40 per ton. Messrs. Rowe & Jenkins have a full force of men at work on the Henry mine, and are taking out good rock; about 60 tons now on the dumps. Work has been resumed on the Mitchell mine by Mr. Haskins, who has struck some good pay rock south of the old working shaft. He contemplates soon to put up machinery to handle the water, which has been the trouble in the past. Messrs. Johnson & Smith have struck a good vein, about two miles from town, which prospects well. Mr. Clark is working his mine at Sandy Gulch with Chinamen. Messrs. Shives & Russell have a force of men digging a ditch to carry water from the Middle Fork to their reduction works on Bear creek. The Wide West mine still continues to turn out good quartz; depth of shaft 85 feet; width of vein 2½ feet; 40 tons of quartz on dumps.

THE BLAZING STAR MINE.—The Blazing Star mine is about 1¼ miles east of the town of West Point, and is bounded on the north by the Old French lode, on the south by the Tom Payne mine, on the east by the Pride of Bummerville, and on the west by the Matrimonial claim. It was first discovered in the year 1862 by P. Joyce and partner, who worked it for awhile with good results and then left it. Shortly after, Mr. Kincaid and others worked it for a short time and then abandoned it. Finally Messrs. Crosby, Ham and Herbert struck a rich chimney of quartz, and after working it to water, sold out to Messrs. Wickham & Gouldson, who developed the mine thoroughly by tunnel and shaft, receiving handsome dividends for their labor. After placing machinery on the mine Gouldson sold out to his partner, who worked it successfully for over a year, reaping a golden harvest. The owners concluded to quit it for awhile and perhaps in the near future to sink a new shaft with other machinery, but they never did so and in due time the shaft caved in to the surface of the ground. The mine was afterwards bought by G. Eberhardt, who has worked it successfully up to the present time. His present works are 150 feet north of the old shaft on a chute of decomposed quartz, 2½ feet wide, which prospects splendid.

Inyo.

THE GREENLY MILL.—Inyo *Independent*, July 12: Messrs. P. A. Chalfant and Geo. Thorpe are just in from Deep Spring district, where they have been engaged in constructing, and for the past month, in running the above named mill. Mr. Chalfant informs us that while some of the ores worked did not clean up to the big figures hoped for by the boys, not a single lot, worked from four different mines, but gave a fair margin of profits. Although not a single ton but was worked as it came from the mine—without any sorting whatever. With the exception of one small lot, the ores put through worked remarkably free, the only appliances at present in use at the mill for saving the gold being a complete set of fine amalgamating plates. In due time other appliances, particularly a concentrator, will be added, for use on both the gold and silver ores of the district. Mr. Chalfant says that while he does not claim to know of any wonderfully rich mines in the district, he does know of many that will as certainly pay a fair margin of profits as those that are worked, as most of them will be right along. At present he is confined to his bed by sickness, but barring delay on that account will, together with Mr. Thorpe, return immediately.

POLITA.—Mr. Wm. Irwin, Superintendent of the Polita mine, near Bishop creek, has now a force of seven men at work on the property, and will put another gang on in a few days. He says that if there is anything in the mine he will find it. He has been making arrangements to have the ore worked in the Hawley mill. From 600 to 800 tons of ore on the dumps, and work will be pushed in the mine.

NEW DISCOVERY.—It is reliably reported that there has been made recently a discovery of a large deposit of lead and silver ore about four miles easterly from the town of Keeler. The deposit lies at the southwestern end of the Buena Vista mountain, on which the celebrated Union Consolidated mine of Cerro Gordo is situated. The indications are that this discovery is of large extent and of good quality as to ores. The fortunate discoverers and owners are Nat Randall and W. R. Johnson.

INDEPENDENCE MINE.—Messrs. Wilson, McKenzie, Willis and Jerry Fitzgerald are getting out a lot of ore at the Independence mine at Darwin, to ship to Dayton. The vein is of immense extent and the ore carries a high percentage of metal. On the surface it is rich in copper, but, as in similar formations elsewhere, it is expected to contain lead and silver, with perhaps some gold, at a greater depth. Should the result of the first shipment of ore be satisfactory the proprietors will doubtless work the mine on an extensive scale.

MAXIM MILL.—The Maxim mill was started up last Monday morning. Mr. Nevins, who is in charge, says everything is running along smoothly, and the prospect for a good run is first-rate. The mine is looking well with plenty of ore in sight. It is the intention of the management to put in Frue concentrators at an early day.

SLATE RANGE MINES.—The suits in connection with these mines were called in the Superior Court on Monday, but by agreement of counsel were passed on the calendar for a period of sixty days. It is expected that an agreement will be had satisfactory to all concerned.

Mono.

STRIKE IN THE GREAT SIERRA TUNNEL.—Bodie *Free Press*, July 12: The Great Sierra Con. Silver Company at Bennettville closed down on the 3d instant. It is understood that the formation in the face of the tunnel indicated a close proximity of the ledge, and after the last shot had been fired the foreman looked at the result and immediately closed the tunnel. Priest, the Supt., was telegraphed for and work suspended. The total length of the tunnel is now about 1800 feet. About 15, miner's, inches of water is now flowing. The obnoxious gases and bad air have ceased entirely.

GORILLA.—Homer Mining *Index*, July 12: The outlook for the Gorilla M. and M. Co. was never so flattering as at the present time. Drift B, between the lower and middle tunnel, is carrying three ft of clean ore of good quality; another drift is carrying over two ft, and another has an 8-inch vein of very rich quartz. All the workings are looking well, and there is more ore in sight than the present reduction works can handle in two years. The bullion shipments are now as regular as those of the May Lundy. The new Planet mill has been on trial for several days, and is working admirably. Superintendent Winterhalter has constructed an automatic battery feeder by which he can have a mill feed itself at any rate desired—seven and one half pounds to the minute being the estimated maximum crushing capacity of the battery. So far it has been fed but 4½ pounds per minute, or 3¾ tons per day of 24 hours, and this it reduces to powder with a fraction over 1½ horse power. The discharge is excellent, and the little "Planet" turns in its orbit and crushes and grinds as gracefully as if it were a veteran at the business. There is now little doubt but it will come fully up to the claims of its inventor, A. E. Redstone. Work has been prosecuted in the Clifton mine for some weeks with very flattering results. The tunnel was run in 100 ft along the vein, and several tons of ore taken from this adit and reduced in an arastra last season gave an average return of $42.50 per ton. A winze, started midway of this tunnel, is now down 15 ft or about 60 ft (vertical) from the surface, and at this depth is in a body of fine ore, of which about 25 tons has already been sacked for shipment. In the bottom of the winze the fissure is fully six ft in width from wall to wall, showing a marked increase in width from the tunnel level. Fred Schwartz and John Flavia are making preparations to resume work on their Last Chance claim on the north fork of Rush creek, just south of Mount Lyell glacier, Prescott district. In the Last Chance location the vein has a uniform width of thirty ft of solid quartz, six ft of which is ore running from $100 to $4,200 to the ton. Horace V. Pullen, locator of the Lucky Saturday, a claim adjoining the Mount Lyell glacier, in Prescott district, will not begin work on that claim until about the middle of August, when he intends to take up supplies and prosecute work all next winter. The May Lundy mine is working something over one hundred men, and is yielding the usual quantity and quality of ore, with an abundance in sight in the various workings. The new crosscut into the Lake View, south of the old workings, is showing very rich ore. The bullion shipments are regular and the mill is running steadily and exclusively by water power. One pan is now kept running on tailings, and the new system of blanket sluices, riffles, etc., established by Mr. Brett, the new foreman of the mill, is so admirably arranged that nearly every particle of the gold is saved. The Bryant mine is now one of our regular bullion producers, the Butterfield mill having been thundering away on Bryant ore for a week. The mine is yielding a large quantity of high-grade ore, the largest force ever employed in the mine being now engaged in breaking down ore in the drifts on the 130-foot level. A large train of pack mules is engaged in transporting ore from mine to mill, each mule carrying 500 pounds at a load and making three trips a day, but this has proved inadequate, and more mules are to be put on the coming week.

STRIKE IN GREAT SIERRA—Homer Mining *Index*, July 12: As to the reported strike in the Great Sierra tunnel, Tioga District, it will be well to await reliable information, as outsiders are not yet allowed to know anything about the importance of the strike. That the Sheepherder lode has been cut into is certain; but there is nothing surprising or exciting in that fact, as such a strike was inevitable. As we understand it, but two series of shots were put into the solid quartz after it was reached, and no one but the foreman has been into the tunnel since the last series of blasts were exploded, and we doubt if even he has taken any steps to ascertain the value of the rock. At the tunnel level (which is only 751 feet vertically beneath the surface outcrop) the ore of the Sheepherder lode will probably be found much the same in the general appearance as at the surface immediately above, with a somewhat larger per centage of gold, and hence some appreciation in quality. No very rich silver ore in large quantities need be expected much above the water level proper, which is probably 200 feet or more below the tunnel level. No metalliferous vein has ever been found that carried a uniform quality of ore all along its course, and it would be a "scratch" if the Great Sierra tunnel should strike the Sheepherder in bonanza. On the surface, the ore is far richer about 300 feet south than at the line of the tunnel. The temporary suspension of work in the tuunel has no significance of consequence to the public.

Nevada.

NEW QUARTZ MILL.—Grass Valley *Union*, July 10: Henry B. Johnston and Wm. C. D. Body have entered into a co-partnership to build a custom quartz mill, which will be erected on the west side of Wolf creek, a little north of the old Gold Hill mill. It will be a ten-stamp mill, and run by water power. The mill will be commenced in a few weeks. Since the destruction of the McAuley mill and the tearing down of the old Gold Hill mill there has been no custom mill within the limits of the town, although there are four in the vicinity. The new mill is needed, and the location will prove a great convenience to prospecting companies.

A GOOD MINE.—Nevada *Herald*, July 12: The Ophir mine, at Grass Valley, so we learn, is at present paying its owners very handsomely. The Ophir is one of the old stand-bys of that place, and is regarded as a very valuable piece of property. We wish Grass Valley had a dozen of the same sort.

RIVER MINING.—Nevada *Herald*, July 14: The company of Chinese miners who have leased from the Manzanita Co. the bed of Deer Creek, from the suspension bridge to the Main street bridge, are still working away, and persons who have watched their clean-ups say they are doing very well. The water is turned by dams so that one-half of the creek can be worked out as deep as they intend, when the water course will be changed and the other half of the creek sluiced off. At present the Chinamen are working between the Broad and Main street bridges, at which point the tailings are from 10 to 20 feet deep. Besides the gold that is caught in their boxes, the heathens have found several watch chains and other articles of jewelry of greater or less value that have at different times been lost in the creek. Charles Adolph and partner are sluicing off the tailings above Main street bridge, near the Ice House. They struck one piece of ground that paid them from $20 to $30 a day. The tailings now being washed off pay them about $6 a day to the man, which is certainly very flattering, but as they have only a limited amount of ground to sluice, their good luck will soon be at an end.

Plumas.

BONANZA.—Greenville *Bulletin*, July 12: From Mr. Hall, we learn the following: "The tunnel has reached the ledge, and has been driven eight feet in the solid, and several ft in the soft formation. Mr. Dragovich has examined it and says the rock in the tunnel looks better than that on the surface, but as the ledge pitches into the mountain, and as the tunnel is hardly under the perpendicular of the ledge on the surface, he thinks there is not a doubt that a large body of ore will be on the other side of the soft formation. At present it is not known how large the vein is, but it is the opinion of Mr. Dragovich that it is a very large and permanent vein. In the Ophir Consolidated, tunnel, No. 3, which has been driven along the hangiug wall of the ledge 60 or 70 feet, is all in a decomposed quartz which carries considerable fine gold, the ledge itself showing some very good ore. Mr. Hall is well pleased with the prospect, and will drive the tunnels ahead in both of the claims.

ELIZABETHTOWN—*National*, July 12: Loring & Leavitt struck it rich in their east drift, one day this week, getting coarse gold and dirt that yielded about five dollars to the pan. One chispa weighed $22.50, and the most of the gold is coarse. This strike is a very important one, as it insures them at least seven or eight hundred feet of rich ground, and also proves that the Riverdale ground has the same channel. They are nicely fitted up, and will soon be making money rapidly.

Siskiyou.

PICK AND PAN.—The Russian claim on the North Fork of Salmon, 5 miles below Sawyer's Bar, is prospecting well. It is the intention of the owners to put up a saw mill in a few months for the purpose of obtaining lumber to build a new flume which will be three miles in length. Several men are employed in the mine at present. Mr. Olsen, of the above company, has just made a rich strike a half mile below the Russian claim, and will at once make preparations for working the new find. Mohr, Kline and Curran, on the North Fork of Salmon, are pegging away in their rich claim stripping surface dirt. They have water the year around and annually extract big pay. Gieschen and Kellner, below Sawyer's Bar, are building a new flume ½ mile long on Buckhorn Bar. Their ground was worked many years ago, but it gives up good wages notwithstanding. Biglen and Kline are opening up a river claim below the Gus Mohr mine, on the North Fork of Salmon, with excellent prospects ahead. It is considered the most favorable place on the river—the high banks on either side being formed of sloping bed rock, well calculated to concentrate the gold in the river below. Thos. Hickey and Sons, near Sawyer's Bar, have a good paying property, and they are working it in an energetic manner. They have one giant and moderately fair water privileges. They are engaged in cleaning up this week. Barry, James and Rundle, of Sawyer's Bar, have been ground sluicing for the past two months, and have realized from $7 to $8 a day to the hand. Myers and Kuchenbuch have 20 acres in course of patent on Paradise flat. Their profits have been very large for the past two years, and they base great expectations on this particular season. They have an inexhaustible supply of water and all the necessary paraphernalia for extensive operations. Monahan and Hutchinson, on the west end of Gold Hill, are drifting, making good wages, and hoping for better in the future. The water was exhausted before the Gold Hill Company succeeded in finishing the clean up, and it is hard to determine how the season paid. Fisher and Frank, in Eddy's gulch, are being favored with rich returns from their labors. Their claim has been in operation for the past ten or twelve years, and they have a sufficiency of ground lor a long time to come. Bill Burns, in the same locality, has a claim consisting of 13 acres of patented land, which never fails to liberally reward Mr. Burns for his untiring efforts. He is now engaged in cleaning up, and the results, so far, have been entirely satisfactory, although the season's water fell short. David Casey, of Eddy's gulch, ground sluiced all last winter, and is now working the bed rock with great success. Joe Frazer and company are cleaning up, and the prospect of a large yield is exceedingly flattering. Samuel Finley, at Sawyer's Bar, has sufficient surface stripped to furnish during the summer on pay dirt. He has completed a new flume. Charles Nickelt, in the old Doty drifting claim on Salmon is doing well. The claim pays about $34 per week to the hand. The country, ten or twelve miles up the North Fork of Salmon, promises to be a rich field for future mining operations. Gold in small quantities can be found most anywhere in that section, and a little prospecting will eventually uncover or lead to the discovery of some very rich deposits. Girrard and Burns are constructing a large ditch from Jackass gulch to the high benches back of the old Bastile mine. They have been engaged upon the work about a year, and it will take all of six months yet to complete the undertaking. Success is deservedly theirs. The Klamath quartz mine is running steadily on very fair rock, and the shareholders continue to receive a monthly dividend. Thirty-five men are employed, under the superintendency of James B. Tonkin. The Uncle Sam has probably suspended milling by this time on account of an insufficiency of water. The failure of water leaves the company with a large quantity of rock in the dump, which will be crushed this fall. The Uncle Sam has proven a perfect bonanza to Sheffield and Son. The Evening Star is being worked upon a small scale, the shareholders being desirous of testing the permanency and paying qualities of the lode before investing further capital. Mr. Robert Small, who was interested with Heartstrand and Bemmis in a quartz mine on French creek, sold his interest last week to Mr. Rosstetter. Four tons of rock crushed there a short time ago yielded six and a half ounces. The Montezuma, at Callahan, is cleaning up and will take out big money. The "Fortune" at Callahan has been in a hole all season; just getting out, and prospects are getting good. Mr. Crawford, on Kangaroo, is cleaning up, and the indications are that he will have a profitable yield. Mr. James Gould, an expert miner from Calico District, formerly of Salmon, is prospecting the quartz mines in the vicinity of Oro Fino. It is currently reported that he will run the A. M. Johnson quartz mill this season. The water is failing in Oro Fino district, and the miners are winding up for the season, with rather a short run. The Eastlick brothers have decided not to clean any bedrock this season, and will only clean up their flume. Wright & Fletcher are about through cleaning up. Campbell & Co. are still running with a good head of water, and will probably run from two to four weeks yet. They will no doubt make the largest clean up ever made in that vicinity, as the amount of ground worked this season is immense, and the prospects are remarkably good.

Shasta.

IGO ITEMS.—Cor. Shasta *Courier*, July 12: The Chicago mill is now running on sulphuret ore from the Central mine, the Hendy concentrator working quite satisfactorily. The free gold ore from the surface of the Chicago did not yield as well as expected. Some "chloride" ore is being taken out at another place that will probably give better results, the intention being to save the silver also. Ten tons from the Centennial mine will be tried for the silver contents by "free milling" process, and if successful, more ore will be taken out. Five tons of Kanaka ore is soon to be packed over and washed. The Crystal shaft is being cleaned out and retimbered to permit of examination by Red Bluff parties. If a satisfactory showing is made, the mine will be taken and worked in the good shape this excellent property merits. E. S. Ballou's arastra is running on Manzanita ore. The ground is too wet to do much but surface work at present. Water for power promises to be ahundant all summer. Smith has sold his interest to Robinson & Co., who have two men at work taking out ore. They also have men at work on the Central, taking out ore. The two mines keep their Cannon Ball mill running most of the time. J. B. Strong is taking out ore from the Atlantic, and working it at the Crum arastra.

San Bernardino.

CALICO DISTRICT.—Calico *Print*: A. G. Rhodes has just completed a contract on the New York mine, located in West Calico. The ledge of the mine runs parallel with that of the King, but is wholly independent thereof as will be seen by the assays given below. The mine was located by Mike Toohey and sold by him to Messrs. Hudson & Rose, of Los Angeles. Toohey received a contract from these parties and sunk a shaft on the mine of 102 ft, since which time the mine has been idle until this contract was given Mr. Rhodes. A drift was made from the bottom of the shaft 30 ft east and 12 ft west without getting through the ledge. The ore is spar and quartz, and two assays had are as follows: First, $211 gold, $3 silver; second, $65 gold, $2.25 silver. The ore, independent of the ledge on the surface, assays all the way from 120 to 480 ounces in silver. The porpbyry carries silver and the ledge gold. This no doubt is a valuable property and will probably set a great many of our prospectors searching for gold. The Lone Star mine, adjoining the New York, promises to excel the latter, judging from indications and assays already obtained. R. B. Johnson, lessee of the Sam Houston No. 3 and Blackfoot mines, has gone to Los Angeles and will return in a few days and put on a force of twelve or fifteen men to work these mines. In the first-mentioned mine a four-foot ledge has been uncovered and large quantities of $100 ore are seen on every hand in the various openings, and the results of recent developments have been so encouraging that Mr. Johnson can with considerable assurance promise to make returns in bullion that will attract no small degree of attention in our mining circles. Last week five tons of average ore sampled $113 to the ton at the Daggett Sampling Works, and a considerable quantity of this character of ore is on the dump. The Garfield mine started up again on Monday with its usual force of men, running out their usual amount of ore.

NEVADA.

Washoe District.

HALE AND NORCROSS.—Virginia *Enterprise*, July 12: The usual shipments are being made from the ore deposit on the 200 level. The Chollar bulkhead on the 2600 level was completed yesterday. When work will be resumed on the 2800 level cannot now be stated. It appears to depend wholly on orders below. The work done on that level, on the 4th, 5th and 6th of July, showed up well.

ALTA.—No work has been done in the east drift on the 2150 level since July 3d, on account of the appearance of water in the face. The diamond drill has been run in from the face of the west drift on this level a distance of about 300 feet. No water has

been tapped to the westward, and the ground appears to be of a favorable character.

MEXICAN.—The rock in the bottom of the winze below the 3200 level still blasts badly. But about seven or eight feet will be made this week. The rock is a sort of black bastard quartz, which is hard to drill, and in blasting blows out in pot holes. This winze is being sunk jointly by the Ophir, Mexican, Sierra Nevada and Union Consolidated companies.

BEST AND BELCHER.—The joint Gould and Curry southwest drift on the 2500 level is passing through a favorable formation of soft porphyry and clay, with some promising streaks of quartz. The joint Consolidated Virginia west drift, on the 1200 level, is being advanced at the rate of 26 feet per week, in a favorable formation of vein porphyry, clay and quartz.

CHOLLAR.—The bulkhead on the 2600 level was completed yesterday. Drifting on the main adit south is progressing well. It is expected to have the drift completed to a point 400 feet south of the north line on or about the 28th, after which a crosscut at right angles with the main adit, will be driven west to intersect the vein.

OPHIR.—Besides the work being done in the deep winze jointly with the other north end companies, the Ophir folks have started a drift on their 500 level from the main shaft, which will be run west to tap and train the old upper workings, in which water now stands to the hight of the 250 level.

SIERRA NEVADA.—No work is being done in the Sierra Nevada ground proper. Jointly with the Ophir, Union Consolidated and Mexican companies a winze is being sunk below the 3200 level in the ground of the latter company.

GOULD AND CURRY.—The joint Best and Belcher drift southwest on the 2500 level, is making good progress in a mixture of soft porphyry and clay, with streaks of quartz of a favorable appearance.

UTAH.—The south drift on the 1950 level is still passing through a favorable vein formation of quartz, clay and porphyry. There is no trouble with water and the rock works well.

ANDES.—The bottom of the winze shows but little change. The east drift is still in quartz of a favorable character. Some ore is being found that will pay for extraction.

POTOSI.—The work in this mine depends very much on that in the Choller, the two mines being very intimately connected as regards developments on their lower levels.

CONSOLIDATED VIRGINIA.—Some water beginning to show in the face of the south drift on the 2400 level. Work has been suspended at that point and the diamond drill put in.

UNION CONSOLIDATED.—The only work being done is that which is progressing jointly with other north end companies in sinking the deep winze in the Mexican ground.

CALIFORNIA. Owing to the appearance of water in its face, work in the south drift on the 2900 level has been suspended and the diamond drill put in.

YELLOW JACKET.—The usual amount of ore is being extracted and sent to the mills. The exploring drifts are showing very well.

CROWN POINT.—Sufficient ore is being extracted to keep the mills on the river running to their full capacity.

Arabia District.

ORE SHIPMENTS.—*Cor. Silver State*, July 8: The mining industry is looming into prominence in this vicinity. Last week George Lovelock shipped five carloads of ore from Arabia District to the Palisade reduction works; also one carload of nickel and cobalt salt to San Francisco from the Cottonwood mines. Mr. Lovelock received an advance of $1,000 on the nickel ore, which is to be shipped to Swansea, England. J. W. Mills is shipping ore from the Humboldt Queen mine to the Mill City reduction works, and he has contracted with N. P. Davis to haul 500 tons of ore from the mine to the railroad. Four carloads have already been shipped from the mine to Mill City. Messrs. Tangerman & Ried are repairing the gold mill in Limerick Canyon, and as soon as they get it in running order it will start upon ore from the Hope & Bennett mine.

Central District.

OPENING MINES—*Silver State*, July 8: Ex-Senator M. S. Thompson says Central District, west of Mill City, is coming to the front as a mining camp. Several men are engaged in opening mines there and the prospects are good for a lively camp. Frank Clark sent two tons of ore to San Francisco from the railroad mine, to test the quality of the ore, and it netted him $260 per ton. The ore, besides silver, contains 22 per cent. galena, and there is plenty of it. The Marietta mine, owned by Mr. Thompson is prospected to a depth of 320 feet, and looks well in the lower works. The owner intends to have a lot of ore worked at Mill City, when the new reduction works at that place start up. The heavy discount on silver is rather discouraging to miners, who complain that while the Government is deriving millions of dollars profit from the proceeds of the miners' labor, they have to lose from ten to fourteen per cent on every bar of bullion they produce.

Esmeralda District

AURORA REVIVING—*Walker Lake Bulletin*, July 8: Aurora is a camp that will not stay in the dumps. Nothing about that town remains in the dumps except the waste rock and an occasional piece of rich ore which has been overlooked. Several of the mines are now doing well and the citizens are jubilant over the prospect of the resumption of old time activity. Judge Seawell and John Neidy are working the New Esmeralda to advantage. A short time since a working sample of their ore was milled and the result assures a profitable result to their enterprise. The Silver Lining, the Poor mine and others are also doing well, and, while not making much noise, Aurora is getting ready to stand near the head of the list of the bullion producers. McKinlay, of Aurora, appreciates the advantage of paying good miners good wages. He has been, for some time, working a mine in that camp and is paying $4.25 per day to his men. The result is that he gets the best men in the country and each of them takes as much interest as though he was an owner.

Ophir Canyon District.

GOOD NEWS.—Eureka *Sentinel*, July 12: It will be gratifying to many old-time miners of Eastern Nevada to hear good news from Ophir Canyon, a district in which much confidence has always been felt, though in the earlier and high-pressure days, its mines were not made to pay. M. J. Curley and the Schmidtlein brothers are taking out some very rich ore in the Rising Sun mine. The Grizzly and Cameron Mining Companies also have rich mines of gold bearing quartz. The owners of the mines are James Crookshanks, John Foster, Henry Warne and Patrick Lenard. The Gold Point, another flattering prospect, is situated about a quarter of a mile from the Twin River Mining Company's mill. It is owned by M. J. Curley, Jr., and Mrs. Annie Ripley. They have several tons of first-class ore on the dump, and enough more in sight to keep them busy a year. The Morning Star has a four-foot ledge, which will run from $100 to $200 a ton. M. J. Curley is the fortunate owner of this mine. There is another mine at the Summit of Ophir Canyon, the ore of which will go from $400 to $1,000. This belongs to Michael Timlin, of Austin, and Mr. Rogers, of Smoky Valley. They will set men to work shortly opening up their property.

ORE SHIPPED.—Battle Mountain *Messenger*, July 12: Patrick Lenard, who left here about a week ago with a carload of ore from Ophir Canyon for Salt Lake, returned yesterday. His assays show an average of $160 per ton in gold. Mr. Lenard is highly pleased with the returns, and says he has a fortune in his mine at Ophir.

Tuecarora District.

ARGENTA.—*Times-Review*, July 10: South crosscut on the 400 level is in 168 feet.

CENTRAL CON.—South crosscut extended 20 feet. No change in formation. Water stronger.

NORTH BELLE ISLE.—North drift, 70 level, advanced 8 feet. There is some improvements in the width and grade of the ore in the past week.

BELLE ISLE.—Work has been connected on the line crosscut to the East vein, 150-foot level.

GRAND PRIZE.—South drift on the 200 level has been advanced 11 feet during the week, and work for the present stopped there. South drift on the 300 has been advanced 27 feet, and work resumed in face of South drift on 400. The stopes above the 400 are producing some good ore, and above the 300 the ore is rich.

NAVAJO.—On the 250 level, the south drift on the "east" vein, has been extended 6 feet. Work has been commenced on winze, at the end of North drift from No. 2 crosscut, "east" vein, 150 level. No. 2 crosscut, is 240 feet south of No. 1 cross-cut, same level, or 345 feet south of the Belle Isle line. The vein at all points is in high grade ore. There is nothing material to note in workings at other points. The usual work has been forwarded at the mine and mill.

White Pine District.

EBERHARDT.—*White Pine News*, July 5: Reports reach us from Hamilton that the Eberhardt Company are meeting with very encouraging prospects in Treasure Hill. The burleighs have again been set to work. The formation in the Jennie A, at White Pine Mountain, is also said to have undergone a change for the better. Lively quartz, carrying silver, has been struck in the lower workings of that mine.

ARIZONA.

COPPEROSITY MINES—*Cor. Onijoloa Prospector* July 8: The Casa Grande Copper Company received two copper smelters last week which they are forwarding to the Copperosity as fast as possible. They are the famous water-jacket smelters made by Rankin, Brayton & Co., of San Francisco, and are perfect in every particular. It will be but a very short time before these smelters will be producing bullion, for Supt. Hillings is pushing operations with all possible speed. He has about completed a pipe line from the Copperosity to the Vekol basin, where Messrs. Summers & McGonigle have recently bored a well which it is estimated will furnish all the water necessary, as the supply appears to be well-nigh inexhaustible. The Copperosity is developing into a fine property—large bodies of high-grade ore having been found recently in the lower workings. Considerable work is being done in different parts of Casa Grande district, and the prospect of lively times this fall is very flattering. The following is a report of development work on the Ben Nevis mines for the past week: Tunnel No. 1 is in 217 feet in a better working formation than formerly. Crocker tunnel No. 5 has been advanced to 61 feet. Stringers of ore have been cut which give excellent assays. The winze has reached a depth of 121 feet. The bottom of the shaft is in a fine porphyry. South drift from tunnel No. 2 is in 110 feet, with no material change in the formation from last report. Peer tunnel has been progressed to 239 feet.

COLORADO.

LAWSON MINES.—Colorado Mining *Gazette*, July 5: Red Elephant mines are doing well. Kennick & Irvin's ore mill-runs, first-class, $240; second-class, $120. There are from eight to twelve inches. It is on the White lode. Putt & Co., on the White, have a 10-inch streak of ore. It is on the Soyster streak and runs $113, one class. Longrace & Gates, west of Putt & Co., are raising and have from two to six inches of ore, which mills, first-class, $165; second-class, $85. Potter Brothers are working under Putt & Co., and Longrace & Co., in the Schwartz shaft. Their streak averages from six inches to one foot, which runs, first-class, over 200 ounces silver per ton; second-class, over 90 ounces per ton. Pat. Holland, working on the Free America Extension, first level, has a fine streak. Gates & Co. are drifting on the third level of the extension, and have a wide paystreak. Hugh Rehan, on No. 3, of the Joe Reynolds, has a fine streak of high-grade ore. O'Connell & Co. are doing well, as are Lewis & Co., on the Murray mine. On the Joe Reynolds, No. 3 Chopin, Holley & Co. have a good streak in the slope. They have two feet of solid ore. Hanning & Harris have leased the Free America Extension lode, and have twenty-six men at work now under lease. Wit Mulchan & Co. are running a crosscut, down the hill from No. 2 level of the Extension, to cut a lode forty-five feet south of the Extension, and when cut they expect a bonanza. Everything is looking as if the hill will boom as in 1878-9. Coontz, the owner of the Little Giant, has the finest streak on the hill. Ore runs, first-class, $532, and a very good size, which makes him sanguine. Three carloads of ore shipped by Moore & Co., from the Joe Reynold's mine, netted $8,000.

BIG STRIKE ON FREE GOLD HILL.—Chaffee *Times*, July 8: Just sixty ft west of the west line of the Free Gold mine, which is the oldest worked claim on that hill, and out of which nearly $10,000 in gold was taken in 1878 and '79, is an astonishing bonanza. Charles Simpson, A. D. Terry and their partner, whose name we cannot now learn, staked, about sixty days ago, the "Etty," but encountered nothing encouraging until about 15 ft deep, when they found the ore so liberally sprinkled with free gold that it was visible on every piece taken out. A handkerchief full of the ore panned 50 cents in gold, and that by a very imperfect, crude process. The shaft is even now only 20 ft deep, but the vein is fully 4 ft and shows a vast body of ore. On Monday morning the boys were offered $1,000, but declined. Visitors have been plentiful on the ground and quite a little stir was occasioned. The claim is evidently on the same vein with the "Worthy Chief Templar," which shows so many pieces of ore, besprinkled all over and all through with gold. The Colorado Mining and Land Exchange is now negotiating to get machinery to work the ore of both claims.

LEADVILLE.—*Herald*, July 8: The Logan and Derry mine is being worked by a number of leasers. Grading for a new mining plant on the Minnie mine has been commenced. The Oro and Antioch quartz mills are both running—the former on Nellie S. and the latter on Florence mine gold ore. The owners of the El Capitan have contracted with the McClelland mill, for the treatment of 200 tons of ore from their mine. Mr. Robert O'Neil made a trip on Musquito range the other day, and reports lots of snow still covering large sections of that range. Mr. Gilbert, of the Iron Hill Consolidated, at Red Cliff, shipped a carload of ore the forepart of this week, which netted him $2,270. The mineral was extracted from the quartzite. The new Cash Creek working flume, 36 inches wide and 8,200 ft long, of the Twin Lakes hydraulic syndicate, is almost completed, and will be in working operation by the first of the week. Mr. J. A. Walsh showed the reporter a settlement with the smelter for thirty-five tons of ore, recently shipped from the Consolidated Virginia mine on Sugar Loaf mountain, six miles west of Leadville. The lot brought $3,594 after deducting smelting charges, or $71.30 per ton.

IDAHO.

ANOTHER ORE PRODUCER.—Wood River *Times*, July 8: Ore has commenced coming from the Mountain View mine, near Bullion, and the fourth carload left Hailey yesterday. It sold on a basis of 234 ounces silver per ton, and 56 per cent lead. Now that the stream of ore has commenced running from this mine, it will doubtless not run dry for years. Mose Hirschman, Barney Quigg and Judge McBride are the owners of the Mountain View.

OVER $200,000 IN SIGHT.—William Boyd, one of the owners of the Bates & Boyd group of mines, near Bullion, was in town yesterday, and informed Jos. Wurtzburger that he had between 15 and 20 men at work on ore that averages over 200 ounces to the ton. Careful computation shows over $200,000 worth of ore in sight in the Bates & Boyd. Mr. Boyd was formerly engineer at the Flagstaff mine, in Utah, and his old friends will be glad to hear of his good luck.

ELKHORN ORE.—During the past few days the leasers of Elkhorn ground have been having their ore hauled to Hailey, whence it is shipped to the smelters. They will continue to ship between 20 and 30 tons per day until they have brought all their ore down. They have between 230 and 250 tons which, they think, will average them $90 net per ton. This comes from ground of which they had undisputed possession. Out of some disputed ground a large quantity of ore has been extracted which the leasers claim to have discovered and owned, but the ownership is the subject of a lawsuit in the District Court.

THE CONCENTRATING WORKS.—The new concentrating works just erected by Jabez Chase & Co. at the smelter site at the mouth of Indian creek, has finally been got in first-class working order, and started in to do regular work. It is, therefore, one of the industries of Hailey. The owners are experienced mining and mill men, who will treat all who intrust their ores to them fairly, and they will do good work at fair rates. Mr. Chase will leave in about a week to erect the concentrating mill of the Silver King mine, and remain at Sawtooth for the balance of the summer. When he goes Milton E. Pinney will assume charge as Superintendent of the Hailey Concentrating Works.

MONTANA.

BUTTE BONANZAS.—*Inter-Mountain*, July 8: The Lexington company employs 300 men, and reduces monthly about 1,500 tons of ore, which pulps in the mill between $55 and $60 per ton. The Mountain View is now making regular shipments of copper ore to Baltimore, and promises soon to be second only to the Anaconda and St. Lawrence in the amount of its crude exports. Patents have been granted for 1,392 mineral claims in the Butte district. This fact speaks eloquently for the mineral wealth by which the Queen City of the Rockies is surrounded. Sinking is actively progressing on the Montana company's Parrot claim. No time will be lost in reaching the 300 foot station. The Lexington vein has not yet been cut by the 650 foot south cross-cut. The Harris tunnel now has a total length of about 1,150 feet. A winze, 800 feet from its mouth, is down 100 feet on a vein of good looking silver ore. Another winze is being sunk near the face, which also shows an excellent quality of ore in the bottom. The Dexter mill, working on ore from the Orphan Girl, is producing more bullion, in proportion to the number of stamps, than any other mill in the district. The south vein of the Alice continues to produce an abundance of fair grade rock, but the supply from the main workings is limited. The Magna Charta keeps up its record, but the expenses of its operation are high on account of the separation of the ore bodies. If the 1st, 2d and 3d south veins should unite at a greater depth, but little comparative expense would attend the extraction of ore, and the output and profits would be proportionately increased. Mr. Julian Smith has charge of the improvements now being made at the Colorado smelter, where a very commodious building is being erected for the new rock breakers, Cornish rollers, etc. A Denver man, representing Mathews & Webb, ore brokers, has been making investigations for the past ten days concerning the feasibility of ore sampling works. Owing to the present situation of affairs and the probable opposition of the smelting companies, the outlook is not considered encouraging for the project. The Moulton mill is working some custom ore from the Poser, which, on the 150-foot level, is looking well in both the east and west drifts, and producing a good deal of ore from the stopes. The Original is not now in very active operation, but some new ground is being explored. The ledge is somewhat broken up on the 400-foot level. Sinking is vigorously progressing from the 100-foot station of the Orphan Girl. A force of seven men is employed on A. W. Barnard's placer claim, and the clean up this year promises to be larger than at the close of any previous season during the past five years. The Clear Grit shaft is down 275 feet. It is predicted that the cross-cut from the 320-foot station will expose one of the strongest and most extensive silver-copper ore bodies in the district.

SILVER.—Butte *Miner*, July 9: A pleasant sight to behold, and one profitable to the stockholders, was to be seen in the Alice office yesterday. Twenty-seven silver bricks, averaging 95 pounds avoirdupois, were displayed upon the shelves of the large safe in the company's office. These were the product of a nine day's run. Take courage all ye Alice stockholders. At that rate you will soon be rich. Superintendent Hall says the mines belonging to this company are looking better now than they have ever done. We learn from authority, though names are withheld, that negotiations are in progress for the sale of a mine near Butte, that has up to this time not been considered first-class, and is not well known, at the price of $350,000. The same authority states that the owner would not now sell if he were not in debt. An expert says that there is now at least half a million in sight in the mine. The owner is to be congratulated. This sudden step from poverty to a condition in which one can know where the cash is to pay for his breakfast is too utterly too too to contemplate. We understand from Mr. Louis Demer that the more work is done on the Granite Mountain of Philipsburg, the better it shows. It is worked, not by a shaft, but by tunnels run into the mountain. There are now three of these tunnels in operation. The lowest of these taps the lead at the depth of about 500 feet. The ore is very rich. This is the mine that yielded $265,000 from 1,500 tons of ore.

ONE THOUSAND OUNCES IN GOLD.—*Herald*, July 8: Yesterday the Merchants' National bank received one thousand ounces of gold retort from the Homestake mine, on Virginia creek, which can be seen to-day in the window of the Merchants' bank, a tempting batch of golden fruit labeled "Montana turnips," four in number. The Homestake gold mine, some twenty miles from Helena, is the property of Wm. Negus and Henry Jacobs, which they profitably work with a five-stamp mill. The thousand ounces gold retort is the product from one hundred and fifty tons of quartz and are worth $14,000.

NEW MEXICO

GOLD BRICK.—Silver City *Enterprise*, July 4: The Carlisle mining company shipped a gold brick valued at $14,000. It was the result of a fourteen day's run. On the 30th ult. the magnificent new reduction plant of the Arizona Company, at Clifton, was completed. The water was turned into the turbine wheel from the flume, full force, and the entire machinery in the plant set in motion. The machinery was also run by steam power and everything works to a charm. Two sixty-ton smelters will be blown in on Monday and three more during the week. There is a much better feeling here than has been in a year, and everyone is confident that the company will make a success and realize handsomely on their big investment. The Pinos Altos Gold and Silver Mining company's mill at Pinos Altos started up on Sunday last, and has been running on regular time ever since. It is one of the most complete and best arranged 10 stamp mills in the country. The company have enough ore on the dump and in sight in their mines to keep the mill pounding away for two years. The ore averages $17 per ton. The company also have from 4,000 to 6,000 tons of mill "tails" on hand, which are estimated to contain $80,000. They are being run through the stamps and over the vanners at the ratio of about five tons of "tails" to ten tons of ore. From this time on the Pinos Altos Gold and Silver Mining company will be a regular producer.

UTAH.

REVIEW.—Salt Lake *Tribune*, July 11: The week has been a fair one in the movement of the metals. The roads in the canyons and hills are getting once more in passable condition. The receipt of bullion and ore in the city for the week ending July 9th, inclusive, were as follows: Bullion, $131,885.53; ore, $3,800; total, $135,685.53. The shipments of the Horn Silver Company for the week aggregated twenty-three cars of bullion, $69,000; making the year to date, $1,220,000. Sales of Horn Silverstock in New York, 2,408 shares for the week ending July 3rd, at the following prices: June 28th, $5.25; June 30th, $5.13; July 1st, $5 38; July 2nd, 5.25; July 3rd, $5.25. The shipments of the Ontario for the week were forty-two bars, $29,817.17; total for 1884, to date, $827,449.46. No sales of stock reported from New York. The output of the Hanauer smelter for the week was nine cars of bullion, $19,600. The Stormont sent up two bars of silver, $3,985. Two cars of Day bullion were received, $9,483.36. One lot Nevada ore came in, valued at $750. Our advices from all the mining centers are to the effect that great activity prevails everywhere, with unusually good prospects for a prosperous season.

F. A. HUNTINGTON,
SAW, SHINGLE, AND QUARTZ MILL MACHINERY.

We Call Attention to the Following Testimonials as to the Capacity and Durability of the Centrifugal Roller Quartz Mill:

SAN FRANCISCO, Dec. 27, 1883.

Mr. F. A. Huntington, San Francisco, Cal.

DEAR SIR:—The four-foot Centrifugal Roller Mill, bought of you in August, 1882, for the Whidden Gold Mining Company, of Shingle Springs, has given entire satisfaction, both on our own and on custom work, saving from 85 to 90 per cent of the gold in the mill. In conclusion I will say that we are so well pleased with it that Mr. Whidden and myself are putting one of the same size on the Tohongo gold mine, near Ravenna, in Los Angeles county.

Yours truly, P. VEASEY,
34 California St., S. F.

FINE GOLD GULCH, Nov. 10, 1883.

Mr. F. A. Huntington, San Francisco, Cal.—DEAR SIR:—In reply to your inquiry concerning the working of your Centrifugal Roller Quartz Mill, I am pleased to say that I run one of them for seven months, doing custom work on different varieties of rock, and that the mill gave satisfaction in every respect, and did all that you claim for it.

Yours truly, BYRON JENNINGS.

CARIBALDI MINE, Dec. 17, 1883.

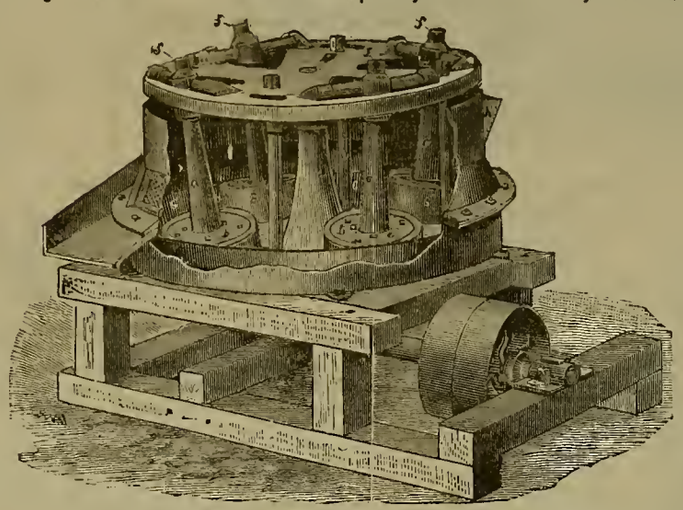
F. A. Huntington, Esq., San Francisco, Cal.—DEAR SIR:—In reply to yours of the 10th inst., I take pleasure in assuring you that your Centrifugal Roller Quartz Mill gives entire satisfaction, and I can heartily recommend it to mining men who want a cheap and efficient crusher.

Yours truly, E. I. PARSONS, Supt.

32 WASHINGTON AVENUE,
SAN FRANCISCO, Dec. 29, 1883.

F. A. Huntington, Esq., San Francisco, Cal.—DEAR SIR: Having run one of your Centrifugal Roller Quartz Mills on sample lots of rock from more than twenty different mines, I must say that in every instance it has given the best of satisfaction in every particular; and I recognize its superiority over any other mill manufactured.

Very truly yours, D. O. MOWRY.



CENTRIFUGAL ROLLER QUARTZ MILL.

The work done by the Centrifugal Roller Quartz Mill, during the past two years, on various mines and different kinds of rock, PROVES ALL THAT IS CLAIMED FOR IT, viz.:

1. The cost of same capacity is not more than one-half that of stamps.
2. Freight to mine one-fourth that of stamps.
3. Cost of erection at mine one-tenth that of stamps.
4. It runs with one-third the power per ton of ore crushed.
5. The wear is less than that of stamps.
6. The wearing parts are easily duplicated.
7. It has a much better discharge, and leaves the pulp in better condition for concentrating.
8. It is a better Amalgamator, saving fully nine-tenths of the gold in the mill; the balance can be saved on plates in the usual manner.
9. It is continually crushing; not like the stamp, using power to suspend it in air ninety-nine one-hundredths of the time and the balance making a thundering noise, and accomplishing *comparatively* small results. It is as far in advance of the stamp mill as the present method of making flour with improved rolls is over the Indian's mode of crushing corn in a stone mortar.

PATTEN'S CONCENTRATOR.

This machine requires less power, less care or attention, and is less liable to get out of repair than any concentrator now in use; all of which any practical miner will comprehend when seeing it in operation.

SONORA, CAL., Dec. 1, 1883.

F. A. Huntington, Esq., San Francisco, Cal.

DEAR SIR: In reply to yours of recent date, inquiring about the Centrifugal Mill which I bought of you, I will say that I have run the mill four months on hard rock; and I take pleasure in adding that the mill has in every way given the best of satisfaction.

Yours truly, J. H. NEALE.

CARIBALDI MINE,
Calaveras Co., Cal., Dec. 17, 1883.

F. A. Huntington, Esq., San Francisco, Cal.—DEAR SIR:—In answer to your inquiry concerning the working of the five feet Centrifugal Mill, bought of you for the Caribaldi mine in Calaveras county, I take pleasure in saying it gives entire satisfaction in every respect, and I only regret that the mine does not warrant the purchase of more of them and the continued use of the one now in operation.

Very truly yours, D. B. SMITH.

F. A. Huntington Esq., San Francisco, Cal.—DEAR SIR—Your Centrifugal Roller Quartz Mill has run on the Whidden Gold Mining Co. property at Shingle Springs, El Dorado Co., Cal., about four months, and it has done good and satisfactory work, a greater proportion of gold remaining in the mill than in the stamp battery. FRED JONES, Supt.

HILDRETH RANCH, Fresno Co., Cal.,
January 11, 1884.

F. A. Huntington, Esq., San Francisco, Cal.—DEAR SIR—In regard to your mill (Centrifugal Roller), I have crushed about 500 tons of rock in the mill, and am glad to say that it has given entire satisfaction, and can recommend it to the public as the most expeditious and least expensive method for crushing and milling ore that I have ever seen. Truly yours,

THOS. HILDRETH.

Sedim n' B ring Streams in Europe.

At the last meeting of the Technical Society of the Pacific Coast, Mr. Geo. J. Specbt, read a paper "On the Treatment of Torrential Sediment-Bearing Streams in Europe, and its application to California." The paper was very fully illustrated with diagrams and large photographs of the improvement works on the rivers in France. In Southern Europe, where the devastation of the valleys by mountain streams, in consequence of deposits of detritus, has been immense; the evil has been remedied successfully by simple and comparatively cheap means These cousist mainly of so-called "thalsperren" (retaining and consolidating dams), either of masonry or of hurdles and fascines, by the replanting of forests and by seeuring the slopes by ereating vegetation upon them. The work is done by the Government, or by private individuals or associations, with subsidies from the Government. Mr. Specht described with some detail the system earried out by the French Government to retain the debris. They build small brush dams all along the the streams at such places where sediment occurs. They adopt the system of holding back the sediment in small quantities, not letting large accumulations occur. The photographs showed how their works were constructed. From year to year they raise the bed, but confine the debris in the stream. Large tracts of land are reclaimed and villages prevented from destruction by debris. It may he stated that the debris occurs not from mining, but because the land has been denuded of plant-life by sheep and goat pasturing, so that heavy rainfalls result in vast quantities of debris passing down the stream.

When the dams are completed trees are planted on the hillsides. The forests newly planted are exempted from taxation for thirty years, and no trees arc allowed to be cut for a period of twenty years after the commencement of the improvement works. The use of the field for pasture is subjcct to regulation made from year to year in order to prevent inconsiderate destructiou of vegetation. Instances were cited where a small outlay had secured large profits. The government had spent large sums, but found the returns greater than the expense in putting land in condition for agriculture where formerly the dcbris laid waste large tracts.

Mr. Specht drew some conclusions iu reference to the solution of the debris question in California, by about the same means, changed and altered according to local circumstances. He empbasizes the principle that the evil should be attacked at its very sources, and that the whole work should be carried out according to one well-planued and thoroughly studied project, by and under the control of the Government. The investigations and improvements should uot be restricted to the mountains, but should include the valleys and the swamp and over-flowed lands. The money to do this work should partly be raised by the State and United States, and partly by a general State tax, which latter is justified as the permanent improvement of the navigable rivers will raise the value of property in the entire State. The hydraulic mines would be allowed to continue their work, but he restricted to a certain amount annually, which shall be determined from year to year in accordance with the amount of detritus. The water of the winter rainfall should be stored in reservoirs located in the mountains, and the water should be allowed to run off only in accordance to the carrying capacity of the rivers. The paper will be published shortly by the Technical Society in its proceedings and will be read with interest, showing, as it does the experience of other countries with a problem of great importance to us in California.

Bullion Shipments.

Day, July 8, $9,483; Horn Silver, 8, $18,000; Ontario, 8, $4,676; Hanauer, 8, $6,400; Stormont, 8, $3,985; Crescent, 8, $3,050; Hanauer, 9, $4,600; Horn Silver, 9, $12,000; Ontario, 9, $5,937; Horn Silver, 20, $9,000; Ontario, 10, $5,144; Hanauer, 11, $4,000; Horn Silver, 4, $3,000; Ontario, 12, $9,230; Bodie, 8, $6,346.46; Bonanza King, 11, $7,356.79; Contention, 11, $10,634.94; Navajo, 14, $8,000.00; Syndicate, 1, $7,603.76; Standard, 7, $6,829.74.

IMPORTANT additions are being continually made in Woodward's Gardens. The grotto walled with aquaria is constantly receiviug accessions of new fish and other marine life. The number of seations is increased, and there is a better chance to study their actions The pavilion has new varieties of performances. The floral department is replete and the wild animals in good vigor. A day at Woodward' Gardens is a day well spent.

MINING SHAREHOLDERS' DIRECTORY.

COMPILED EVERY THURSDAY FROM ADVERTISEMENTS IN MINING AND SCIENTIFIC PRESS AND OTHER S. F. JOURNALS.

TEN out of twelve jurymen found that the death of the twenty-three men at the Wellington Colliery, B. C., was caused by the culpable negligence of the foreman, John Knox, who has been arrested.

Mining Share Market.

Although, in the early part of the week, there was a brisk market in stocks, it has not continued, and prices have fallen off; still the market has been livelier than for some time past. During the 4th, 5th and 6th of July, the Chollar folks stopped work on their bulkhead, and allowed the Hale and Norcross folks to take and use the air when they went into the 2800 level and worked for three days. The developments made were such as give a better opinion of the ore formation at that point than anything that has yet been done there, and are encouraging for the future of the middle mines.

At the north end progress in sinking the Mexican winze is slow. The rock is a sort of a bastard quartz that breaks so short that blasts have very little effect.

On the 2900 level of the California and Consolidated Virginia work in the south drift has been suspended, owing to the appearance of water in the face, and the diamond drill is being sent ahead.

At the Best and Belcher, a west drift is being pushed forward jointly with the Consolidated Virginia, from which an upraise will eventually be made to connect with the drift that will be run out west from the 825 level of the Bonner shaft. This will form the beginning of very extensive explorations in the old upper levels of the Best and Belcher and Gould and Curry mines.

At Gold Hill all is going on about as usual in the leading mines. Sufficient ore is being extracted to keep all the mills on the Carson river in full blast.

Meetings and Elections.

JOHN HENRY G. and S. M. Co., Calaveras Co., July 8. W. C. Felch, L. A. Vogel, John Riley, J. H. Coyle, Milo J. Ayer, F. A. Morgan and Judge Jas. Galloway. At the subsequent meeting of the new Board of Directors, W. C. Felch was chosen President; John Riley, Vice-President; J. H. Coyle, Secretary; and M. J. Aver, Treasurer. It is the intention of the Board to commence operations at the mine immediately.

UTAH S. M. Co., July 10. Directors—Chas. H. Fish, President; R. H. Follis, Vice-President, and A. B. Hull; G. C. Pratt, Secretary; D. B. Lyman, Supt.

OVERMAN S. M. Co., July 12. Directors—W. W. Stetson, M. Schmitt, S. Heydenfeldt, Jos. Clark and R. Wegener.

BEST AND BELCHER M. Co., July 14. Directors—George Congdon (subsequently elected President); R. H. Follis, Vice-President; Robert Sherwood, Charles H. Fish, S. Heydenfeldt. The Nevada Bank, Treasurer; William Willis, Secretary; and H. Penoyer, Superintendent.

SAN FRANCISCO and North Pacific Railroad Co., July 14. President, Peter Donahue; Vice-President, J. M. Donahue; Treasurer, Thomas I. Bergin; Secretary, Thomas W. Johnston.

SAN FRANCISCO and San Rafael Railroad Co., July 14. President, Peter Donahue; Vice-President, J. M. Donahue; Treasurer, Thomas I. Bergin; and Secretary, Thomas W. Johnston.

SONOMA Valley Railroad Co., July 14. President, Peter Donahue; Vice-President, J. M. Donahue; Treasurer, R. H. Lloyd; and Secretary, Thomas W. Johnston.

Personal.

Mr. and Mrs. W. B. Ewer gave a wedding reeeption to their son, Mr. William C Luce and wife, nee Lillian Lloyd, at the residence of Mr. Ewer, 1516 Folsom street, last Thursday evening. The house was decorated with evergreens, smilax and flowers, while the lawn was brilliantly lighted with Chinese lanterns. The spacious parlors were canvassed, and music, daneing and singing enlivened the oceasion until tbe early morning hours. Several songs were beautifully sung by Miss Ella Lark, and an instrumental pieee brilliantly rendered by Miss Jennie Ward, who also favored the compauy with a song. A fine variety of useful and ornamental presents were made. A large party of friends congratulated the happy young couple, and we take this opportunity to extend our congratulations to them and hope that health and prosperity will lie in their path. Among the guests present at the reception were: Mr. and Mrs. A. T. Dewey, Mrs. Annie J. Lambert and daughter, Captain George Morehouse, Miss Eva d'Ancona, Miss Mamie Anthony, Mr. Anthony, Mr. d'Aneona, Mrs. R. C. Luce, Mrs. Frank Dagget and son, Rev. N. L. Rowell and wife, Miss Bartlett of New Bedford, Mr. Edwin Foster, Mr. and Mrs. J. J. Evans, Miss Eliza B. Ewer, Mr. and Mrs. H. K. Cummings and daughter, Miss Jennie Ward, Mr. Arthur Luce, Mr. Jireh Luce of Healdsburg, Miss Annie Volmer, Miss Laura Volmer, Mr. Volmer, Captain and Mrs. Freeman, Miss Chamberlain, Captain and Mrs. Gray, Dr. Cook and wife, Miss Cook, Miss E. Lark, Miss Allie Lloyd, Mr. Frank Crawford, Mr. George H. Bradshaw and wife, Mr. McCue, Mr. William Chisholm, Mr. Carl Chisholm, Mrs. Lark, Misses Laflin, Mr. and Mrs. Evans, Mr. and Mrs. Hoffman, Miss Noyes, Mr. Ed. Foster, Mr. Campton and lady, Mr. H. Muire, Miss Mary Daniels and sister.

New Incorporation.

The following companies have been incorporated and papers filed in the office of the Superior Court, Department 10, San Francisco:

AMERICAN POWDER CO., July 15. Object to buy and sell patent rights of all kinds. Capital stock, $1,000,000. Directors—George H. Harpers, John A. Carroll, L. H. Pockman, A. Rodgers and T. J. O'Keefe.

Cheap Ore Pulverizer.

There is for sale in this city, by L. A. Heald, American Machine and Model Works, 111 and 113 First street, a Rutherford Pulverizer, an improved revolving barrel crusher, which was only used a few times and is as good as new. It will be sold very much below costs, and miners who are in need of such an appliance for a small mine will do well to make inquiries concerning it. It is suitable for a pulverizing mill for powder or other substances. References as to above can be had upon applying to this office.

ASSESSMENT NOTICE.

Gould & Curry Silver Mining Company.

ASSESSMENT No. 48.

Levied.....June 18[illegible]
Delinquent.....July 11, 1884.
Day of sale.....August 4, 1884.
Amount.....Fifty cents per share.

PATENTS AND INVENTIONS.

List of U. S. Patents for Pacific Coast Inventors.

[From the official list of U. S. Patents in DEWEY & Co.'s SCIENTIFIC PRESS PATENT AGENCY, 252 Market St., S. F.]

FOR WEEK ENDING JULY 8, 1884.

301,557.—AMALGAMATOR—A. C. Bowen, Michigan Bluff, Cal.

301,561.—PRISMATIC TOY—S. S. Butler, Los Gatos, Cal.

301,562.—PRISMATIC TOY—S. S. Butler, Los Gatos, Cal.

301,605.—METALLIC PACKING—Thos. Johns, The Dalles, Or.

301,611.—CHANGE GATE FOR CARS—F. O. Landgrane, S. F.

301,619. AMALGAMATOR—P. McElligott, Bear Valley, Cal.

301,746.—PADDLE WHEEL—A. S. Morrison, Portland, Or.

301,828.—SAW MILL SET WORKS—A. A. Osborn, S. F.

301,629.—GRAPE CRUSHER, ETC.—P. Sainsevain, San Jose, Cal.

301,757.—SCARF RETAINER—J. Sandilands, S. F.

301,705.—HOOP IRON—A. J. Spicer, Portland, Or.

301,052.—WHIFFLETREE AND TRACE HOLDER—G. G. Wickson, S. F.

301,053.—FISHING MACHINE—T. F. Williams, Cascade, Or.

NOTE. Copies of U. S. and Foreign Patents furnished by DEWEY & Co., in the shortest time possible (by telegraph or otherwise,) at the lowest rates. All patent business for Pacific coast inventors transacted with perfect security and the shortest possible time.

Notices of Recent Patents.

Among the patents recently obtained through Dewey & Co.'s SCIENTIFIC PRESS U. S. and Foreign Patent Agency, the following are worthy of special mention:

PRISMATIC TOYS.—Samuel S. Butler, Los Gatos, Santa Clara County, Nos. 301,561 and 301,562. Dated July 8, 1884. This invention relates to a new toy in which a prism is adapted to refract the rays of light and throw them in widely distributed and varying prismatic colors. The invention consists in a prism having formed near each end suitable wheels or rolling surfaces, and properly mounted or journaled in a frame or handle, whereby it may be rolled along over an opaque surface or over a peculiarly arranged mirror or reflecting surface. The object is to provide a toy which shall combine instruction with amusement. In the second patent the inventor has a series of prisms mounted in a frame and arranged to be rotated on a common axis, said prisms to be used either with or without a reflecting surface or mirror over which they rotate. The toy is designed to be placed on a window sill, the mirror lying thereon. The room may be darkened and but little light admitted, except those rays which are caught by the prisms and the mirror. The prisms throw the colors over the walls, and the mirror increases their number materially. By rotating the prism frame the colors are made to travel rapidly, dancing about, varying in form and portion, crossing each others path and producing a curious and beautiful effect. The change of each prism on its axis provides for further adjustments, and any one may be set at the best angle to produce the best result.

CHANGE-GATE FOR CARS.—Frank O. Landgrane, S. F., No. 301,611. Dated July 8, 1884. A "change-gate" is designed to be applied to all doors of street cars and similar places where it is necessary to have an opening through which money may be passed and change made, and at which point it may be necessary to attract the attention of the driver or person who is to make the change. It consists of a gong secured between plates which are fitted from the opposite sides of the door, a hammer by which the gong is struck, a bell crank lever with a tripping attachment by which the hammer is operated; a gate hinge to the top of the plate to which the gong is fixed, having a double cam projecting upon each side at its lower edge and engaging the transverse head of a vertical moving rod or piston, the lower end of which engages and actuates the bell crank lever. In this invention, Mr. Landgrane has simplified the mechanism by which the operation is performed, and reduced the number of moving parts, besides making the apparatus dust-proof and more compact.

WHIFFLETREE AND TRACE HOLDER.—George G. Wickson, S. F., No. 301,652. Dated July 8, 1884. This improved draft bar or whiffletree and trace holder consists of two parallel wooden bars firmly secured a certain distance apart and at the same time held in that position by a draft link, clamping-plates and nuts. The ends are held in place by peculiarly-shaped swivel-hooks which also serve for the attachment of the traces and to hold them in such a position as to protect trees or vines from injury as they pass. The invention also covers a means for protecting the draft link or staple from wear and to act as a shoulder or stop when the nuts are turned up tight, without the necessity for forming shoulders upon the staple, By means of this whiffletree a flat leather surface is presented to the bark of the tree or vine and the danger of injury by careless plowmen or cultivators is obviated.

AMALGAMATOR. August C. Bowen, Michigan Bluff, Placer Co., Cal. In January, 1883, Mr. Bowen patented a peculiar amalgamator which we described at the time as consisting of a pan of considerable diameter, having its rim and center raised, so that there will be an annular channel with a curved bottom around the periphery, within which heavy balls are caused to travel by a rolling motion of the pan about its center of support. Mr. Bowen now patents, in combination with this, a mechanism for adjusting the angle of inclination of the axis of the pan, removable dies for the interior of the pan and certain other details of construction which perfect the amalgamator and render it more readily adjustable.

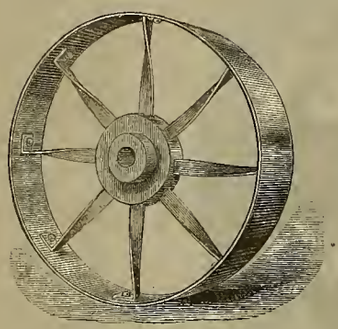
Iron and Machine Works.

MACBETH'S
—PATENT—
STEEL PULLEY.



Advantages of these Pulleys.

They are less than half the weight of cast-iron pulleys; are polished on the face; are made either crowned or straight, and are turned in the lathe the same as the best make of cast-iron pulleys.

They are carefully balanced. They are subject to no contraction strains, and can be run at very high speed without danger of bursting.

On account of their great lightness and the form of the arms, they absorb less power than any other pulley.

They are *the only pulley of the kind* which runs true. They cannot be broken in transport.

TESTIMONIAL:

MATHER LANE SPINNING CO. (Limited), LEIGH, ENGLAND, Nov. 5, 1883.

N. Macbeth, Esq.—Dear Sir: The Patent Steel Pulleys supplied throughout to our No. 2 Mill are working to our entire satisfaction.

They are very true, and are about 50 per cent lighter than the cast-iron pulleys in our No. 1 mill.

Yours faithfully,
For the Mather Lane Spinning Co. (Limited),
[Signed:] RICHARD T. MARSH,
Managing Director.

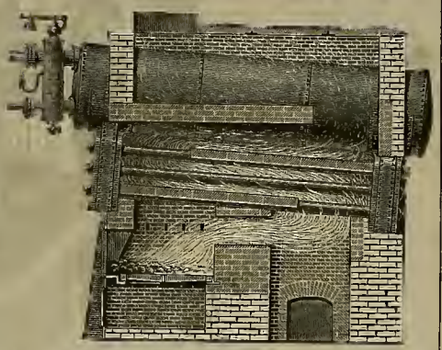
Economy in space and fuel. Safety at high pressures. Freedom from scaling. Equally adapted for power and heating purposes. Especially adapted for mills, factories, hotels, stores or any place where safety is a necessity. Will work well with muddy water and any kind of fuel.



TESTIMONIALS.

ST. LOUIS, Mo., Sept. 28, 1883

Messrs. Adolphus Meier & Co.—GENTLEMEN: We cheerfully certify that the "*Heine Patent Safety Boiler*" put up by you in our establishment has proved very satisfactory in its working. The chief points of excellence in the "Heine Safety Boiler" are its economy in fuel and space, freedom from scaling, aptitude for power and heating purposes, working equally well with clear and muddy water. We warmly recommend it to all using steam machinery. Yours truly,

ANHEUSER-BUSCH BREWING ASS'N.

OFFICE OF SUPT OF ROYAL RAILWAYS, BERLIN, Sept. 23, 1883.

To Mr. H. Heine, Civil Engineer: In reply to your inquiry of September 2d, we respectfully inform you that the three boilers built under your patents, under steam since September 25, 1881, at the Alexander Place Depot, as well as the two at Friedrich Strasse Depot, under steam since September 22, 1882, have given good satisfaction, requiring no repairs whatsoever to date. The internal cleaning of the boiler was always accomplished with ease on account of the convenient arrangement of the tube caps, the adhesion of scales being fully prevented thereby, and the boilers kept in prime condition.

(Signed): BRAUCKE.

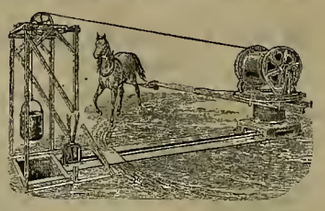
BAKER'S MINING HORSE POWER.



THE MOST EFFICIENT AND PRACTICAL MACHINE ever invented for the service of Prospectors and others requiring the use of a Horse Power; possessing all the requirements of a first-class hoist and affording means for the continuous operation of a Pump or Blower without interfering with a hoisting apparatus.

It is made entirely of Iron; no piece weighs over 250 pounds. At the ordinary speed of a horse a 1,000-pound bucket of ore may be raised 120 feet per minute. The hoisting drum is under the complete control of the man at the shaft, and is capable of carrying 500 feet of five-eighths steel rope. The cost of erection is slight, as two men in half a day can easily put it in place ready for work.

While this power is more particularly for mining purposes, it is equally adapted to all other uses where animal power is required. ☞SEND FOR CIRCULAR. Address

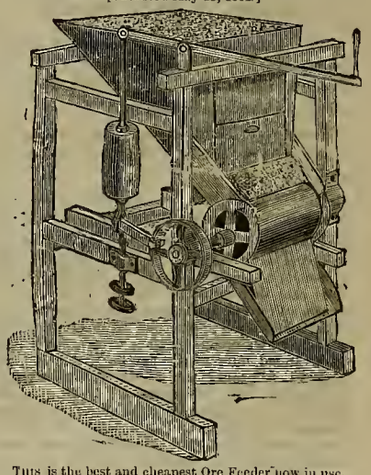
THE ROLLER ORE FEEDER

[Patented May 28, 1882.]



This is the best and cheapest Ore Feeder now in use. It has fewer parts, requires less power, is simpler in adjustment than any other. Feeds coarse ore or soft clay alike uniformly, under one or all the stamps in a battery, as required.

In the Bunker Hill Mill it has run continuously for two years, never having been out of order or costing a dollar for repairs.

THE FRUE ORE CONCENTRATOR,

OR VANNING MACHINE.

PRICE REDUCED, Jan. 1, 1884, to FIVE HUNDRED and SEVENTY-FIVE DOLLARS ($575.00).

OVER 800 ARE NOW IN USE. Saves from 40 to 100 per cent. more than any other Concentrator; concentrations are clean from the first working. The wear and tear are merely nominal.

A machine can be seen in working order and ready to make tests at the office of Hinckley, Spiers & Hayes, No. 220 Fremont Street, San Francisco.

To those Intending to Manufacture or Purchase the So-called "Triumph" Concentrator, we Herewith State:

That legal advice has been given that *all shaking motion* applied to an *endless traveling* belt used for concentration of ores is an infringement on patents held and owned by the Frue Vanning Machine Company.

That suit has been commenced in New York against an end-shake machine similar to the Triumph, and that as soon as decision is reached in the courts there, proceedings will be taken against all Western infringements.

That we are and have been ready, at any time, to make a competitive trial against the Triumph, or any other machine, for stakes of $1,000.

SAN FRANCISCO, SATURDAY, JULY 26, 1884.

VOLUME XLIX Number 4.

The Cummer Automatic Engine.

The Cummer Engine Company's Works, Cleveland, Ohio, has become one of the largest and best equipped institutions in the whole country.

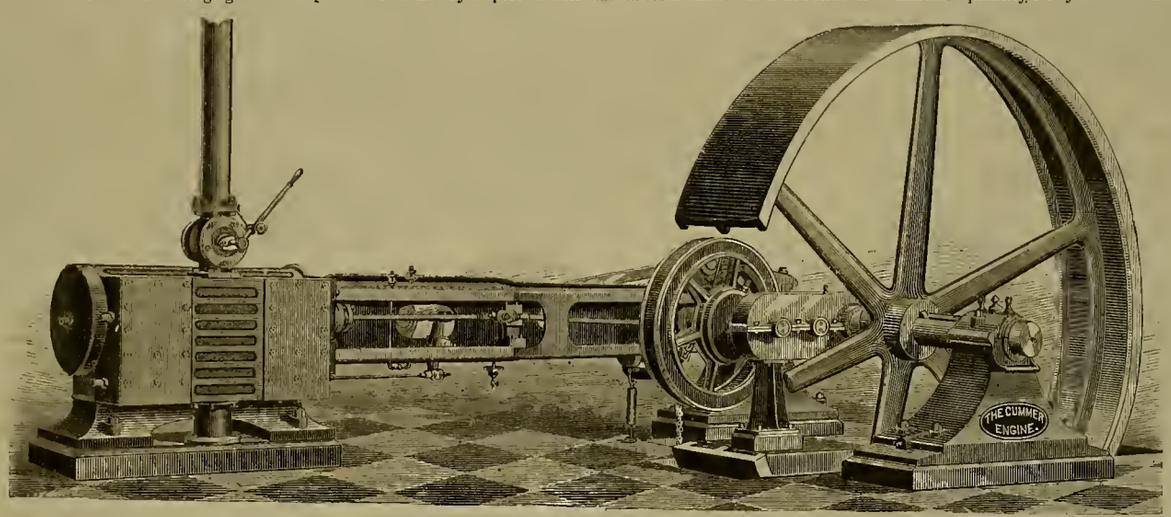
It has been but about one year since their large plant at Cleveland turned out the first engine. The shops were then thought to be equal to all demands that might be made on them, but it is no doubt a source of great pleasure to that company to be compelled to enlarge their works so soon, and to add the number of very heavy and fine tools which are now being built to their order. They have lately placed an order for three weighty lathes that will swing 5 ft. and for a large horizontal turning and boring mill, with a capacity to turn a pulley 20 ft. in diameter by 5 ft. face. This mill is to have a special feature in the shape of a slotting or key-seating device that will keyseat the pulley perfectly as soon as turned and bored, without ever moving from its center.

They are also putting in a very large steam hammer which will soon be in operation, and are again adding large and very durable buildings.

The Cummer Engine (one of the "class C" which is shown in the engraving on this page) has received the most careful attention from its makers, and every detail is as closely and critically constructed as good work can be. The templets and standa d gauges for every part of the engine are very complete and accurate. In the different departments, each part or piece of the engine is made to its templet, and when the pieces are assembled on the erecting floor, they accurately fit the places intended for them.

The Cummer Company report orders steadily on the increase, and say that the outlook for 1884 is very flattering. They claim to have the best automatic engine ever built. It is clear of trappy devices, as the cut plainly shows. The governor of this engine is a marvel of ingenuity, simplicity and durability. The remarkable promptness with which the governor acts and meets variable loads thrown on or off the engine is a source of great interest to even the best engineers.

From the fact that many large and influential manufacturing companies have been and are placing their orders for Cummer engines, the popularity of the engine is evidenced. The Pennsylvania Railroad Company have just placed their order for one of these engines, 130 horse-power, for their large shops now being built in Indianapolis, Ind. Before deciding, their experts made two separate tours of inspection, visiting the prominent engine shops and examining the different engines in operation and in course of construction. The fact that the acknowledged skill of the experts of this important company, in matters of steam and steam economy, has selected the Cummer engine is no doubt received by its makers with a great deal of satisfaction and pleasure.



THE CUMMER ENGINE.

Gravel Strike.

A correspondent in Downieville informs us that on the 19th inst. the Bald Mountain Extension Co. broke through the lava flow about 1,100 feet in width, the distance run by their main tunnel, now in quartz bowlders and gravel. Superintendent Lawry reports it fair for good pay. The people of Forest City are much rejoiced over the glorious discovery, and well they may be for it insures for them a prosperous future. It is supposed there must be ahead an uninterrupted rich gravel lead for miles up the ridge. At last the Extension Co. have the channel "cornered." If the lead continues straight ahead, in 500 feet it will cross the line into the Extension. Should the lead bend north, then it has about 200 feet to run to the Extension. The main tunnel is now underground over a mile, though turning at right angles. This is one of the most important discoveries made in this State for years, in its far-reaching results and possibilities for the future. Underneath the lava flow is believed to be a rich gravel lead that will be developed in time. The owners all feel much encouraged for the future.

L. L. Robinson, President of the State Miners' Association, says that the Association did not ask for an appropriation to appeal the Woodruff case to the U. S. Superior Court, from Nevada county, has not availed itself of the appropriation, nor is it certain that it will do so. Neither is it certain that the North Bloomfield Company will appeal as it is now drifting and will soon fit up its mine to hydraulic in such a manner, by filling up its old pit, as not to infringe the injunction.

The Del Monte mill is working ore from the Silver Lining mine, Aurora. The mill is now under the superintendence of Samuel McCurdy, who was long identified with the Standard-Bulwer mill, Bodie.

Land Officers Locating Mining Ground.

A Receiver of the Land Office in Oregon, as far back as 1873, took up a placer claim which in the following year he sold to certain parties who afterwards applied for a patent on it. The Commissioner of the General Land Office rejected the entry on the ground that its location by the local Land Officer was in violation of the regulations of the office.

It seems a circular of the Land Office, issued in 1876, prohibits Registers and Receivers from making entries of public lands on penalty of removal from office. It is doubtful if a mineral entry comes within the rule. But the Secretary of the Interior reverses the decision of the Commissioners because it would be an injustice to the entrymen. They purchased of the Receiver in good faith, for a valuable consideration, and in ignorance of the rule, and spent $500 on the claim. There was no evidence of improper conduct on their part. Moreover, the Receiver who was still retained in office, states that he made the location and sale in good faith, not supposing either to be in violation of any rule. Even if he knowingly disobeyed it, the Secretary is not of the opinion that the fact should effect the rights of grantees against whom nothing appears.

Austrian Quicksilver Works.—Mr. J. B. Randol, of the New Almaden mine, has had translated by Mr. S. B. Christy, instructor of mining and metallurgy at the University of California, a work on the Imperial Quicksilver Works at Idria, Krain. It was originally issued by the Mining Directory at Idria, in celebration of the 300th anniversary of the exclusive management of the mines by the Austrian Government. Mr. Randol has published the translation in a handsome manner. Next to the mine at Almaden, Spain, these mines have produced the greater part of the quicksilver used by the entire world for four centuries; and outside of the Almaden, in Spain, and New Almaden in California, it has still the largest annual product of quicksilver. The brochure contains a history of the mines, a description of the ore deposits, of the mining and ore dressing, the reduction and vermilion works, a chapter on production and profit, administration, etc.

Working for Themselves.

It is stated that in some parts of this State where the larger hydraulic mines have shut down owing to the decrees of the courts, the men, having no longer an opportunity to work for the companies, have been compelled to look out for themselves, and are really doing better than when working by the day. As the companies cannot use the water they allow it to flow to waste in its natural channels, and as a consequence many of the small streams are flowing that have not had any water in them in any quantity for years. Men could not work the ground near them for lack of water. Now, however, they have taken up, leased, or rented small pieces of land and are making better than wages. Where they used to work for $2.50 per day they can sometimes make from $4 to $5 per day when working for themselves. Of course it is not everywhere that this is possible, but it is the case in a number of places in the interior of this State. There is no reason that this should not be so. There are many places all over our mining regions where gold bearing ground remains alongside of the mountain streams, and the only reason why many of them have not been utilized is that the large companies have controlled the water. Now that they cannot use the water themselves and allow it to run to waste, there is no objection to others using it.

A very great advantage of miners working for themselves when they can do so is that the gold taken from the claims is kept or spent in the neighborhood where it is taken out. When the companies take out the gold, aside from what is paid out for wages and supplies, the yield all goes to the stockholders, who are frequently non-residents.

The money is not, therefore, of very much use to the region where it is produced, but with several hundred men who live in the mining region, all working for themselves, the money taken out is kept at home.

In several places river mining is now being carried on as it used to be years ago and before the big companies took steps to get all the water rights they could for their mines. A large hydraulic mine takes a great deal of water, and collects it from all available sources in the vicinity. Now, however, that many of these big mines have shut down, there is more water available for individuals who want to mine for themselves.

The project of erecting sampling works in Butte, Montana, has been abandoned. They will be erected at Dillon. Matthews & Webb think that smelting men of Butte would combine against them.

The Miners' Fund of New Almaden.

The following was read before the American Institute of mining engineers at Chicago Meeting, May, 1884, by Samuel B. Christy, of California:

At the last meeting of the Institute, several contributions were made to the subject of miners' aid funds. Such matters will always form important factors in the administration of large industrial enterprises. From the frequently remote and isolated position of mining properties, it is a subject that often forces itself upon the attention of the mining engineer. Local conditions are usually so variable that no single method can be found equally well adapted to all localities. At the same time, a study of different types is often suggestive and valuable, and it is with this in view that these notes are presented.

The Miners' Fund of New Almaden is a remarkably successful example of what may be done for miners by a wise and at the same time firm management, by simply directing their own efforts and without incurring any great expense to the stockholders,—a practical consideration not without importance in most cases.

The quicksilver mines of New Almaden are situated at a distance of fifteen miles by wagon-road from San Jose, the nearest town from which medical and surgical aid can be summoned. The great delay in case of accident and the expense in cases of long illness naturally gave rise to much difficulty in the early history of the mine. Physicians would charge a fee of twenty-five dollars for each visit; so that as a matter of mere economy, it was cheaper to die than to fall ill.

In order better to understand the conditions of the problem, a word as to the

Number and Nature of the Population

Will be necessary. The total number of men on the Company's pay roll at the mine and hacienda (reduction works) varies from 400 to 700 men. The total population is estimated to vary from 1,400 to 1,600. The last school-census showed:

316 children between 5 and 17 years at the mine.

105 children between 5 and 17 years at the hacienda.

The total number of minors was estimated at 600. By far the larger part of this population resides at the mine in the so-called "English Camp" and "Spanish Town," the rest live at the hacienda, all on the company's property. This population is largely Spanish-American. Nearly seventy-five per cent are of this origin. Most of these are Mexicans; a few are South and Central Americans. About twenty per cent. are Cornish miners and their families; the other five per cent. are Germans, Swedes, and other foreigners, with a few Americans. Two unsuccessful attempts were made to furnish

Efficient Medical and Surgical Aid

To the mine. The first attempt was made by the management as early as the fall of 1864, to secure the services of a competent physician. Each male adult at the mine was required to pay one dollar per month, in consideration of which he and his family were furnished with medical attendance and medicine. The whole sum collected was paid over to the physician, who gave his own time and furnished the medical supplies. Of course this innovation led to much opposition, complaints being made against the compulsory nature of the contributions; so that the scheme was abandoned after a trial of three months.

From that time till the Spring of 1870, the people were left to the tender mercies of local quacks, or were compelled to send San Jose as before. At the period named the need of a change was so strongly felt by the miners themselves, that a system of voluntary subscriptions was started among them. The plan this time was to pay over the whole sum to two competent physicians of San Jose, who agreed to visit the mine every other day, alternating with each other; they also agreed to furnish all necessary medicines and to come on odd days without extra charge in cases of emergency. This plan worked well at first; but dissatisfaction arose from the fact that many of the miners who were non-contributors still received nearly as much benefit as those who paid. By degrees, therefore, the number of contributors decreased until the fund became insufficient to pay the physicians; and so the second plan, that of voluntary subscriptions, failed.

The result of this experiment did much to convince the miners that compulsory contributions were necessary to make such a scheme a success: so that in the latter part of 1870, soon after the direction of the mine was assumed by the present manager, Mr. J. B. Randol, the miners were ready to petition that he assume control of the Fund, and that contributions be made compulsory. After convincing himself that this was the wish of a large majority of the employees and residents, Mr. Randol established what is known as the Miner's Fund, and assumed entire control as trustee. He has occupied this position for over thirteen years, without salary; and to his skillful management is due the high state of practical usefulness which the fund has reached, in spite of previous failures.

At the time he began the apparent future of the mine did not justify an additional expense on the part of the company; while on the other hand, it was equally evident that the fund should be in such a position that it could offer sufficient permanent inducement to a competent physician for him to abandon his regular practice and become a resident at the mine.

With these things in mind, the organization was effected, the rules and regulations of which have since been modified from time to time, as experience under the peculiar conditions suggested.

The rules and regulations now in force may be gathered from the following notice posted at the mine:

"Miners' Fund."

This Fund, instituted for the benefit of the residents of New Almaden, is established upon the following basis:

I.

Employees of the Quicksilver Mining Company, heads of families and all other adults residing at New Almaden, each pay monthly into said Fund, one dollar. The money so contributed is held by J. B. Randol, Trustee, to be paid out for the following purposes:

1. The salaries of a resident physician, and of a druggist, and for the purchase of medical supplies.

2. For relief of contributors whom circumstances may entitle to the same and for other contingent expenses.

II.

Contributors are entitled without further payment, to the attendance of the resident physician for themselves and their immediate families (except that cases of confinement will be charged five dollars), and will be furnished with medicines prescribed by him on payment of cost.

III.

When the Fund is subject to any expense for relief of persons indigent, or otherwise—say for medicines, nurses or supplies—it will be regarded in the nature of a gift, or as an advance to be repaid as the Trustee may decide to be just, considering the circumstances of each case.

IV.

It is expressly agreed that when the resident physician is called to attend any person not a contributor to the Fund, there shall be a charge of not less than five dollars for each visit, to be paid into the Fund and to be charged against and collected from the head of the house where such non-contributor may be living.

The Trustee serves without pay, and in consideration thereof it is understood that the foregoing rules and regulations will be observed by all persons interested therein; and it is expressly agreed that all sums due, or to become due, to the Fund by the contributors, or any of them, shall be a lien upon any property of the contributors at New Almaden, and upon any money due, or to become due, them for wages from the Quicksilver Mining Company, which money said Company is authorized to pay over to said Fund without further notice.

J. B. RANDOL, Trustee.

New Almaden, February, 1883.

The peculiarities of

The Large Mexican Element

in the population necessitated many of the changes which were made in the rules of the Fund as it was first established. For instance, at first, no charge was made for medicines furnished. But it was soon found that the Mexicans would often draw medicines to double the value of their contributions whether they needed it or not. A friend of mine, recently physician on a Mexican railroad, where the government requires that medical aid shall be furnished by the Company, says that the same difficulty is met with there and has occasioned him much perplexity, as it was frequently impossible to determine whether the men were really ailing or not. At New Almaden the difficulty was met by charging the medicines at cost price, as stated in Rule II.

Another difficulty arose from the fact that, in addition to the numerous blood relatives of a Mexican, he has numerous other connections such as *compadres*, *comadres*, etc. All of these god-fathers, god-mothers and god-children he regards as members of his own family. As a result, when these non-residents fell sick they were often imported for treatment at the hands of the resident physician as members of the family of a contributor to the Fund. This soon gave the physician more than he could do; and the place was turned into a health-resort with free medicine and attendance for the vicinity. This was the case of Rule IV, which, prescribing the fee of five dollars for each visit to a non-resident, at once put a stop to this abuse.

On account of national prejudices it was found necessary to maintain two seperate hospitals, one at "Spanish Town," and the other at the "English Camp." Nurses are paid from the Fund as required.

Whenever an Employee is Injured

While at his work for the company, no charge is made for any medical or surgical supplies furnished him; and if the needs of the case require it, he is furnished with nurses and boarded at the expense of the Fund. When solely dependent on his support his family is provided for during his illness in the same manner. The same is done for ordinary illness in deserving cases of destitution, and the advance is regarded as a gift or a loan, as the trustee may decide to be just.

In cases of fatal accident or the death of indigent persons, the burial expense is sustained by the Fund. It maintains a burial plot at the San Jose cemetery and also one at the hacienda, and another on a sandstone hill near the mine, which latter is not very popular among the miners for obvious reasons, although no one as yet has been discovered there.

The physician is paid a regular salary of $350 a month, and is required to make a monthly report to the trustee of:

The number of visits made each month.
The number of office prescriptions.
The number of vaccinations.
The number of obstetric cases.
The number of salivations.

A professional druggist is employed at the mine to attend to prescriptions; but, as he also acts as clerk for the mine, only the time he is actually engaged as druggist is charged to the Fund, at the rate of $25 per month.

The collections are made and accounts kept by the regular book-keeper of the mine, who receives a salary of $20 per month from the Fund. A complete

Record of the Fatal Accidents

During the last thirteen years has not been kept. During the last four and a half years there have been just nine, or an average of two per year. During this time there have been on an average 440 men employed; this would make an average of less than half of one per cent of fatal accidents per annum. It is a remarkable fact that in none of these fatal cases did the patients live long enough for treatment. In seven cases death occurred instantaneously, and in the other two within half an hour. Three of these accidents happened at the surface and six under ground.

During the last four and a half years the highest annual mortality from all causes was 15 per 1,000 inhabitants; the lowest, 11 per 1,000; the average, 13 per 1,000.

Cases of Salivation

Never occur at the furnaces at present, except through extreme carelessness. The chief trouble of this sort at the hacienda is from cleaning the condensers and working the soot. During 1883 there was no salivation at all at the hacienda. In previous years there has been more or less from the cause stated.

Formerly there was very little salivation in the mines, the cinnabar ores never giving any trouble of that kind. But at present, in working the rich *labores* of the 1600 and 1700 foot levels of the Randol shaft, which contain a great deal of native quicksilver, there has been some trouble from this cause. This ground is in places thoroughly impregnated with native quicksilver, a fragment of ore showing drops all the way from the size of a pea to microscopic globules disseminated through it.

Of course the air in such *labores* is pretty thoroughly saturated with quicksilver-vapor, in spite of all attempts at thorough ventilation. The chief source of absorption seems, however, to have been the skin. As the *labores* are rather warm, the men work by preference stripped to the waist. As a consequence, the dust, and probably the vapor also, is attacked by the saline matter in the perspiration, and introduced into the system through the skin. At least this is the theory of Dr. S. E. Winn, the resident physician; and that this is one important cause is substantiated by the fact that since he has insisted that the men be compelled to wear their shirts in the *labores* while at work the number of cases has diminished. Of course every attention is paid to bathing, and the use of tobacco in any form is forbidden in these *labores*. No deaths have been known to occur from salivation. The treatment follows the iodide of potassium method. Men disabled by salivation get half pay.

A Remarkable Fact

Is the facility with which the Mexicans recover from the wounds resulting from accidents or quarrels, while at the same time they succumb very readily to the attacks of disease. Their chief difficulty is with lung troubles, pneumonia, consumption and the like. This seems partly due to constitutional predisposition, but largely to their careless, reckless life. They will frequently come out of the hot *labores* after a day's work, and without change of clothes expose themselves to the weather or a night of dissipation. The Mexican miners, although occasionally very well developed, do not as a rule last as long as the Cornishmen. The latter being more particular about wearing dry clothes at the surface, and not exposing themselves recklessly, suffer much less from lung troubles.

The average age of the miners is 35 to 40 years, although some of them are 60 to 70 years old. A few boys and no women are employed in the mine.

The following summary of the monthly reports of physicians will give an idea of the amount of work done.

SUMMARY OF MONTHLY REPORTS, 1874 TO 1883, INCLUSIVE—TEN YEARS.

Number of patients visited at their homes	12,156
Number of patients visiting office	41,238
Number of vaccinations	729
Number of salivation cases treated	26
Number of confinements	209
Total cases	84,358

The following is a list of receipts and disbursements for the whole period during which the fund has been in existence:

NEW ALMADEN MINER'S FUND—RECEIPTS AND DISBURSEMENTS FOR THE THIRTEEN YEARS ENDING DECEMBER 31, 1883.

Receipts.

From collections	$80,447 30
From sales of medicine	2,484 00
From obstetric cases	1,280 00
From outside practice	98 00
From donations	24 75
From sale of horse	126 50
From loans repaid	345 00
From interest on deposit in bank	2,551 50
Total receipts	$87,357 05

Disbursements.

Salary of physicians	$47,711 00
Medical stores	13,283 11
Contributions to sick and disabled	4,019 24
Commissions for Collector and Secretary	3,842 34
Hospital nurses	2,748 82
Consultations, fees	1,648 00
Livery	1,425 78
Funeral expenses	865 90
Board of patients	736 65
Furniture	532 84
Surgical instruments	501 42
Office boy, salary	448 75
Incidental expenses	486 97
Loans	345 00
Subscriptions to medical journals and works	312 40
Disinfectants	252 92
Smallpox hospital	52 25
Collections refunded	27 50
Taxes	18 00
Fuel	15 22
Apothecary's salary	275 00
Total disbursements	$79,522 11
Deposits in banks	7,544 32
Cash at mine	290 62
	$87,357 05

The Company furnishes to the Fund at the present time a horse with stabling, and all the necessary buildings for offices, hospitals and dispensary and dwellings for physicians, free of expense.

If we assume the same rate for the whole thirteen years as for the last ten, as shown by the monthly reports during that period, it would make the total number of visits made or received by the physicians 109,665. The salary of physicians during this period was $47,711. This would make the actual cost to the members of the fund less than 44 cents per visit. This compared with twenty-five dollars a visit, the original cost, or even with the price that the inhabitants of large cities pay for similar service, is a very satisfactory showing. Now if we divide the total disbursements $79,522 11 by the total number of visits during the thirteen years, we have an average cost of 72½ cents per visit, including all expenses incurred by the Fund, such as medicine, nurses, loans, hospital-expenses, physicians salary and administration. All this has been secured practically without cost to the company.

To the Naturally Improvident Mexican

The establishment of the Fund has been of great value. The present arrangement saves both the miner and his family from considerable suffering in case of sickness or inability to work. The Cornish miners are usually more frugal, but they mostly have large families and get the full value of their contributions in the way of attendance during the year.

The Fund as now arranged seems well adapted to meet the peculiar conditions under which it operates with apparent general satisfaction. Dr. Winn, to whose kindness I am indebted for most of this information, tells me that during the four and a half years of his services at the mine he has heard of only two complaints. These were from two laborers who worked a couple of months on the roads, and did not happen to be sick while they were engaged. Considering the large and varied population, this absence of dissatisfaction is high praise for the manner in which the Fund has been administered.

Humboldt Niter Beds.

Colonel Birkedel, President of the Nevada Niter Company, organized for the purpose of working the niter beds in Elko and Churchill counties, has been inspecting the deposits near Humboldt Lake. On his way to San Francisco, a few days ago, in answer to an inquiry as to how the deposits here compared with those of South America, he informed the Reno *Gazette* that there is no resemblance. "The niter deposits of South America," said the Colonel, "are generally found in a crust of concrete called *caliche*, covering the surface of the more elevated spots of rolling plains, while here the niter is deposited in trachite and limestone, forming cliffs and hills often tinted by oxide of iron. You will understand by this that the niter was originally deposited in layers of heavy crust, and afterwards limestone was deposited over it, thus forming a cap. The niter beds of Nevada are far better situated for the development of its niter deposits than is the niter region of South America, which is a desert entirely devoid of water and all vegetable life. The development of its niter beds can therefore only be accomplished by surmounting difficulties. Provisions of all kinds must be furnished from distant countries. The water supply for all purposes must be condensed from ocean water and carried to the niter fields at great expense, while fuel has to be procured from the mountains in the south of Chili at great cost. While here the niter beds are in the vicinity of a rich farming country, with wood and water right at hand. We are, therefore, on an average able to produce niter, landed in San Francisco, at a much less cost than they are able to produce it in South America. We will be able to furnish all this coast requires, say 10,000 tons per annum, at a price that will net us $20 per ton profit." "How long will it be before you commence operations?" "As soon as possible, sir; our plans for machinery are all drawn, and everything will soon be ready."

CAPITALISTS are becoming interested in the mines of Plumas more than usual. The success of mines now operating, and the evident value of many of those owned by men too poor to operate them, are causing more attention to be given by the representatives of capital.

MECHANICAL PROGRESS.

Producing Compound Plates by Welding.

In compound plates, as heretofore manufactured from layers of hard and soft steel and iron, while uniting the hard material with the soft, and in the further manufacture of the plates when in a heated condition, a considerable proportion of the carbon passes from the hard to the soft layers. The object of manufacturing compound plates is thus to a great extent frustrated; furthermore, difficulties arise in the manufacture, because, according to conditions of temperature, more or less carbon passes into the soft layers, so that in many cases the requirements as to the amount of carbon to be contained in the plates are not obtained. To overcome this difficulty, Mr. F. A. Krupp, of Essen, welds between the hard layers and soft layers of compound plates a thin layer of such metal or metallic alloys as will prevent, or at any rate, much impede the passing of carbon from the harder into the softer layer. Such other suitable metals and alloys of metals as will, on the one hand, much impede the passing of the carbon, whilst, on the other hand, they will readily become welded to iron or steel or to chilled cast iron, are, for instance, nickel, cobalt, and highly silicious iron. He uses by preference sheets or plates of nickel, welded on both sides to sheets of iron, and thereby attains his object with a comparatively thin layer of nickel. The invention is applicable, not only to compound plates, but also to other articles which are composed of hard and soft kinds of steel and iron, and may be applied in various ways. As a rule, however, the conditions of temperature of the layers to be combined with one another must be so chosen that the intermediate layer is welded with the iron and steel, but is nevertheless not melted.

The simplest method of making such a plate is to make the intermediate plate as if it were a partition in the mold or form into which hard steel is poured at one side of the intermediate plate, whilst mild steel or homogeneous iron is poured in simultaneously at the other side. If it is desired to avoid the pouring in of hard and soft metal at the same time, then one material is first poured against one side of the intermediate plate, which is firmly fixed against the wall of the mold. The casting having congealed or set sufficiently, and being of suitable temperature, is then placed in another mold, and the other material is then poured against the other side of the intermediate plate. If, for instance, the compound plate is to consist of annealed or puddled iron and cast steel, then the welded plate, when it was being welded for the last time, has for its inside last layer welded to it, for example, a sheet of nickel, having welded on both its sides sheets of iron, and then casting on the other side of the welded plate a layer of steel in any convenient manner. Or the intermediate plate may be of highly silicious iron. The manner in which the process or invention must be modified, when the plates to be manufactured are to consist of several alternate layers of hard and soft material, is obvious.—*The London Mechanical World.*

A Mechanical Dictionary Needed.

There seems to be need for a dictionary of shop terms as well as of accepted scientific mechanical terms as applied to practice. Even in our most popular technical periodicals the terms used by a contributor from one portion of the country are sometimes unmeaning to readers in another portion.

Lack of definiteness is one of the faults of our mechanical nomenclature. In a recent publication of a mechanical paper, the question whether "spline," "key," and "feather" are synonymous was presented. Perhaps this will be as good as any other instance of our lax system or lack of system. In the shop talk where the writer was "raised," a "spline" would mean a fixed projected portion retained in a shaft and not specially connected with the pulley or hub. Its synonym would be a "feather." A "key" would be a wedge shaped fastener, with or without a head, fitting corresponding channels in the shaft and the hub, intended to secure the latter at some exact point. And yet "spline" and "key" are used indiscriminately by good mechanics. So long as the appellations are understood to have a definite meaning they have their value; but this value may be confined to the shop, to the section of manufacturing establishments, or to the manufactories where persons mainly of one nationality are employed; outside they may be confusing.

In shop use why should a cylindrical rod of metal be at one time a "bar," again a "shaft," a "spindle," an "arbor"? Or if so used, why not have a shop thesaurus or lexicon that would give the derivation of the words and the reasons for their use? A "bar" shows its origin; it means to hinder, and is applicable to iron only in bars which may be used as obstacles. A "spindle" is derived from the spinning flax spindle older than our civilization, which supposes a tapering shaft rotating on its own axis. "Shaft" comes from our Saxon schaft, an arrow, implying straightness. "Arbor" comes from the Latin, a tree, or a piece to which something may be temporarily affixed.

A "mandrill" is a hand (*manus*, *L.*) drill. Is the clearer of bored holes a "reamer" or a "rimmer"? Is the top of a machinist's hammer a "peene," "pane," or "pene"? Why a "broach"? Why "drift pin" and "tamp pin?" The suggested glossary ought to contain the information that the ordinary screw jawed wrench is not a monkey wrench because of any peculiar tricks it plays in use, but simply because Thomas Munkey, an English mechanic, invented it. Many other suggestions might be made to the ambitious mechanic who will undertake to simplify our mechanical nomenclature by the compilation of a dictionary and glossary of mechanical and shop terms.—*Scientific American.*

Recovering Tin from Scrap Tin.

Various methods have been devised for recovering tin from tin scrap, either with or without any attempt to further utilize the waste, by also saving the iron. A late English technical journal describes still another and new process from which the following points are gleaned:

"Melting the scrap gives only a spongy iron, and the extraction of the tin by the action of acids of chlorine gas is too expensive, so that hundreds of tons of this material are wasted every year, and all the experiments to save it appear to prove abortive. The latest experiments, however, seem to promise a cheap method of recovering both the tin and iron in a pure and useful shape. The tin scraps are placed in a furnace where the temperature and the supply of air can be carefully adjusted. This gives a roasting in free air that causes the film of tin on the iron to oxidize. The alloy of tin and iron under the film of tin is next oxidized, and then the scrap is taken from the furnace, and the coating of oxides on the iron is shaken off by simple machinery. This leaves the iron in a comparatively pure state, while the powdered oxides may be smelted with other tin ores, or, as is preferred by the inventor of the process, they may be submitted to the action of hot sulphuric acid, which dissolves the oxide of iron, leaving the tin untouched. The tin may then be separated from the solution of sulphate of iron and melted, while the solution may be evaporated to dryness, and then placed in retorts to recover the sulphuric acid, the residue in the retorts being valuable in making paints. The waste heat from the retorts is used to assist in roasting the scrap, and in evaporating the solution of sulphate of iron. Waste fruit tins are first roasted to remove the solder that may cling to them, and are then treated by the same process. The process is one that it may be hoped will save a great deal of money now lost without recovery, and do much to rid manufacturing cities of many unsightly heaps of refuse.

ATTENTION INVENTORS.—Robert Sinnicksou, of Trenton, N. J., writes to the *Scientific American* of June 28, 1884, as follows:—A serious accident in this city, this afternoon, from blasting rock, in excavating for the foundation of a new building, suggests the query whether some safer method than blasting may not be invented, for excavating in thickly populated cities. As crosscut saws are used for sawing stone in the yards, it occurred to me that circular saws, with both horizontal and perpendicular movements, might be used for cutting stone in its native bed, into small cubes, which might be used for building purposes. As similar accidents are following each other so rapidly in different parts of the country, it becomes philanthropists to agitate the subject, while it would probably pay inventors to consider it from a practical standpoint of view. Some practical invention is evidently needed for such excavations, and there ought to be inventive genius enough in the nineteenth century to produce it.

WHEN A CASTING IS VERY THIN, even if of soft grey pig, it is often as hard, even though run in sand, as if cast in a chill. Such castings may be annealed, so that the surface may be worked, by putting them in boxes and raising the temperature to redness. In the cast of gray iron the castings are surrounded with coarse sand, and heated for 48 hours; but in that of white iron they are surrounded by a mixture of one part of sal-ammoniac and twelve parts of hammer scales, and heated for 24 hours. This length of time is sufficient to soften the skin; but if the operation be continued for a week the castings will become malleable.

WINDMILLS still hold their own for many useful purposes. In fact, of late years, by reason of the numerous improvements which have been made in them, they have come more than ever into general use. In this connection it may be interesting to notice the fact that a competitive trial of windmills will take place at the Pennsylvania State Agricultural Fair the coming fall. The trial is to take place in Philadelphia, from September 8th to 20th. Mills may be erected after August 1st. There will be no charge for space, which is limited to ten feet diameter from out to out, of wings. Water will be furnished free.

KAOLIN FOR BOILER LAGGING.—A correspondent of the *American Machinist* says that the white clay or kaolin found in many parts of the South is used for boiler lagging with excellent results. He says: "I have seen locomotives covered with it placed in the house at 10 P. M., with 130 pounds of steam, and without fire, which showed 60 pounds of steam the next day at noon." The clay is mixed half and half with plaster paris, with jute to hold it in place. There are whole acres of kaolin deposits in this and Grass Valley townships.

SCIENTIFIC PROGRESS.

Oxygen in Water.

In a lecture delivered by Dr. William Odling, F. R. S., at the Royal Institution, on "The Oxygen in Water," the lecturer began by stating that in 1823 Faraday proved that a gas or vapor is nothing but a liquid at a temperature above its boiling point, and exhibited a number of glass tubes containing liquefied gases, which had been prepared by Faraday, who liquefied nearly every known gas. It is only within the last six years that the five or six gases which had previously resisted liquefaction have been reduced to that state by perfected modern appliances for producing cold and pressure. At the present time a chemist in Paris is making liquid oxygen by the pound. The speaker said that when gases are dissolved in water they somehow assume the liquid state therein, and increase the bulk of the water. At 0° C. 100 volumes of water dissolve 4.11 volumes of oxygen gas; at 15° C. they dissolve 2.99 volumes. At 0° C. 100 volumes of water dissolve 6886.10 volumes of sulphurous acid gas, and at 15° C. 4356 50 volumes; 100 volumes of water at 0 C. dissolve 114,800 volumes of ammonia, and at 15 C. 78,270 volumes. Water at a temperature of 7 C. dissolves 2,199 cubic inches of oxygen per gallon, and at 21° C. 1,797 cubic inches per gallon. The barometric pressure has a feeble influence in causing variation in the amount of oxygen absorbed by water, the variation not exceeding a small fraction of a grain per gallon; yet in a large river that means a variation in the quantity of oxygen to be measured by tons. River water in summer contains about 4 grains of oxygen per cubic foot, and about five grains in winter.

In August, 1859, Dr. W. Allen Miller ascertained the proportion of oxygen in the Thames at low water, and found that as the Thames runs through London the quantity of oxygen in it diminishes as compared with the proportion it contains at Richmond; and discovered that about 12 or 13 tons of oxygen are lost between Richmond Bridge and Somerset House. Other chemists have since taken up the work, and their results agree tolerably closely.

One method of testing the proportion of oxygen in water is by means of hyposulphite of soda. The hyposulphite of soda used in the analysis of water bleaches the ammoniacal solution of oxide of copper; it also deoxidizes indigo, magenta and iodide of starch. White indigo is made blue by the air in water, but does not do so if hyposulphite of soda is put in the water first to absorb the oxygen. When water is made blue by indigo, and hyposulphite of soda is added, the latter has the choice of two substances from which to absorb oxygen, and it deoxidizes the air in water first; hence the quantity of hyposulphite used before the liquid is bleached affords a method of measuring the proportion of oxygen in water. When the liquid is just bleached by adding no more hyposulphite of soda than is necessary for the purpose, it can be made blue by pushing down air into it, or by pouring it from one vessel to another.

Tests of the Thames water show that near the sewage outfall it contains about ½ cubic inch of oxygen per gallon, instead of 2 cubic inches per gallon, which it contains before receiving the sewage; but lower down the proportion of oxygen rises again, until the water is within 10 per cent of its richness in oxygen at Richmond.

OZONIZED AIR.—A novel and somewhat curious apparatus is about to be placed in a German hotel for the generation and diffusion, throughout the hotel, of ozonized air. It will be connected with a special system of ventilation which will be properly arranged throughout the structure. The air to be ozonized is passed by means of a fan driven by a water engine, through a chamber or generator, within which is a series of 50 glass plates fixed close together and coated with tinfoil strips, so as to constitute metallic gratings, and across the interstices of these gratings, the discharge of a large Ruhmkorff induction coil is passed in a multitude of little sparks. The induction coil is one of high insulation and capable of giving a spark in air between its terminals of 15 inches. Under the system of ventilation adopted at this enterprising hotel, the ozonized air is conveyed to the large *salons* and the theater, and is not only warmed to the required temperature, but is charged with aqueous vapor so as to maintain the saturation corresponding to that temperature at a healthy degree of humidity. By means of suitable valves, air properly warmed and charged with aqueous vapor and ozone can be turned into any room at the rate of from 2,000 to 3,500 cubic feet per hour for each individual.

EXTINCTION OF PLANTS.—The imminent danger of extinction which threatens many of the rare plants of the Swiss Alps has led to the formation of a society for their preservation. On reading the account of this society presented in another column, the question naturally arises, Are any of our rarer species likewise in danger of extermination? With the exception of the extensive raids which are annually made upon some of our native plants by herb collectors (and it must be understood that this business has assumed very considerable proportions, especially at the South), there are no very large drafts made which imperil the existence of the less common species. To be sure, in a few localities the mayflower and the climbing fern have been extirpated by the greed of collectors for the market; but it can hardly be said that these beautiful species are yet in peril. The same is true of the medicinal plants, ginseng and mandrake. It is fortunate that most species collected for medicinal purposes are reasonably prolific, and will doubtless hold out until those now in fashion have been discarded by other aspirants for popular and professional favor.—*Science.*

CURIOUS EXPERIMENT. Among the results of Dr. Guthrie's experiments concerning solutions of salts is, that as a mixture in solution cools, the salt which is present in richest quantity crystallizes out until a certain critical point is reached. Dr. Guthrie has shown that certain alloys of metal, such as the more fusible alloys, which melt at low temperatures, behave in the same way as mixtures of salts. Moreover, there seems to be no definite molecular proportion obtaining in these alloys: A mixture of 47.38 parts of bismuth, 19.97 of tin, 19.36 of lead, and 13.29 of cadmium fuses at 71 degrees Cent., or a little less than 160 degrees F., or in boiling alcohol. This is still a lower temperature than the fusing of Rose's fusible metal. Dr. Guthrie has also shown that definite mixtures of water and triethylamine become turbid at or between certain temperatures, and on this basis he has constructed a set of temperature tubes containing the mixtures in question. When placed under the tongue of a patient the temperature of the body at that point can be ascertained by their means.

MEETINGS OF THE BRITISH AND AMERICAN SCIENTIFIC ASSOCIATIONS.—As the British Association for the Advancement of Science meets this year at Montreal, from August 26th to September 2d, the American Association meeting will be held at Philadelphia, September 4th to 10th, to enable members of the two Associations to attend both meetings, and allow of the interchange of courtesies between the members. Fellows of the American Association are invited to join in the meeting at Montreal as honorary members, and those of the British Convention at Montreal are invited to take part in the Philadelphia meeting. Under those circumstances, both meetings are expected to be very fully attended, and the exercises unusually interesting. A series of receptions will be offered the Association at Philadelphia, and its guests, including one at the Academy of Music, after the President's address. The botanical section of the Academy of Natural Sciences will organize botanical excursions, and also hold a special meeting at the Academy for botanists.

INTERESTING OBSERVATIONS.—J. Aitken of the Royal Society, Edinburgh, employed the following experiments in illustration of the tendency of dust to move from hot and to deposit itself upon cold surfaces: Two mirrors, one hot and the other cold, fixed face to face and close to each other, were placed in a vessel filled with a dense cloud of magnesia, made by burning magnesium wire. After a short time the mirrors were taken out and examined. The hot one was quite clean, while the cold one was white with magnesia dust. In another experiment a cold metal rod was dipped into some hot magnesia powder. When taken out it had a club-shaped mass adhering to its end, while a hot rod attracted none. This tells us, among other things, why the walls and furniture of a stove-heated room are always dustier than those of a fire-warmed one. In the one case the air is warmer than the surfaces, and in the other the surfaces are warmer than the air.

THE COLOR OF INSECTS.—The relation of light color in the evolution of species of insects has been discussed by G. Lewis, who is disposed to attribute the origin of the colors of insects to the sun's rays rather than to sexual selection. He supposes a process by which the various rays or wave movements from the sun impress living organisms with the structure necessary for color, and terms it "photoplasticity," basing his supposition on the alleged sufficiency of this mechanical theory of the action of light to explain the phenomena of color. After giving many instances from the Insecta, of protective coloration, he speaks of Larahas, where the coloration is not protective, and states his belief that the latter are due to the sun's action.

THE AERONAUTICAL LEGACY, to which we have already referred in these columns, has actually been made, but it is in such terms that it is doubtful that it can be legalized. Mr. Ritchel, in whose special interest it was made, has not as yet received any portion of it, and he is not sanguine of obtaining a dollar from this source. The gentleman who thus showed, in his will, his interest in the experiments of Mr. Ritchel, had, during his life, voluntarily aided him with funds to a small amount, but at present Mr. Ritchel's costs are borne by himself.

NEW NEBULÆ.—It is claimed that over one hundred and fifty nebulæ which have escaped the vision of previous astronomers have recently been discovered by Dr. Lewis Swift, Director of the Warner Observatory, Rochester, N. Y. One of these is of a most peculiar nature, and seems to be undergoing a wonderful change.

TABLE OF CONTENTS.

EDITORIALS.—The Cummer Automatic Engine; Gravel Strike; Land Officer Locating Mining Ground; Austrian Quicksilver Works; Working for Themselves, 49. Passing Events; After Mining Machinery Inventors; Splitting Air Currents in Mines; The Judson Manufacturing Co.; Inspection of Mines, 52. Indians Near the Colorado Canyon; Gravel in Placer County; Wrought Iron and Steel in Construction; Gravel Mining; Two Lodes in One Application for Patent, 53.

ILLUSTRATIONS.—The Cummer Engine, 49. Indians Near Colorado Canyon, 53.

MECHANICAL PROGRESS.—Producing Compound Plates by Welding; A Mechanical Dictionary Needed; Recovering Tin from Scrap Tin; Attention, Inventors; Windmills; Kaolin for Boiler Lagging, 51.

SCIENTIFIC PROGRESS.—Oxygen in Water; Ozonized Air; Extinction of Plants; Curious Experiment; Meetings of the British and American Scientific Associations; Interesting Observations; The Color of Insects; The Aeronautical Legacy; New Nebulæ, 51.

ENGINEERING NOTES.—The Panama Canal; A Great Railroad Event in South America; The Mersey Tunnel; The British Channel Tunnel Project; Connecting the Baltic and North Seas, 55.

USEFUL INFORMATION.—Hand and Machine Made Putty; Measuring Standing Grain; How Annealing Makes Metals, etc., Pliant; Vertical Flight of Bullets; An Original Rat Trap; Ancient System of Weights; Vehicles a Hundred Years Ago; Water-proof Shoes, 55.

GOOD HEALTH.—Indigestion; Hops as a Remedy Against Disease; The Growth of Human Beings; How to Keep Thin; Borax for Hoarseness, 55.

MISCELLANEOUS.—The Miners' Fund of New Almaden; Humboldt Niter Beds, 50. The Block System of Underground Prospecting; Working Iron Beach Sands; Gold Chlorination in California; Shipping Ores to Kansas; The Tanite Co., 54.

Business Announcements.

Passing Events.

There is not much of general interest to report from the mines, if we except the strike of gravel in the tunnel of the Bald Mountain Extension Company, Sierra county, in this State. The new town of Belknap, in the Coeur d'Alene region, Idaho, was burned up on the 18th, only five houses being left. The loss is set at $100,000.

The rescue of the Greely Arctic exploring party by the relief expedition was a timely one, the few that were left of the party being nearly starved to death. Many of Greely's men died from starvation, but he succeeded in getting nearer the North Pole than man ever went before. As far as we can learn, no very remarkable scientific results followed the work of this expedition, though open water was seen to the north of their farthest camp.

The cholera still prevails in France and Italy, though it has not come to this country. The President has issued a proclamation urging sanitary precautions on the part of citizens of the United States.

By the terms of the new arrangement between the railroad companies, the Southern Pacific sold to the Atlantic and Pacific its Mojave division, 240 miles in length, extending from Mojave to the Needles, and conceded to the Atlantic and Pacific the right to run its trains from Mojave to Oakland pier, a distance of 382 miles. By this contract the Atlantic and Pacific, which is owned jointly by the Santa Fe and St. Louis and San Francisco lines, extends its road to Mojave, and thus secures the right to run its trains virtually into San Francisco. The California Southern, now reaching from San Diego to San Bernardino, 130 miles, is to be extended to a junction with the Mojave division. It will then be formally transferred to the Atlantic and Pacific, which will thus be extended to the bay of San Diego.

After Mining Machinery Inventors.

A short time since we had occasion to call the attention of inventors to the many traps set for the unwary of their number, and of the numerous designs on their pockets which had been perfected by unscrupulous men. In most cases some plausible plan is set forth showing him it would be to the advantage of inventors to send on plans or models, accompanied by a fee, but there is never any mention of the possibility of the inventor getting the fee back again.

What appears to be an old idea in a new form has just come to our attention, and it is in such a shape that many may be induced to send the fee asked for without much thought of the matter. A circular has been issued by a committee of the Blank Consolidated Mining and Smelting Company, of Cincinnati, Ohio, in which attention is called to the great value of the mines of the company, which are in Colorado. This circular is sent to inventors of mining machinery and appliances all over the United States, the names and addresses, with dates of patent, having doubtless been taken from the Patent Office reports. The committee offers to send a prospectus of the company, and asks inventors to send their machinery to them if they wish to secure the practical introduction of the patent.

The circular says in effect that the directors of the company, after mature consideration, have agreed to adopt the latest improvements in mining machines and implements for the purpose of developing their several valuable claims to the greatest advantage. A committee has been appointed to report on these patented improvements; and, in order to select intelligently, they are authorized to call on owners of patents for models or drawings and specifications of their improvements. The company has decided to offer a premium of $500 cash for each patent which is adopted for use on its properties, and sets aside enough non-assessable stock to give each competitor twenty-five shares, value $10 per share. The object in transferring these shares to the inventors is to reimburse them for time and trouble, and to secure such a body of men as members who will co-operate intelligently with the directors in the management of the company.

The committee is empowered to charge each competitor an entrance fee of $15 for expenses of clerk hire, rent, etc. The fee must be forwarded with the models or drawings, and be there before the 1st of August. On choice being made, the inventor must sign an agreement to let the company use his invention in their mines, this to be delivered on payment of $500. Tags are sent ready addressed to the committee, and the inventor is again cautioned to prepay all models and send the $15 fee with them. They also ask for full names and correct address, so the stock may be properly transferred and forwarded.

This is quite an ingenious little scheme, and no doubt that committee will receive a number of $15 fees. It is not probable, however, many makers or inventors of mining machinery, furnaces, etc., on this coast, will send on any fees for the chances of getting wild-cat mining stock and a somewhat mythical $500. This is another one of the plans to get a large number of small fees from a large number of inventors, so as to roll up a goodly sum for some one. Paying out $500 or $2,500 for machinery or premiums on such a basis as this would be a good thing—for the promoters. But any inventor who sends money to people on such a slim chance of getting anything back as is set forth in this circular, will find he has been fooled, in all probability. It looks like another trap for inventors. At all events, owners of patent rights, before forwarding money to unknown persons, will do well to investigate the standing of the concern they are supposed to represent. The circular has apparently been sent broadcast to inventors of mining machinery, and they have evidently gone way back in the Patent Reports for addresses. The circular shown to us gave the date of the patent for the amalgamator in 1881, and the whole thing was printed except the name of inventors, class of invention and date of patent. Mining machinery inventors are cautioned to be wary of such schemes.

THE Oreana mill, formerly belonging to the Evening Star Co., is being moved to Paradise, Nev., to work ores from the Live Yankee mine.

Splitting Air Currents in Mines.

The splitting of the air current of a mine, when not carried to extremes, is advantageous, as it secures a greater volume of air at the expense of the same motive power. The different divisions of a mine are never equally developed; and, if proper care be not taken, districts requiring the most air will receive only a small portion, while other districts requiring but little will receive large quantities. Common sense suggests that of the two developed districts of a mine, the more developed of the two should receive the large quantity of air; the air should be therefore distributed in a systematic manner, basing the quantities for each district on to the number of bends, extent of rubbing surface and other resistance. This aim is attained by the "sliding shutter" which, being placed so as to admit a small volume of air, causes whatever excess there may be to pass into other parts of the mine where the air is more needed.

It may happen that in a coal mine a "blower" of gas is met with which renders the air explosive in its district. When it is perceived the regulators should be immediately opened and a greater circulation produced, in order to carry away the inflammable gas. During this time work in other districts need not be necessarily stopped, unless it is found necessary to pass the whole current through the dangerous district.

If the gases be given off in such quantities that an explosion takes place before the miner perceives the explosive state of the air, the workmen in the other districts will be protected from the flame of the explosion, and the "after damp" will only momentarily check the current; and if the return airways are of large sectional area and no great length, the current will scarcely be interrupted, save perhaps in the district where the explosion occurred, the doors and regulators of which may have been destroyed.

To increase the ventilating pressure, or lessen the extent of rubbing surface, is a costly manner to increase the ventilation; but by judiciously dividing the current and evading it with several air-ways, the circulation will be much more active than if only one continuous current were used. In Mr. Wilson's recently published work on "Mine Ventilation," formulae presented prove "that the resistance to the motion of the air in a mass requires in a single current, a motive force sixty-four times greater than when the air is divided into four currents of the same sectional area and aggregate length." The same is said to be true for bends and contractions that require a motive force equal to the square of the volume of air circulating in each district. By splitting the air current, or leading it off from the downcast into the different districts to be ventilated, we obtain purer air for each district; for each split takes its fresh air directly from the downcast. We obtain more air also by decreasing the velocity, thus lessening the friction.

The Judson Manufacturing Co.

The extensive works of the Judson Manufacturing Co. are at Emery Station, Alameda Co., between Oakland and Berkeley, on the line of the C. P. R. R. The enterprise is a very prosperous one, and pays regular dividends to its shareholders. The plant is one of the largest of any manufacturing establishment on the coast, and is being constantly added to. There are a number of departments, presided over by skilled foremen, all under one general superintendence, however, and each department is separate in itself. The works are run on a careful system and in a very business-like manner. The products are favorites in the market, owing to the excellence of the standard established and maintained.

One of the products worthy of special notice is the California Victor mowing machine, well known on this coast. Another is Beauregard's patent channel-iron harrow. Mr. Beauregard, the patentee of this harrow, has also patented and put in use at these works a machine for straightening and smoothing round bar iron, by which the trade of the company in that line of goods has been increased to four times its former dimensions. This machine smoothes and straightens the iron, and fits it for shipping, saving the expense of the old process of straightening, and has given the Judson Co. a great advantage in the manufacture of bar iron for shafting.

Inspection of Mines.

As we have before observed much greater attention is paid in Europe than in this country to official inspection of mines. In Great Britain and on the Continent the government exercises functions in this respect which our government does not. There they have government inspectors who attend to certain stated duties in this connection. Last month representations of the miners of all parts of Great Britain waited on a committee of Parliament to urge the appointment of additional inspectors of mines. The memorial of the deputation set out that although the production of coal was last year one-third greater than in 1872, there had been no increase in the number of mining inspectors. The tendency of the present day was to engage in operations which rendered inspection much more important than formerly, and it was represented that the pressure of duty did not enable inspectors to give to individual cases that attention which was desirable in order to secure as far as possible immunity from accident. It was therefore asked that there should be a reasonable increase in the number of government inspectors.

The deputation also addressed the Home Secretary, and a portion of his reply is worthy of reproduction: He said, "Everybody knows that all the motive power of all the industries of the country is mainly to be found in coal, and that therefore those who get the coal are among the chief springs of the industry and wealth of this country. I am also aware—I am obliged to be so officially—of the great risks and dangers of that trade and the melancholy loss of life that frequently occurs in it. Now with reference to what has been said as to inspectors, I have myself sometimes thought that there was a very reasonable claim for an increase of inspection, for this reason—that unquestionably the output is much larger, the workings are more extensive, the depths at which the coal is obtained are greater than they used to be.

"There has been a demand made that these inspectors, or a portion of them, shall be practical men. I think that I have not been insensible to that, and that in other departments of inspection I have shown that I desire first of all, that men practically acquainted with the work should have a share in it. But I have another and larger reason—I think that all classes in the community, and especially those who themselves take part in those industries, should have a share in the civil service of the country. Having said this to you, I must ask you not to expect the government to do the work which ought to be done by others. Do not expect too much from the government. If the government were once to undertake the main responsibility—the daily, hourly responsibility, which alone can make a trade of this kind safe—they would utterly fail. They would destroy the responsibility of those people upon whom it must eventually rest, because once allowed the owners and managers of mines to say, 'We have had an inspector here; it is not our fault, and he has approved of what is done'—it would destroy, in point of fact, that responsibility which must be the main safeguard of carrying on a business of this description.

"You must not expect that government inspection can take the place of that responsible care which must devolve upon the parties who have charge of the mines; and it would be a very great evil if you went so far as to destroy that responsibility, because you all know, especially persons from South Wales, where there are fiery mines, that a mine that is safe to-day may be very dangerous to-morrow, and that after the inspector is gone a single pick may bring out a piece of coal which may let out gas and make absolutely dangerous the mine which, a day or a week before, was safe as far as human skill and foresight could make it. There is another thing which I am sure you will excuse me for speaking quite frankly about, and in which I would ask the miners to help us. I have had—I will not refer to particular men—cases where the inspectors have reported to me that certain precautions were necessary, such as locked lamps, and, of course, I had no other course left me but to say that the inspector had reported to me that locked lamps were necessary, and that the locked lamps must be used in place of the unlocked lamps. Well, that order has given great dissatisfaction, and I have found it resisted by the men who work in the mine. However, I am very glad to hear from you that you are not dissatisfied with the work, so far as it goes, of the existing inspectors, and I shall convey that sentiment on your part to them."

Indians Near the Colorado Canyon.

Major Powell during his exploration of the Colorado river of the West, gained many very interesting facts concerning the Indian tribes living in that region. He traveled for many months in a country where it is doubtful if white men ever before went and visited the camps and villages of many tribes of Indians. He speaks of camping near the Grand canyon where there were some Indian neighbors. During the inclement weather these aborigines live in shelters made of boughs or bark of the cedar which they strip off in long shreds. In that climate most of the year is dry and warm, and during such time they do not care for shelter. Clearing a small circular space of ground, they bank it around with brush and sand, and wallow in it during the day, and huddle together in a heap at night, men, women and children, buckskin, rags and sand. They wear very little clothing, not needing it in the lovely climate.

Altogether these Indians are more nearly in their primitive condition than any others in the continent with whom Major Powell is acquainted, and no one has had more experience than he has. They have never received anything from the government, are too poor to tempt the trader, and their country is so nearly inaccessible that the white man never visits them. The sunny mountain side is covered with wild fruits, nuts and native grains upon which they subsist. The *ooze*, the fruit of the Yucca, or Spanish bayonet, is rich, and not unlike the paw-paw of the valley of the Ohio. They eat it raw, and also roast it in the ashes. They gather the fruits of a cactus plant which is rich and luscious, and eat them as grapes, or from them express the juice, making the dry pulp into cakes, and saving them for winter; the wine they drink about the camp-fires.

They gather the seeds of many plants, as sunflowers, golden rods and grasses. For this purpose they have large conical baskets, which hold two or more bushels. They put the seeds with a quantity of red-hot coals into a willow tray, and by rapidly and dexterously tossing them, keep the coals aglow and the seeds and tray from burning. As if by magic, so skilled are the crones in this work, they roll the seeds to one side of the tray as they are roasted, and the coals to the other. They then grind the seeds into fine flour, and make it into cakes and mush. For a mill they use a large flat rock, such as is shown in one corner of the accompanying engraving, and another small cylindrical one in their hands. They set prone on the ground, hold the large flat rock between the feet and legs, then fill their caps with seeds, making a hopper to the mill with their dusky legs, and grind by pushing the seeds across the large rock, where it drops into a tray. There is very little game in the country, yet they get a mountain sheep or deer occasionally. They get many rabbits, sometimes shooting them with arrows, and occasionally with nets. In the autumn the grasshoppers afford them food.

Gravel in Placer County.

EDITOR PRESS:—Geo. Lee about three miles south of Pino, three years ago last winter, sunk a shaft on his gronnd and at a depth of 54 feet struck a bed of ancient silver gravel which proved to be gold bearing about four feet thick, and which averaged in shaft from eight to ten cents per pan. About two years ago he commenced a tunnel from side of hill below shaft, first running open cut through granite 150 feet, then tunnel nearly 200 feet through granite and about 300 feet through sedimentary stratum of sand and pebbles mixed. At about 250 feet from entrance gravel comes in over head and gradually and unevenly falls till in neighborhood of shaft, when he finds gravel bed from three to seven feet in depth and resting on the sandy and pebbly stratum before mentioned which underlies all the old river bed.

Mr. Lee washed out about 260 cubic yards from which he cleaned up over $2,600. The bed seems to be extensive with a width of about 60 feet, averaging perhaps about four feet in depth. Mr. Lee has just commenced work again with most flattering prospects of a valuable property. M.

Placer Co., Cal.

INDICATIONS are favorable for plans, specifications and the early completion of a mill at Mono Lake for the working of the low grade ore of Aurora. Certain capitalists are convinced that the scheme will prove fruitful of big results.

Wrought Iron and Steel in Construction.

A little work containing convenient rules, formulæ and tables for the strength of wrought iron shapes used on beams, struts, shafts etc., manufactured by the Pencoyd Iron Works, Philadelphia, has been issued by John Wiley & Sons, N. Y. It will afford information on many points to engineers and builders in iron and steel. As far as possible doubtful points were corroborated by experiments, and especially the article upon "Struts" is based on the result of several hundred carefully conducted experiments at Pencoyd. We extract the following remarks on "Structural Steel:"

The various grades of steel used in structures possess such an extended range of physical properties that it is impossible to present as definite a base of strength, stiffness, etc., as can be given for wrought iron.

The character of the material is largely determined by its combination, in minute proportions, with various substances, the most important of which is carbon.

The grades below .15 per cent carbon are known conventionally as "mild steels," owing to their high ductility and to their possessing but very moderate hardening properties when chilled in water from a red heat.

The mild steel has also superior welding properties, as compared with hard steel, and will

INDIANS NEAR THE COLORADO CANYON.

endure higher heat without injury. As a general rule, the greater the percentage of carbon in the steel the higher will be its tensile strength and the lower its ductility. The following list exhibits the average tensile resistances of steel having given proportions of carbon:

PERCENTAGE OF CARBON.	Tensile Strength in Pounds per Square Inch.		Ductility.
	Ultimate Tenacity.	Elastic Limit.	Ultimate Elongation in 8 ins.
.10	60,000	36,000	26 per cent.
.15	66,000	40,000	24 per cent.
.20	74,000	45,000	22 per cent.
.25	82,000	50,000	20 per cent.
.30	90,000	55,000	18 per cent.
.35	100,000	60,000	16 per cent.
.40	110,000	65,000	14 per cent.

These figures, however, are only approximate, as much depends on the quality of the steel, and also the extent to which it has been worked in the rolling process.

Steel whose carbon ratio does not exceed .10 per cent should be capable of doubling flat without fracture, when chilled in the coldest water from a red heat.

Steel of .12 carbon should endure similar treatment when chilled in water 80 degrees F.

When the carbon percentage is .15 the steel should be capable of bending at least 90 degrees, over a curve whose radius is three or four times the thickness of the specimen operated upon, and after being chilled from a red heat in water of 80 degrees F.

Steel having .35 to .40 per cent carbon will usually harden sufficiently to cut soft iron and maintain an edge.

There is much variation from the aforesaid hardening properties in different qualities of steel, as much depends on the influence of other hardening agents besides carbon.

The modern tendency is to limit the use of steel for structural purposes to the milder grades of the material. For steel in steamships the United States Government specifies as follows: "Steel to have an ultimate tensile strength of not less than 60,000 pounds per square inch, and a ductility of not less than 25 per cent in 8 inches. The test piece to be heated to a cherry-red and chilled in water at a temperature of 82 degrees F. After this it must be capable of bending double flat under the hammer without cracking." It requires about .11 to .12 carbon steel to endure this test.

"Lloyd's" rules require the steel to have an ultimate tenacity of not less than 60,000 or not over 70,000 pounds per square inch, with an elongation of at least 16 per cent in 8 inches. This steel, when heated to redness and chilled in water of 82 degrees F., must bend double without fracture around a curve of which the diameter is not more than three times the thickness of the piece tested. For a cold test without hardening, the material must be capable of doubling flat and bending backward without fracture.

Angles and beams for ship frames may have a tenacity of 74,000 pounds, providing the bending tests are satisfactory, and the welding property is unimpaired. It requires about .12 to .14 carbon steel to meet these specifications.

We present the average results of experiments on the strength and elasticity of "mild" and "hard" steel; also the comparative resistance of these materials in the form of struts. The "mild steel" had an average carbon ratio of .12 per cent, and the "hard steel" an average carbon ratio of .36 per cent. The average strength and elasticity of wrought iron is inserted for the purpose of exhibiting the characteristics of the steel and iron. As in the case of the steel, the several values given for iron are the results of a few special experiments:

MATERIAL.	Tensile Strength in lbs. per Square Inch.		Ductility.	Modulus of Elasticity in lbs.
	Ultimate Tenacity.	Elastic Limit.	Elongat'n in 8 ins.	
Iron	51,000	31,000	16 per ct.	28,400,000
Mild steel	64,000	37,100	23 per ct.	29,300,000
Hard steel	92,000	56,700	18 per ct.	29,280,000

From the same material the following results for compression were obtained:

COMPRESSIVE RESISTANCE.		
MATERIAL.	Elastic Limit in lbs. per Square Inch.	Modulus of Elasticity.
Iron	29,500	27,090,000
Mild steel	37,400	24,760,000
Hard steel	55,700	24,570,000

THE *Appeal* says Marysville is still a shipping point for a large scope of country, as will be seen from the following list of towns: Sierra City, Downieville, Goodyear, Indian Hill, Camptonville, Oak Valley, Brownsville, Strawberry Valley, Scales, La Porte, Gibsouville, St. Louis, Howland Flat, Poker Flat, Forest City, Alleghany, San Juan, Birchville, French Corral and Willow Glen. Thousands of tons of freight are annually sent to these various points. Some of the firms ship as high as 500 or 600 tons per month. The tonnage of shipments must reach as high as 30,000 or 40,000 tons per year.

THE new claims on the Little Walker river are situated some little distance above where the toll road crosses the Little Walker, and where two creeks flow into the river from the westward. An old prospector from Aurora met Joe Kingsley at the old Dog Town diggings in 1859, and urged Joe to examine this same ground, and exhibited some fine specimens, but for some reason it was neglected until recently. There are said to be good placers, and that the ore goes $30 per ton.

Gravel Mining.

It is by no means the case that all the hydraulic mines in California are shut down. We gave an account last week of the operations in Trinity county. But in many other counties the mines are working also. The feeling against hydraulic mining is by no means as great as it was. The people of the State are even now beginning to feel the effects of the stoppage of the big mines. Money is by no means as plenty as it was, and the product of a million of dollars or so a month which we formerly had from this source is missed. The people who hold the agricultural land in the vicinity of the mines see too that they will be better off with a lot of miners to sell their product to, and begin to think that an entire suppression of hydraulic mining will not be as good a thing as was supposed.

In fact, in a number of places the miners have been buying the right to dump their tailings, so as to be able to work their claims. This is mostly in the cases of comparatively small claims of course. The miners seem to think it cheaper to submit to a limited amount of extortion than to go into litigation. They would rather pay liberally to get what they want than to go to law. The agriculturists are benefited by this, of course, for they get a part of the yield of the mines, as well as the crops they sow and reap themselves.

This is rather a curious state of affairs, but it exists in more places than many would suppose. It is of course disappointment to the lawyers, and to the more rabid opponents of the miners. But it is a fact, nevertheless, that this is being done.

Two Lodes in One Application for Patent.

In reversing the decision of the Commissioners of the Land Office in a recent case, the Secretary of the Interior has decided that a lode claim application for patent may embrace two or more lode claims. But this ruling applies only to cases arising before the circular of instructions of June 8, 1883. This ruling (though the reverse of former ones) has become necessary in view of recent judicial interpretations, especially those of the United States Supreme Court. In the case of the Smelting Company *vs* Kemp it was decided:

"The last position of the court below, that the owner of contiguous locations who seek a patent must present a separate application for each, and obtain a separate survey, and prove that upon each the required work has been performed, is as untenable as the rulings already considered. The object in allowing patents is to vest the fee in the miner, and thus encourage the construction of permanent works for the development of the mineral resources of the country. Requiring a separate survey and notice, where several adjoining each other are held by the same individual, would confer no benefit beyond that accruing to the land officers from an increase of their fees. The public would derive no advantage from it, and the owner would be subjected to onerous and often ruinous burdens. * * * It was, therefore, very natural, when patents were allowed, that the practice of presenting a single application with one survey of the lode tract should prevail. It was at the outset, and has ever since been, approved by the Department, and its propriety has never before been questioned. Patents, we are informed, for mining ground of the value of many millions of dollars, have been issued upon consolidated claims, nearly all of which would be invalidated if the propositions assumed by the defendants could be sustained."

CONSOLIDATED LOCAL MINING OFFICERS.—W. S. Bender, Chief Clerk at the Ophir office, in this city, resigned his position last Tuesday, and turned over his books to W. H. Lowell, who took his place as Secretary of the Bonanza firm, vice J. Minor Taylor resigned. Mr. Lowell, assisted by J. A. O'Donoghue, will now transact all the business of the Union Consolidated, Sierra Nevada, Union shaft, Ophir, Mexican, Consolidated Virginia and California mines at the local office of the Consolidated Virginia mine. *Virginia Enterprise.*

A NUMBER of miners have left Newcastle, Great Britain, for China. The system of emigration, it is interesting to note, has been going on among northern miners for the past few years. Not many of the men of Northumberland and Durham have ventured to China, but it is a positive fact that thousands within the past five years have emigrated to the United States, to Canada, New Zealand and other places.

IN June, seven California quicksilver mines yielded 2,694 flasks of quicksilver, of which the New Almaden produced 1,859 flasks.

The Block System of Underground Prospecting.

The plan of development that has been practiced in certain very large and important veins, by opening drifts in or parallel with the course of the ore channels and cross-cutting from the main drifts at intervals of from fifty to one hundred feet, thus dividing of the ground exposed into blocks, is one that results in an apparently methodical and workmanlike system. By following it, the main openings are kept straight, and, when a large body of ore is struck, its extraction is much facilitated by the plan of operations that has been conducted during the prospecting period. Unfortunately, however, there are few mines that can be economically opened and developed in this way. The system appears to be the only one feasible in cases like that of the Comstock lode, where the widtb of the ore bearing ground is very considerable, and the o e occurs in detatched bodies, giving few indications of its presence until the mass itself is struck. A company having large capital and extensive plant often proceeds to develop narrow veins on the same plan, when the more natural and practical method would be to strictly follow the vein on each level, provided good working ground is found on the course of the vein itself, and to keep all workings, such as uprises and winzes, within or as near as possible to the ore region. The objections to this method are, that the workings are crooked, and often extremely tortuous; that the distances, from point to point, are sometimes considerably increased; and that the appearance of the mine, to one who has been accustomed to the system of cross-cutting in blocks, is wanting in the regularity of the latter method. On the whole, however, the chances of finding ore, and at all events of missing as little of it as possible, are much increased by working, so far as practicable, entirely in the ore channel. It should be remembered that the only objects of mining at all are, in the first place, to find, and, in the second, to extract ore. The latter pa t of the work can be easily enough managed after development has proceeded to such an extent as to show reason for changing the system of openings in any way. It certainly seems absurd to proceed to open a mine on the grand scale that would be appropriate in handling enormous bonanzas, when, by adopting the more economical method, a small but certain profit could be assured. The Mexicans, who are miners born, and not by education, and who have the keenest instinct for following indications of ore, limit the size of their prospecting drifts to the smallest possible dimensions, so that often they have the appearance of burrowings rather than of systematic mine openings. It is not necessary to adopt their system in its entirety, nor to carry it to that extreme that results in the making of gopher holes, through which a man has to pass on his hands and knees; and on the other haud, it is perfectly feasible, having once found ore in quantity, to stope it out and raise it by our most approved methods. But there is no doubt that much could be learned in the way of economy and practical success from the primitive and despised, but very efficient, methods of mining of the Mexicans.

In working argentiferous lead deposits in limestone, cross cutting in blocks is a most uncertain means of prospecting; for the stringers and pipes that serve as leaders to the main bodies are easily missed by drifts; and unless the galleries are very numerous and close together, unexplored places are left that might contain profitable ore bodies. At Eureka, Nevada, the two opposite systems have been pursued in the same district. The Eureka Consolidated Company has, as a rule, conducted its prospecting operations on the plan of following ore indications, with little regard to the regularity of its drifts. The Richmond Company, adjoining, has pursued the course of laying off its ground in blocks and cross cutting for ore. These cases, however, show little to decide the question of relative success; for both companies have been very fortunate, and the cross cutting system, owing to the immense size of the ore bodies, has been followed under exceptionally advantageous conditions. Where ore exists in such large masses, it is not a difficult matter to find it, no matter what system he adopted; but it is safe to say that in most lead mining districts blind cross cutting would be neither the safer nor the more economical plan.

A parallel extravagance is sometimes committed in locating shafts at too great a distance in the hanging wall country from the outcrop of the vein's medium dip, the object being to develop the ground at the greatest possible depth by a single shaft. Very often, in cases where the undergrouud features are not well known, the more sensible plan would be to follow the vein down by an incline on the dip. Having once struck a bonanza of size sufficient to warrant it, the siuking of a vertical shaft in the proper place becomes a simple matter, and the cost of pushing shafts and other openings in barren country rock is justified by the developments; but in exploiting claims that can only be classed as prospects, the shortest and most economical means should be pursued. Mining on the grand scale is being steadily supplanted by more practical and less pretentious means.—*Albert Williams, Jr., U. S. Geol. Survey.*

Working Iron Beach Sands.

Mr. Jas. Davis, of the Mossend Steel Works, England, has written the following letter to a number of English technical journals:

For many years past the deposit of iron sand, both on the shores of New Zealand and of Canada, has been the object of much solicitude on the part of the governments of these countries, who have endeavored to use this raw material, which is so rich in metallic iron, and of which there is an almost inexhaustible supply, to a commercial advantage. It was urged that the absence of suitable fuel within reasonable distance of the deposits would always he an insuperable obstacle in the way of using up the sand on the spot; yet that obstacle, serious as it seemed, would appear to be overcome, as coal and slack from Waikato may be obtained that is suitable for gas producing.

Having experimented with these sands, I have been able to obtain good and satisfactory results, both as to its qualities in iron and steel, either by working it into finished merchant bars or converting it into soft steel by the Siemens open-hearth furnace, or by making crucible steel of a high quality. I treated the sands as under: After working the sands in the Siemens rotary furnace, reduced with charcoal or soft coal, the balls were hammered into blooms; these were rolled into good merchant bars suitable for the market. To produce crucible steel, bars were cut up into small pieces, which is usually done, and melted in crucibles, the production of which was a very fine quality of steel. For producing mild steel for plates, etc., in the Siemens open-hearth furnace, the balls were taken from the rotator and hammered or squeezed into blooms, then charged with the exact proportion of pig iron, and gave excellent results; and so far as my experience has gone with treating ores of almost every nation directly, both hy puddling and with the revolving process, I have found nothing so well adapted to treat directly as these sands.

It has been proved by experience that to work ores or magnetic sands directly they must contain a high percentage of metallic iron. This we have in these sands, as the appended analysis shows; and although so much has been expended in these countries in experiments to work up these sands, yet I have not read of any proving successful. To puddls is by far too slow a process, and too expensive. What is required is a process that will be able to meet the dsmands of the country; and as the Siemens furnace has now passed its experimental stage, it can be built so that with one rotator 30 tons of blooms a week can be made.

ANALYSIS OF TITANIC SAND.

Peroxide of iron	67.04	= Iron 70.4
Protoxide of iron	30.17	
Oxide of manganese	.22	
Alumina	.16	
Lime	Trace	
Magnesia	Trace	
Titanic acid	1.64	
Sulphuric acid	Trace	
Phosphoric acid	.03	
Silica	.51	
Moisture	.14	
	99.91	

The principle of this Siemens furnace is well known. It will therefore suffice to say that, with a little improvement in its construction, which practical experience has suggested, it could be made to work for three months or more without undergoing any repair. Moreover, with this process no skilled labor is required; therefore the cost for labor would be very low. This alone is a great advantage, as it is the high price paid for labor in some of our manufactories that prevents us from being able to compete with foreign countries; in fact, with working two or more rotators jointly, blooms could be produced at a cost of 5s. per ton for labor. The Wilson furnace, an American invention, has been successfully tried in New Zealand.

Gold Chlorination in California.

Under the above title, Mr. F. D. Browning, E. M., describes, in the last issue of the *School of Mines Quarterly*, the plant and the method of working at the Providence Mill, Grass Valley, California. The rock is quartz, carrying on an average seven per cent of sulphurets, chiefly pyrites. It goes without sorting to the grizzlies, the coarse stuff being delivered to the rock-breakers. From the bins the ore is fed by Hendy automatic feeders into the batteries of the 40-stamp mill. The stamps drop seven inches, 96 times a minute, their weight being 750 pounds. They crush through a No. 5 punched screen, equivalent to a from 30 to 40-mesh sieve. The free gold is amalgamated in the battery and on silvered copper plates, which are inclined one and three-fourths inches in a foot, this steep pitch being employed to keep the plates clean and yet avoid the use of to much water, which would flood the concentrators. They have the full width of the battery, and are four feet long. Beyond them, are two sluices, each 16 inches wide and 14 feet long, having the same pitch. The pulp is carried through launders to Frue vanners, there being two to each battery, or sixteen in all. The concentrates, which contain as a maximum 10 per cent of sand, are dried and then go to the chlorination-works. They are reported to carry $120 in gold and $12 in silver per ton. The sulphurets are roasted in two-story furnaces, with a third hearth on top of the furnace, the latter acting as drier and pre-heater.

The ore is roasted in two-ton charges, remaining twelve hours in the second hearth and four hours in the bottom hearth. Ths temperature is allowed to go down, and one per cent of salt is added. One man works one furnace in eight-hour shifts. The roasted ore is sieved and is put into tubs holding two and a half tons of ore. For each of these as much chlorine is used as can be produced from eight pounds of black oxide of manganese, 22 pounds of salt and 16 quarts of 66 Baume sulphuric acid. When chlorinated, after two or three days, the gold is washed out with water, and precipitated with sulphate of iron. The silver remaining in the residues, chiefly as a chloride, is extracted with hyposulphite of lime, and is precipitated with calcium polysulphide. It is claimed that 94 per cent of the gold and 60 per cent of the silver is saved.

The mill is run by a six-foot Pelton hurdy-gurdy, driven with 104 inches of water under a 390-foot head, costing 16 cents an inch, so that the power costs $16 64 a day. The batteries, concentrators, and chlorinatiou-works take five inches of water.

Mr. Browning estimates the cost of milling as follows:

COST OF MILLING AT THE PROVIDENCE MILL.

Three men at rock-breakers at $2 25	$6 75
Three men at batteries at $2 25	6 75
One man at concentrators at $2 50	2 50
One foreman	3 50
110 inches water at 16c	17 60
Wear on shoes (steel at 11c. per pound)	6 11
" " dies	3 42
" " screens	3 87
" " rock-breakers, concentrators and copper plates	5 00
Illuminating	1 00
Lubricating	1 00
Total	$57 50

The average quantity of ore milled per month is 1850 tons, or 62 tons per day, which brings the cost of milling and concentrating to about 93 cents a ton.

Mr. Browning puts the immediate daily expense of the chlorination-works, which have a maximum capacity per day with two furnaces of 9 tons, as follows, when running at full capacity:

One foreman	$3 00
One white laborer	2 25
Five Chinamen, at $1 50	7 50
Two cords wood, at $5	10 00
20 pounds binoxide manganese, at 2½c	80
360 " salt at 1c	2 60
216 " sulphuric acid, at 2c	4 32
Lime, Sulphur and calcium hyposulphite	30
Illuminating	20
Extras	1 00
	$31 97

The mill, however, produces only 4½ tons a day; but as the works are kept running, the actual cost is higher, the estimate based upon 4½ tons per day being:

Labor	$12 75
Two cords wood	10 00
Fourteen pounds binoxide of manganese	38
126 pounds salt	1 26
104 pounds sulphuric acid	2 08
Lime, sulphur and calcium hyposulphite	15
Illuminating and extras	70
Total	$27 32
Cost of milling	57 50
Total outlay per day	$84 82

or $1 37 per ton, not including general expenses, interest on and depreciation of plant.

Shipping Ores to Kansas.

The Prescott (Arizona) *Courier* says:—As this portion of Arizona is without general reduction works, owners of rich silver mines have been compelled to ship their ores to Pueblo, Colorado, and Bensou, in Southern Arizona, in order to have them treated in a proper manner. The cost of shipping has been, is yet, a heavy tariff on the richest ores; still we have not heard of a single miner who has shipped at a loss. This fact speaks well for the richness of our ores. F. W. Blake, of the First National Bank, was the first citizen of Prescott to make the shipping ores a regular business. His efforts have, of course, helped our country and its miners. He still attends to the business for his bank and will, we hope, continue to do so.

About the first of next August, Douglass Gray, an assayer and metallurgist, will commence purchasing all kinds of high grade ore for the Boston and Colorado Smelting Company, of Argo, Colorado, and for the Kansas City Smelting and Refining Company, of Argenta, Kansas. He is local agent for these two companies and will have their active assistance in the matter of getting cheap freight rates, etc. These two companies are entirely responsible, as is, also, Mr. Gray. Assaying, sampling, everything will be done on the square, so that prospects are now fair for more active mining and better times in this part of Arizona. Mr. Gray will make liberal advances on all shipments of the value of $100 and upwards.

While the *Courier* would like to see the rich ores of our mines treated at home, it freely admits that, in our present emergency, the best we can do with them is to let Mr. Blake and Mr. Gray ship them to the general smelters.

THE assessment roll of the property of Nevada county has been nearly made up for the current year, and it is found that the decrease in valuation from the previous year will be about $1,400,000.

THE hoisting works of the Delaware Mining Co. on American Flat, Nev., were burnsd last week.

The Tanite Co.

The dull times and blue outlook have not lesseued the activity of this substantial concern. The recent visit to Europe of Mr. T. Dunkin Paret, the President of the Company, completed arrangements, by which its European trade will be doubled during the coming year, and shortly after be quadrupled. In view of this fact, and of the successful business transacted this year (which most manufacturers have found a bad one), the company is now arranging for a large extension of its factory. This factory was started in the year 1867, by the erection of a stone building, 45 feet long and 32 feet wide, two story and attic, with boiler shed extension. The total floor room of the original buildings amounted to 5,550 square feet. Ths flooring nsed at the present time is 34,190 square feet. The new building, for which preparations are now making, will be an extension of, and the same size as the original stone building. It will be a substantial structure of stone, supported by heavy iron arches, which are to span the wheel pit and overflow.

In order to extend and more thoroughly control the water power, and to secure timber and stone for further operations, the company bought during last month from Mr. Robert Huston, his farm of 130 acres, which adjoined the company's original property. The total amount of land now connected with the Tanite factory is about 180 acres, and the Pocono creek flows through it for the distance of about one and three-quarter miles.

On the property recently purchased, the company is now cutting timber for the preliminary work connected with the improvement of its water power. A new breast-work, cribbing and flume are to be erected at the dam, and new fore-hay and penstock at the factory. This latter is to be larger and more substantial than the present one; the heavier, or corner and sill timbers, being 14x16 white oak. At present the factory has, in addition to its steam power, a 42-inch Jonval turbine; but, in the new penstock, a 24-inch Stevenson duplex turbine will be added, and by means of these three motors the various departments can be run independently when desired.

During the last summer the company put in operation a complete fire system. Iron pipes are laid under ground all around the buildings, and are connected with three pumps situated in different buildings, one detatched: one double acting Worthington Steam Pump, one Niagara Steam Pump, and one powerful pump run by water power. Five plug or hose houses stand scattered around at a safe distance from the buildings, containing in all twelve plugs or nozzles, and 650 feet of 1½ inch, and 200 feet of 2 inch hose. Fire-axes are in all these houses, and fire-pails and axes liberally distributed through the buildings. Streams of water have been thrown upon the building in *one minute and forty seconds* after the first signal was given.

On its fields immediately adjoining the factory the Company continues its efforts, still considered experimental, in the culture of Lima beans, and has in, this year, ten thousand five hundred hills, (10,500) all of which promise better than at any past season. It is also raising several kinds of corn new to this country, and intends to sow in the fall all of the new thousand fold rye which it raised last year.

For the benefit of such reade s as may not have seen any previous notice of The Tanite Co., we will say that it manufactures Solid Emery Wheels and the varied machines with which such wheels are applied, and that its goods are shipped to all parts of the world. It has agencies in all the principal cities of the United States, and also in Canada, Australia, and France, besides sub-agencies in many European and other countries.—*Stroudsburg (Pa.) Jeffersonian.*

APEX OF A LODE.—Among the important questions adjudicated in the recent and already noted Nest Egg and Eureka case, Colorado, the following merits special mention: "If all the necessary acts are not done within the time provided hy-law then the mining claim is subject to relocation by any person authorized to locate mining claims; but if such relocation is not made then the acts necessary to constitute a valid location can be performed after the time limited by the statute of the State, and the same will relate back to the original location with like effect as if the same had been performed within the time limited by the statute, providing there has been no intervening claim or location. The apex means that part of the vein or lode found nearest the surface of the earth, and where it ceases to continue in the direction of the surface, and where it is first found in passing on its course downward into the earth. If you (the jury) find there exists within the boundaries of the Nest Egg lode claim, a vein, lode or ledge, the top, outcrop of apex of which is within said boundaries, and which, in its departure from a perpendicular on its downward course, enters into and underneath the boundaries of the Eureka claim, and located as a lode mining claim by plaintiff, then you will determine from the evidence which of these locations is the senior valid location, for the senior location on the dip of a lode is entitled to all such parts of said lode as are included within the side lines of the location as against a junior locator on outcrop, apex and strike of the same."—*Chicago Mining Review.*

ENGINEERING NOTES.

The Panama Canal.

Discouraging reports again come from the Isthmus, in regard to the Panama Canal. The New York *Times* of July 15th, says: "The trouble into which the panama Canal Company is drifting is shown by Commander Richier's reasons for resigning the agency of the company at the Isthmus. He struggled without success to prevent the fearful waste of funds with which the work was carried on; but that which excited his special indignation and caused his abrupt departure from the company's service was the reckless misrepresentations made regarding the progress of excavations. His repeated, pfotests were unheeded and he resigned, and refused to have anything more to do with the company on any terms. It is evident this huge project, blown up and sustained this long by the prestage of Ferdinand De Lesseps, is in danger of collapsing through utter loss of confidence in its management, and its prospects are very likely to prove the monumental failure of the age.

Lieut. Brown, of the U. S. Navy, has made a long and interesting report on the condition of the canal, under date of June 2, 1884. The original estimated cost was $125,000,000, and the time required for its completion was seven years. Nearly half of that time haa already elapsed, and as near as he can find out, not far short of $60,000,000 has been expended exclusive of the $20,000,000 expended for the Panama Railway. It is said that nearly all the material has been purchased at extravagant prices—that much of it is unusable—notably a number of exeavators, which, while anitable for the Suez sand, are unable to excavate the earth and rock of the Isthmus. Lientenant Brown waa informed by any intelligent person that material costing $15,000,000 had been allowed to sink into the marsh and was finally covered up. It is even said that some of the material has already been condemned and sold to vessels leaving Colon for ballast.

Forty-one hospitals have been constructed, costing over $3,000,000, and accommodating only about 400 patients, but their capacity will have to he increased if the work is vigorously prosecuted.

Lieutenant Brown considers the completion of the canal, accordiug to present plans, as very doubtful, as it will certainly require much more time and money than was originally estimated. He thinks that a canal with locks would be more feasable, but that its net profits would be much less.

A GREAT RAILROAD EVENT IN SOUTH AMERICA.—The great event of the past fortnight, says the Buenos Ayrea *Standard* of May 22d, has been the completion of the Andine Railway to Mendoza, capital of the province of that name and lying at the foot of the Andes. The importance of this great event can not be exaggerated; the line crosses the continent stretching from the Parana to the Cordillera. A zone of immense natural wealth is thus thrown open by this quick means of communication, and the traffic on the line promises to be very large. Mendoza is one of the richest provinces of the Republic; it covers an area of about 5,000 square leagues of land at the foot of the Andes, with a population estimated at 150,000 souls. The great drawback of the past—onerous and difficult means of communication—is now removed, and we may look forward to a great development of all the industries of the province. The mineral wealth of the province also is beyond calculation.

THE MERSEY TUNNEL.—The connection between the opposite ends of the railway tunnel under the Mersey, to connect Liverpool with Birkenhead, which was affected January 17th, is the consummation of one of the most important engineering works yet carried out in England. The tunnel under the Severn exceeds the Mersey Tunnel in length; but the latter is at present the longest roadway under a tidal river. The length of the Thames Tunnel is only 1,300 feet, whereas that of the Mersey Tunnel is nearly three times the length, or 3,690. It is expected that railway communication between Liverpool and Birkenhead will be established in about twelve months.

THE BRITISH CHANNEL TUNNEL PROJECT seems to have been at last temporarily abandoned since its defeat in the British house of commons by the decisive vote of 222 to 84. It will evidently be some time before locomotives with trains of cars will dive under the sea from the English coast and reappear on the shorea of France; hut the pertinacity shown in advocating the tunnel scheme may he successful in the end. The grounds of opposition on the part of the British government are regarded by other nations as most puerile.

CONNECTING THE BALTIC AND NORTH SEAS.—It seems that the idea of constructing the long-thought-of-canal which is to connect the Baltic and the North Sea has at length assumed definite shape. Bismarck has recousidered his former objections, and a hill for powers necessary to execnte the works will be laid before the Reichstag during the coming session. The cost of making the cntting through Holstein is estimated at between $30,000,000 and $35,000,000.

USEFUL INFORMATION.

Hand and Machine Made Putty.

How the two kinds are made, and the difference between them, is related by an old painter to the ubiquitous reporter as follows :

The best is made of raw linseed oil and whiting, the latter being simply chalk ground in a mill like flour. It comes out with a fine flint grit in it. Before making putty of it, a few old fashioned men, who believe in making the best of everything, wash the grit out. The fine flour is then dried. If it is not dried perfectly it takes up more oil than is desirable or profitable. From 500 to 600 pounds about 15 per cent, by weight, of raw oil to 85 per cent of whiting are put in a chaser and thoroughly mixed. The chaser is an annular trough, ten feet in diameter. From a vertical shaft in the center two arms extend, on the ends of which are heavy iron wheels that rest in the trough. When the shaft revolves the wheels chase each other around the trough. When mixed, it is packed in bladders for convenience in handling. The adulteration of putty is effected by mixing marble dust with whiting. It costs about a quarter of a cent a pound, and whiting costs twice that. Paraffine oils, at from 20 to 30 cents a gallon, are used instead of linseed oil at 60 cents. The marble dust makes the putty gritty, and the cheap oil makes it sticky. Cheap putty is decidedly cheap. Putty in bulk, wholesale, is worth $2 12 a hundred pounds. The other window glass cements run from $1 40 to $1 75. They are dear at that. They take longer to put on and longer to dry. Putty is neither imported nor exported. A lot was brought over a long time ago, but that was when oil was very high. The whitiug comes from England.

A superior article of putty is made, however, by the further addition of white lead in oil, japan varnish and a small quantity of turpeutine, which makea a hard cement that does not shrink, aud when dry can be rubbed down with pumice stone or dusted with sand paper, so smoothly will it cut. Even in the common sorts of putty it is well to use some white lead if a hard putty is desired.

Measuring Standing Grain.

An officer in the English navy has constructed a table for estimating, with all needful accuracy, the amount of wheat on an acre of land before it is harvested. The estimate can be made as soon as the grain is ripe. Make a wood or iron frame one yard square, carefully let it down over the standing grain, and then shell and weigh all the grain on the straws helonging inside the frame. If a circular "crop form," as he calls it, is more convenient, make it 6 feet 9¾ inches in diameter, of half-inch iron. From his elahorate table we extract the following:

2 oz. per sqr. yard equals 10.08 bu. per acre.
2½ oz. per sqr. yard equals 12.60 bu. per acre.
2⅔ oz. per sqr. yard equals 13.86 bu. per acre.
3 oz. per sqr. yard equals 15.12 bu. per acre.
3⅓ oz. per sqr. yard equals 17.65 bu. per acre.
4 oz. per sqr. yard equals 20.17 bu. per acre.
5 oz. per sqr. yard equals 25.21 bu. per acre.
5½ oz. per sqr. yard equals 29.00 bu. per acre.
6 oz. per sqr. yard equals 30.25 bu. per acre.
7 oz. per sqr. yard equals 35.29 bu. per acre.
8 oz. per sqr. yard equals 40.33 bu. per acre.

These estimates are on the basis of 60 pounds per bushel. The 2½ ounces to the square yard is about the average yield of wheat per acre in America; the 5½ ounces per sqnare yard is the average in Great Britain.

HOW ANNEALING MAKES METALS, ETC., PLIANT.—The anncaling of wire, glass and other substances renders them soft, more ductile and less brittle. A substance is annealed by simply heating it and allowing it to cool gradually. Recent experiments have resulted in the conclusion that the heating results in a kind of rupturing or cracking open; and in seeking an explanation of this, it is thought that in bringing the substance—take wire for illustration—suddenly to a white heat, the air held both physically and mechanically in the wire, is expanded and exploded, tearing its way out and leaving fissures and cracks all over the surface. These fissures are plainly visible and assume the torn and ragged appearance that might come from such explosions of the contained air. The wire, before stiff, is now soft and yielding, simply because it is cracked, and bends readily at every break on its surface. To illustrate this, we have only to paint a sheet of paper with a gum-like dextrine, or even mucilage; when the paper is stiffened, draw it over a sharp edge and crack the gum, and the paper will bend freely in every direction. Here the cracks are visible and it is easy to see that they allow the gum to bend. It may from this, be seen that annealing is a rupturing or cracking of the substance, and that its softness and pliability result from the free play given by the cracks.—*Manufacturer and Builder.*

VERTICAL FLIGHT OF BULLETS.—Experiments have been made in Hartford, Conn., with the vertical firing Gatling gun, in the presence of a number of mechanics, military men and others interested in gunnery. The inclination of the piece was determined hy a combined spirit level and quadrant. At an inclination of fifteen degrees, the time between the discharge and the return of the hullets into the river on the hanks of which the experiments were made, was fifty-nine seconds. On an exact vertical fire, the time of return was fifty-four seconds. The force of the return of the bullets—44 caliber rifle was sufficient to drive them through four inches of pine boards; enough to render any defenses not bomb proof untenable against such a shower.

AN ORIGINAL RAT TRAP.—An Illinois correspondent has been successful in catching rats with a trap of his own contrivance. This trap cosists of a sheet iron pipe with a sort of rim on both ends and a strong two-bushel sack tied firmly around one end. Every hole is stopped in the corn-crib but one, which opens into a feed box on the other side of the partition. Then the pipe is placed in the feed-box and fitted, the open end firmly over the hole, allowing the sack to hang over the edge of the box into the manger. The trap prepared, the door of the crib is left open and the rats permitted to have their own way for an hour or so. Then the door is shut and a noise made to frighten the rats. Having but one means of escape they rush into the pipe and down into the sack. This correspondent caught twenty-seven rats the first time he tried his trap.

ANCIENT SYSTEM OF WEIGHTS.—The most ancient system of weights in the Kingdom of England was the moneyer's pound, or the money pound of the Anglo-Saxons, which was continued in use for some centuries after the Conquest, being then known as the "Tower pound," or sometimes as the goldsmith's pound. It contained 12 ounces of 450 grains each, or 5,400 grains, and this weight of silver was a pound sterling. The Tower pound was abolished in 1527 by a statute of Henry VIII, which first established Troy weight as the only legal weight for gold and silver, and from that time to the present our system of coinage has been based on the Troy weight, the Troy pound containing 5,760 grains.

VEHICLES A HUNDRED YEARS AGO.—A lecturer on "London One Hundred Years Ago," says: "The four-wheeled vehicle, the aristocratic equipages, the hansom and the large, commodious 'bus of to-day were not then to be seen. In their place the wealthy rode or were conveyed on their trips or visits of pleasure to the theatre, the club, the gardens, the balls and routs of those days in the sedan chair, as is now the practice in China and other oriental countries. On each side of the sedan, borne by two stont men, ran the link-boys with lighted torches, flashing a glare of light as they ran on either sides of the narrow streets of London."

WATER-PROOF SHOES.—Boots and shoes may be rendered water proof by soaking them for several hours in thick, soapy water. The explanation is that the compound forms a fatty acid within the leather which then acquires the property of resisting the penetration of moisture.

GOOD HEALTH.

Indigestion.

Indigestion is the source of a multitude of diseases. In fact, disease necessarily follows long continued derangement of the digestive organs. The stomach is the laboratory in which the most wonderful chemical proccsses are constantly going on. Whatever is taken into the stomach is at once acted upon chemically, and the wholesome and nutritious portions go to build up and strengthen the system, while the effete matters are expelled through the various channels. Now when the food is crude and indigestible, or when good food is not properly masticated and mingled with the saliva before it enters the stomach, it lacks a very important element, and the digesting organs are subjected to great fatigue in efforts to prepare it for its work of sustaining life. When we consider the difficulties with which the stomach has to contend; of improper food forced into the stomach in a crude state and frequently in excess of the requirements of the body; of liquor drinking and tobacco using; the fact that three adult persons out of every four are of unsound health, and that the average term of human life is less than half what it should be under correct methods of living, should surprise no one.

There is not one person in ten who thinks of or seems to care for his health until he loses it.

The most absurd excuse for neglect of duty to oneself is, that he cannot always be looking after his health. In other words, he has not the moral power to abstain from excesscs that weaken the body and shorten life, as surely as night follows the day.

What a man eats and drinks habitually has much to do with the condition of mind and body.

The stomach is the fountain-head from whence the body draws its supplies. The old Roman idea of manliness was a "sound mind in a sound body." It is encouraging to know that the more intelligent of the present generation are adopting this view; and it is this class that is now paying the most attention to the laws of health. All colleges encourage today what they condemned twenty years ago; aa boat racing, hall playing, and regular systems of exercise. If an engineer were to load the safety-valve and build a fire under a steam boiler, and keep the fire replenished for a time without starting the engine, he would produce an explosion. If a man eats heartily, and leads an indolent life, a similar trouble occurs: his body is filled with the products of digestion; fat and fluids accumulate, and the muscles become soft and weak; more blood is made than the system requires, and the excess becomes a dangerous obstruction in the current of life, and the explosion may come in the form of apoplexy. The remedy is, to adapt the quality and the quantity of the food to the daily requirments of the body. Remember that labor, or active and sufficient exercise every day, is imperatively demanded if we expect to keep well. Let the food be plain but nutritious, and avoid rich pastry and other indigestible foods. Adjust the food supply to the bodily activities. —*Journal of Health.*

Hope as a Remedy Against Disease.

But little touched upon, hope as a remedy against disease is, if wisely and judiciously employed, one of the most valuable and useful means that the physician can employ. Call it what we may, and reason about it as we please, no man of experience will for an instant question that imagination, the prejudices, the mental condition, the conviction of the patient, in many cases, exerts a most powerful and most real influence upon the progress and termination of diseased conditions. Has it not happened to every one of our readers (it repeatedly has to us) to discover accidentally, so to speak, a condition of chronic disease, which has evidently been present for years, and yet the patient has maintained fairly good health, and is, at the time of the discovery, in no immediate apparent danger; yet when told that he is afflicted with an incurable disease that may carry him off in a few days, or that he may live for months, immediately wilts, like the sensitive plants when touched, and dies in a day or two?

Again, do we not all know of cases of chronic disease in persons with a happy, hopeful, contented disposition, disease that we felt sure would soon prove fatal? And yet we see them go on day after day and year aftey year enjoying apparently good health. Of course we are familiar with and thoroughly recognize the fact that worry, that mental anxiety, is diametrically opposed to good health and long life; and in this fact we recognize the explanation of the influence of depressing opinions and advice: for if we tell a man with a nervous temperament that he *may* die in a few days, from that moment all peace and contentment vanishes from his life, while anxiety, worry and unrest take possession of his whole being.

The practical point to be deduced from these reflections is, that it will redound not only to your patient's advantage, but also to your own professional reputation, to make it a rule always to take the most hopeful view that is possible of the patient's condition, especially when the man or woman is one the "nervous, worrying kind," and always to remember that "hope kept alive" is the great secret of success among quacks. Let us steal their thunder.—*Med. and Surg. Reporter.*

THE GROWTH OF HUMAN BEINGS.—The investigations of the Anthropometric Committee of the British Association, have made more or less clear, several interesting facts respecting the rate of growth of the two sexes. The period of most rapid growth is from birth to five years of age, and then both sexes grow alike, the girls being a little shorter and lighter than the boys. From five to ten the boys grow a little faster than the girls, but from ten to fifteen years the girls grow the faster, and at between eleven and a-half and fourteen and a half years old, are actually taller, and from twelve and a-half to fifteen and a-half are heavier than the boys. The boys, however, take the lead between fifteen and twenty years, and grow at first rapidly, but afterwards slower, and complete their growth at about twenty-three years, while girls grow very slowly after fifteen years of age, and attain their full stature at about the twentieth year. The tracings and tables show a slow but steady increase of stature up to the fiftieth year, and a more rapid increase in weight up to the sixtieth year in men, but the statistics of women are too few after the age of twenty three to determine the stature and weight of their sex at the more advanced periods of life. The fact that man continues to grow in stature up to his fiftieth year contradicts the popular notions on the subject according to which he ceases to grow before reaching half that age.

HOW TO KEEP THIN.—I found that the quantity or quality of what I ate made but little weight change, but on restricting the quantity I drank, the difference was soon apparent. I lost thirteen pounds in a fortnight, and was all the stronger and better for the loss. I took one cup of coffee for breakfast, half a pint of ale for dinner, and one cup of tea with that meal. In other respects, as to food and exercise, I lived as I had been accustomed to. I may add that I was not obese, nor did I imbibe immoderately, but wished to try the experiment for scientific purposes. — *Letter in London Standard.*

BORAX FOR HOARSENESS.—M. Corsón, in the *Journal de Pharmacie*, says that a piece of borax weighing two or three grains will, if allowed to dissolve slowly in the mouth of a singer, remove all trace of hoarseness.

MINING SUMMARY.

The following is mostly condensed from journals published in the interior, in proximity to the mines mentioned.

CALIFORNIA.

Amador.

SHUT DOWN.—Amador *Ledger*, July 19: The Zeile mill was brought to a standstill on Tuesday morning, in order to enable some repairs to be made to the chutes. It is expected to get in running order again by the end of the week. At the Grover men are hard at work repairing the damage done by the setting of the machinery. The third crew of contractors commenced sinking operations at the Mahoney last week; the second force having been compelled to surrender the job. About 20 feet has been sunk by the two lots of contractors, for which of course they get no pay. The rock is excessively hard, and even at the advanced rate under the second contract, the men were unable to make anything like wages. It is thought the work under the existing contract will proceed without any more delays. We learn that it is the intention of the Volcano Gold Gravel Mining Company to erect a large derrick at its mine to be operated on a Knight wheel. The company intended by this means to raise the gravel from below up to the level of the flume. A clean-up at the Motson mill, running on rock from the Lighthouse mine owned by W. E. Stewart and others, was made over a week ago, and realized between $5 and $6 per ton—a paying yield, as the ore can be easily mined.

SUTTER CREEK.—At the Lincoln everything remains at a standstill, awaiting the action of the Court in the pending suit. The Amador Consolidated mine looks rather discouraging, and has been so for some time. D. T. Davies and J. A. Steinberger arrived here last night, and it is probable their advent means some change in the situation. The ore-body that has supplied the mill of late is almost exhausted, and the mill will no doubt be stopped shortly. There is said to be rock in the old shaft, and hopes are entertained that the next move will be in that direction.

El Dorado.

GOOD QUARTZ.—*Mountain Democrat*, July 19: Superintendent H. H. McClellan, of the Melton mine, Grizzly Flat, showed us a sample of the ore now being taken out of tunnel number two. This rock will go $30 or $40 to the ton, and McClellan says there is plenty of it, though he does not pretend this is an average of all the ore he finds. The mine was never in better condition than at present, and indications are that the company will soon reap the reward they so richly deserve.

Inyo.

DEEP SPRINGS.—Inyo *Independent*, July 19: Teams are now hauling ore from Deep Springs to the Elna furnace. Mr. Minear, the Superintendent of the furnace, has hurried work as much as possible and is ready for a start. The ore now being delivered at the furnace belongs to S. P. Roberts, of Deep Springs. Quantities of ore from the same mine have been shipped to Oakland and sold there. Mr. Roberts was paid for some of it at the rate of 110 ounces silver and 60 per cent lead per ton. The lowest he was paid for any ore shipped by him from his claims at Deep Springs was 55 ounces silver and 50 per cent lead per ton. If the furnace at Elna shall prove successful in working these ores—and then is no known reason why it should not—the Deep Springs and old Pine Mountain districts can supply unlimited quantities. The railroad now gives facilities for carrying the ores to the furnace that materially lessens cost, and will thereby promote greater mining activity in that region than was ever before known.

BEVERIDGE MINES.—The mill at Beveridge, that has been stopped for some weeks, will be started up again about the beginning of August. The Keynote claim is that from which ore will be taken. The poorest ore ever taken from this claim yielded $58 per ton; much of it went over $200 per ton. The claim is owned by Lasky and Morena. Lately a small vein was opened in the mine, the ore from which is worth $2 per pound. The same parties have found a vein in the Vivarea claim that is fifteen inches wide, and contains over $200 per ton. Twenty-one tons of this ore are now on the dump, ready for milling.

BROWN MONSTER.—Messrs. Walter James and E. J. Reynolds have leased the Brown Monster mine from Mr. Eibeshutz. They will at once proceed to open up new ground in the mine, and expect soon to resume shipments of the rich lead ores that the mine produces. During the past twelve months the Brown Monster has produced some very rich smelting ores.

Mono.

BODIE CON.—Bodie *Free Press*, July 14: There was crushed during the past week 402 tons of ore. The pulp assay was $12.48, and of the failing $1.56 per ton. In the mine the south drift from upraise No. 3, 300-foot level, is in 38 feet.

BODIE TUNNEL.—Advance on the north drift, 200-foot level, twenty feet during past week.

THE NEW STANDARD MINE.—Bodie *Free Press*, July 16: The new Standard mine, situated on Bodie Hill west of the Standard Con., has attracted considerable attention in the six months past and will soon come to the front as a reliable property. There are several hundred tons of pay ore on the dump and prospecting has been pushed to the extent of 400 feet of drifts and tunnels. Louis Lewis, one of the owners, state that they are negotiating for a mill. Official letter of Monday states that during the week the south drift from the east crosscut on the Mono vein, 600-foot level, has been extended 22 feet, making the total length 132 feet. The north drift from same is in fifteen feet. The average assay from the vein in these drifts is $9.62. There are eleven men employed.

DRUM LUMMON BULLION.—Helena *Independent*: The Merchant's National Bank yesterday received nine large bars of bullion from the Drum Lummon mine valued at $21,000. The bars were the result of a ten days' run from the ten-stamp mill, the twenty-stamp mill having been closed down for ten days past, while being changed from dry to wet crushing. We understand the thirty stamps will be pounding away to-day. The above yield shows the ore that is now being worked to be very rich. The maximum crushing capacity of each stamp, as we understand it, is one and one-half tons in twenty-four hours—fifteen tons per day for all ten stamps, or 150 tons for the ten days' run, of which the above is the result. This demonstrates a value of $140 per ton saved in the mill, which, it is needless to say, is immense. The frame work and masonry for the new thirty stamps is about completed, and the stamps and other necessary machinery are upon the grounds, and it is expected will be running in four or five weeks, when the yield of gold and silver will pour in it a steady stream from this great mine—one of the richest and best in the world to-day.

CLIFTON.—Homer Mining *Index*, July 19: The winze from the tunnel in the Clifton mine is still in fine ore, with every indication that the fissure will continue to widen with depth, it being now fully six feet in width. As the ore of this mine is of the freest quality, easily reduced, and averages about $42.50 in gold to the ton, the width attained by the vein at a vertical dept of only about 60 feet renders it one of the most promising properties in the district—all the more so as it is more easily accessible and can be more economically worked than almost any other mine here. The Great Sierra tunnel in Tioga has not cut *into* the Sheepherder lode proper, but has passed through many quartz stringers, feeders to or outflows from the vein, some of these being several inches in thickness and carrying fine looking ore. When work was suspended the tunnel was in 1,784 feet—within just *one foot* of the vein, according to Carpenter's survey, and all the indications are that the header is within the eastern wall of the fissure. Work will not be resumed in the tunnel for some little time yet. August Cordes, the indefatigable prospector of Tioga, has resumed work on his New Brunswick claim on Mount Gibbs. He has, single-handed and alone, sunk a shaft to a depth of 35 feet, and as a reward for his industry has an ore vein over four feet in thickness (and how much more he does not know, as that is the diameter of his shaft) assaying from $13.50 to $181 per ton in silver, and $2.50 to $4 in gold. He will now explore the vein more fully by crosscuts from the bottom of the shaft. The prospects of Patterson District (Sweetwater in this county) are brightening. The Summers Con. is again shipping bullion, and has struck some very rich ore in a winze 100 feet below the 400-foot level. Sheriff C. F. McKinney has let a contract for a 100-foot tunnel to tap the same lode in his Homestake claim adjoining. The Silverado Company's mill will be ready to start up about the first of August. The Gorilla mine is improving steadily in quality of ore, especially on the lower levels. The reduction works and Planet mill were shut down for a few hours during the week, owing to an accident to the main water wheel, but both are now running and working admirably. The shipments of bullion are regular and increasing in quantity. A pack trail has been built up to the mines at the head of Callihan Creek, and work resumed on the Olsen claim, the recent rich discovery which bears such a striking resemblance to the old Standard mine of Bodie. The vein is now over four feet wide in the header of the tunnel, all good ore. William Irwin, for several years Superintendent of the Standard Con. in Bodie, has seven men at work in the Polita mine, near Bishop creek, and intends putting on another gang in a short time. He has from 600 to 800 tons of ore on the dump, which will be worked in the mill at Hawley. Everything about the May Lundy is running smoothly—mine, tramway, teams and mill—and the bullion shipments are regular and of about the same value as last season. Work is progressing as usual in the Bryant mine, and the breasts continue in high grade ore, of which from five to six tons per day is reduced in the Butterfield mill. The bullion shipments from this mine are now regular and large, considering the capacity of the mill. The Virginia Creek Hydraulic Company is using about 500 inches of water through a giant, and is running a heavy ground-sluice besides. The shipments of gold by this company are not reported, but are known to be heavy. The Mono mine in Bodie now employs but eleven men, thirty-five having been discharged during the week.

CONCENTRATOR FOR TEN MILE.—Professor J. G. Murphy, who returned a few days ago from New York, succeeded while East in perfecting arrangements for putting up concentrating works in the Ten Mile district. Professor Murphy has associated with himself Messrs. A. D. Churchill and Chas. G. Buchanan, of New York, and the firm name will be Murphy, Churchill & Buchanan. The works to be erected will be of fifty tons daily capacity to begin with. The machinery is now being constructed at the Union Foundry, Rockaway, New Jersey, and will be of the best in use. It will consist of high speed rolls, one set of 30-inch and one of 24-inch, for fine crushing, the Buchanan patent crusher; revolving screens for sizing; and Golden Gate concentrators, with power for a capacity of 100 tons daily, when it shall be found advisable to increase, the works to that capacity. The location of the concentrator will be at the mouth of Beaver creek where it empties into Ten Mile, opposite the Lee Mountain mines. The company will operate the Lee Mountain and the Latham groups of mines, and outside of the product of these will do custom work. They expect, we believe, to ultimately add smelters to their works. This will be the first move made toward providing the Ten Mile district with local works for the treatment of its ores, and with the encouragement which the miners up in that section will thus receive it will not be long until the Ten Mile mines begin to show up their richness.

Plumas.

GREEN MOUNTAIN.—Greenville *Bulletin*, July 16: On Tuesday morning the Green Mountain Co. started the last 30 stamps, and the whole mine is now running smoothly and well. No. 2 raise has connected with No. 2 blind drift east, and stopes are started above No. 2 drift. The face of No. 2 is very hard, and the company have been running burleigh drills since the 19th ult. The drift is now in about 110 ft and will be continued as rapidly as possible until the east line of chute is reached, a distance of about 90 ft. No. 6 drift east from No. 1 raise is now in 80 ft, and the ground is favorable for good progress, and shows a fine face of good pay quartz. A raise will soon be started to connect with winze sunk from No. 5 tunnel, which will give a large quantity of good ore and facilitate handling of timbers for this part of the workings. Tracks are being laid on the blind drifts and chutes being put in and stopes opened. The company will soon be in shape to handle the ore broken, economically and quickly. As work progresses at the Whiting mine, in French ravine, the quality of the rock improves, we are informed. Ten tons of ore from the Hallstead mine were crushed in an arastra, yielding $30 per ton. The second ten tons yielded $60 per ton. Work on the mill, to be erected at the Lucky S mine, will begin immediately. Messrs. Hardgrave, Hosselkus and Thompson have made arrangements whereby the work will be prosecuted vigorously. Col. Raymond, who has been here for several weeks past, will start to San Francisco to-morrow. He is a mining man of considerable experience, and he has been looking at several of the mines here. He has a very favorable opinion of this part of the country, and thinks it one of the best mining sections in the State. He expects to return in a couple of months.

THE HALLSTED.—Plumas *National*, July 16: Kingsbury's Ferry located the large hydraulic claims which Mr. A. D. Hallsted had been working for several years, and a glance over the ground shows that although much gravel has been removed, only a start has been made, and a mountain of "pay-grit" yet remains to be worked. The water for this claim is bought from Mill Creek, and piped across the East Branch, the large iron pipe being about twenty-four hundred feet in length. The Hallsted quartz mine is on Rich Gulch, and nearly four miles from the Ferry. One run of several tons recently made, yielded $35 per ton, and another run panned out over $60 to the ton. Of course the rock is carefully selected, as it would be slow business to work low grade ore in the primitive style in which they are obliged to work at present. The ore is brought from the top of the mountains, nearly a mile away, with a train of five jackasses. The tunnel is 300 feet in length, and taps the ledge at a depth of 250 feet. At the point of intersection the vein is hard, but the drift to the east soon shows it better, and the improvement is marked every foot of the way for 130 feet, the last 40 feet showing a magnificent chimney, at least 16 feet wide between the walls, all fine looking ore. Parallel with the hanging wall is a vein of three or four feet in width, filled with iron cubes, and decomposed, which prospects splendidly. Taken out by itself this rock should pay $15 or $20 per ton. The vein shows gold in good prospects clear across and should pay an average of $7 or $8 for the entire width. The face of the drifts shows fully as well or better than any part of it, and the body of quartz exposed is simply enormous. The west drift from the tunnel does not look so favorably, being in a hard, blue quartz, filled with bright sulphurets. After taking a look through these tunnels we climb to the upper works, where the rock for the arasta is being mined at present. Here are several openings, all showing the ledge strong, and all showing by prospects that the ore carries plenty of gold for good milling rock. It is nearly certain that this quartz mine furnished the gold that made Rich Gulch famous in olden times, as the work shows that the pay stopped as soon as the ledge was crossed. Taken all in all it is a grand outlook, and with the necessary capital would make the "big mine" of Northern California. It is splendidly located, can be opened by tunnels at a depth of 12,000 feet, is large enough to furnish rock for any quantity of stamps, has good timber in endless quantity, and water can be brought to furnish all the power which will ever be needed.

Sierra.

JEROME YORK'S BONANZA.—Sierra *Tribune*, July 19: Jerome York made another clean-up at his mine in Slug Canyon Tuesday which resulted in giving him the very handsome sum of $750 from eight weeks run with the arastra. For three weeks of that time, owing to the scarcity of water, the arastra did not crush to exceed one ton of ore per day. During the last run, as heretofore, Jerome has only employed one man. Where he is now working the vein varies from one to nine feet in width and everything taken out from between the walls is crushed. Quite recently ran into the hill 140 ft perpendicularly below the present workings and encountered the ledge. At the new point it measures four and a half feet in width and prospects equally as well, if not better than above.

W. H. WELDON'S MINING ENTERPRISE.—At the Gold King quartz mine below Alleghany two shifts of men are engaged in driving ahead the new tunnel, which is now in 100 feet. The rock is very hard and consequently slow progress is made. Mr. Weldon is now arranging to put in a drill manufactured by the California Rock Drill Company, of San Francisco. The new drill will be worked by water power and it is calculated that with its use the tunnel can be run at a very great saving of time and money over the ordinary hand method. The drill referred to has been successfully operated with in other mining sections, but this will be the first one to have been tried in this county. Many mine owners hereabouts will watch the trial of the new drill with interest.

MARGUERITE.—The *Tribune* reporter found every-thing astir at the Marguerite mine. Four hundred feet west of the present shaft they are engaged in grading a site for the new hoisting works. A three-compartment shaft is also being sunk at this point. In addition to sinking from the surface the work is being hurried up by raising from the third and second levels. It is expected to make the connections in about ten days. As soon as the new shaft is completed the hoisting machinery will be removed there and the old works abandoned. The new pumps work well and the work of opening out the level is going rapidly ahead. The outlook of this mine was never more favorable than it is at the present time.

A GOOD SHOWING.—Last week a *Tribune* reporter visited the Hope quartz mine at Minnesota and was pleased in finding a very flattering state of affairs there. G. V. Williams has charge of the mine and under his experienced management the work of development is going steadily forward. In addition to other work a winze has been sunk 37 feet in the face of the main tunnel and a drift run ten feet east and one sixteen feet west. Splendid prospects have been obtained in that quarter. Sufficient gold has been taken from the ledge during the past month to pay all working expenses.

THE ALASKA MINE.—At the Alaska mine, Pike City, Superintendent Davis is pushing work along rapidly. Two new boilers have been placed in the hoisting works. A new Hooker pump, with a pumping capacity of one million gallons of water in 24 hours, arrived at the mine last Sunday and will be planted at No. 3 station immediately. With the new machinery, there is no liability of any further difficulty in handling the water. It is expected to start the mill up early next month.

NEARING THE LEDGE.—The Rainbow tunnel is now in over 1500 feet further. Last week stringers of quartz were encountered and also soft rock, rendering it necessary to timber the tunnel. The course of the tunnel was recently altered and is now bearing more to the east. Around Alleghany there is a very hopeful feeling regarding the future of the Rainbow mine, and the people anticipate lively times for that camp when the lower workings of the mine are properly developed.

San Bernardino.

KING MINE MILL IMPROVEMENTS.—Calico *Print*, July 19: The King Mining Co. are making long needed improvements at the Oriental Mill. As soon as poles can be shipped from Flagstaff a telephone will be built from the mill to the mine at Calico and possibly from the mill to Daggett. The improvements at the mill will be the laying of a pipe from the station to the mill for the transporting of the oil used by the furnace and the erection of a new engine for the purpose of running turning-lathes and other implements necessary for repairing mill and other kinds of machinery. When these improvements are finished the Oriental will be the best equipped mill in the country.

San Diego.

PINACATE DISTRICT.—Colton *Semi-Tropic*, July 16: Arrangements are now all completed to start up the San Jacinto Company's mill now to work on custom ore, of which there is in the near neighborhood 200 tons ready to be crushed. The hauling of ore to the mill will commence early next week. A number of experienced workmen having been sent for to assist in operating the mill. Hon. John Lawshe, the principal owner of the San Jacinto mine, will soon have a large force at work taking out ore from the mine, and there is unusual activity among the owners of other mines in getting out ore to be crushed at the mill. During the week a sale of the Santa Fe mine, in Gavalan district, was effected. The purchasers of the Santa Fe mine are Eastern men of large capital and are well pleased with their bargain, and will immediately proceed to erect a large mill and work the mine for all it is worth. The Santa Fe mine has been worked for a long time by Mexicans, who crushed the ore taken out with splendid results. In the Menifree district we learn that the plant for a large 40-stamp quartz mill has been ordered and, that the Menifree Mining Company are making extensive preparations to develop up their mines. For the present the Menifree ore will be crushed at the San Jacinto mill. We hear that negotiations are now going on for the transfer of valuable mining interests in the districts named.

Tuolumne.

HUNTER.—*Union Democrat*, July 19: The Hunter mine, situated near the Buchanan mine, which was bought by an Eastern company some two or three years ago was sold at Sheriff's sale in January on labor liens to Josiah Phillips and others, lienholders. The time of redemption expiring they received a deed for the property Monday. Phillips has worked the mine the past four months with good success. He represents to be now working the mine and running a ten stamp mill, crushing about thirteen tons of ore daily. In the mine there is a vein two and a half feet in width and for a distance of fifty feet, far as tested, pays from $18 to $20 per ton. From this it looks very much as if the Eastern Company let go its hold too soon from a very valuable property.

NEVADA.

Washoe District.

MEXICAN.—Virginia *Enterprise*, July 16: The winze on the 3200 level, which is being sunk jointly with the Ophir, Sierra and Nevada and Union Consolidated companies, is now making fair progress. Heretofore the rock has not blasted well. It was a kind of bastard quartz, which had to be almost burned out with powder, so little could be thrown out by the blasts. Now, however, some porphyry is coming in, and the rock as a whole breaks out much better. During the past week the winze has been sunk and timbered about 8 feet. There is no trouble on account of water.

UNION CONSOLIDATED.—The only work being done at present is jointly with the Ophir, Sierra Nevada and Mexican, on the 3200 level of that company, in the winze which is designed to explore the north end of the Comstock to the depth of 3300 feet or more. Work in this winze is progressing steadily.

CHOLLAR.—The bulkhead on the 2600 level has been completed, and the valve of the same was closed last Sunday afternoon. The main south drift on this level is being advanced at the rate of about 50 feet per week. The formation is vein porphyry, with some thin streaks of clay and occasional stringers of quartz. From this drift crosscuts will presently be run at proper intervals. The pumps, and all the machinery at the Combination shaft, are running well and smoothly.

GOULD AND CURRY.—The joint Best and Belcher drift southwest on the 2500 level is making good progress in a mixture of soft porphyry and clay, with streaks of quartz of a favorable appearance. A station will be soon opened at the 825 level in the Bonner shaft, and a drift run to the northward, which drift will eventually be connected with the joint west drift of the Best and Belcher and Consolidated Virginia by means of an upraise.

BEST AND BELCHER.—Good headway is making in the joint Gould and Curry southwest drift on the 2500 level. It is in ground of a favorable appearance, being vein porphyry with streaks of clay and stringers of quartz. The joint Consolidated Virginia west drift, on the 1200 level, is being advanced at the rate of 25 feet per week, in a favorable formation of vein porphyry, clay and quartz.

ALTA.—The diamond drill is being run west from the face of the west drift on the 2150 level, and is out some 500 feet. It shows no water in that direction to interfere with drifting. Work has not yet been resumed in the east drift on the 2150 level. There is known to be a considerable quantity of water in that direction, which must be drained off in running exploring drifts into the east ground.

OPHIR.—The new west drift on the 500 level is out about 20 feet. It is in ground that blasts very well. Some ore is still being obtained on the 250 level by taking out and assorting the filling of the old drifts.

HALE AND NORCROSS.—From the 200 level there are being extracted between 400 and 500 tons of ore per week, all of which is brought out through the I street tunnel. Work has not yet been resumed on the 2800 level, at which point there is known to be a considerable amount of good ore.

YELLOW JACKET.—The old upper levels are still yielding well in low-grade ore, which is being worked in the mills on the Carson river. The exploring drifts are finding more or less ore, giving assurance of a supply sufficient to keep the mills going for many months to come.

CONSOLIDATED VIRGINIA.—Water having made its appearance in the main south drift on the 2900 level, the diamond drill has been put into the face and is being sent ahead to explore the ground, which gives signs of being very wet.

ANDES.—The north drift along the hanging wall is in a streak of quartz of good quality, which yields some paying ore. The bottom of the winze continues in porphyry, with some stringers of quartz.

SIERRA NEVADA. Work has been commenced on west crosscut No. 4, but has not yet progressed so far as to show rock very different from that found in the main north drift. The ground is dry and blasts very well.

ALPHA CONSOLIDATED.—Good progress is making in the north drift, and much quartz of a very favorable appearance is being encountered.

CROWN POINT.—The mine is yielding the usual quantity and quality of ore, keeping the mills on the Carson river in constant operation.

Columbus District.

THE WEEK'S OPERATIONS.—Candelaria *True Fissure*, July 16: The east drift from winze No. 5 shows a small amount of ore. At the raise from the east drift on the third level, a strong ledge has been developed, but it is a good deal mixed with waste. The west drift from the north crosscut, on the third level, is in 24 feet, and shows a little ore. The west intermediate, between the first and second levels, is in 112 feet, and shows some $40 quartz that looks promising. The east drift on the first level is giving some $60 ore from an irregular ledge. A small amount of ore is being taken from the west drift on the first level. During the week about 300 feet of track has been put in on the fourth level, and the work of extending the west drift has been begun. The face of this drift shows some $60 quartz. The incline has been sunk 15 feet during the week, and is now 209 feet below the third level.

Peavine District.

STRUCK THE LEAD.—Reno *Journal*, July 16: Capt. Griffith brought in from Peavine a large sample of the ore recently encountered in the Poe ledge. He started a tunnel last fall and has run in 475 feet. Last Saturday night the miners cut into the ledge which they have been expecting to strike at every blast for the past fifty feet. They have gone into the ore about four feet. It is a solid mass of black sulphurets ore, such as gave the mine its reputation in early days, and is very much like the rich ore found in the Pyramid mines. It will run from 40 to 60 per cent. in copper, and is rich in gold and silver. It is exactly what the Captain expected to find, and he is, naturally enough, very much elated. The tunnel cuts the ledge 225 feet below the surface.

White Pine District.

MINING OUTLOOK.—White Pine *News*, June 16: The "Chief" a new discovery on Treasure Hill, on the trail leading from Hamilton, is the property of James Reilly, and is now being developed by him. It is said to show up well in average grade ore—say $50 to $70—and there is a large quantity in sight. While it will not pay for shipping, it can be worked to a handsome profit in the camp. Mr. Jack Gilmer and his experts were over examining it the other day, and they were well pleased with its prospects. They may purchase the property, but whether they do or not, Mr. Reilly will continue developments as long as the prospects are so favorable.

THE SWEETWATER.—With the exception of a few men working in the Wheeler tunnel, this company is doing nothing at present. Mr. Robinson, its managing director, is in New York, endeavoring to raise funds to erect leaching works and start in on that process. He was to have returned several weeks ago, but now his return is not definitely set. The company has some valuable property, but they have never raised means enough to start in to develop it in a way that was sure to put it on a permanent paying basis.

THE JENNIE A.—Is said to be looking encouraging. Developments are being pushed, and the results are very encouraging. This company contemplate running a furnace this summer. Their showing is perhaps the best in White Pine.

EBERHARDT.—Bros. Townshend and Hayes took us down to the once lively, but now almost deserted town of Eberhardt. Like Goldsmith's "Deserted Village" its glory seems to have departed. Oliver Drake, at the company's office, was the only man we met in the place. From thence we went up into the tunnel, where we found Capt. Drake and his machinist, J. L. Robertson, very busy repairing some machinery that had gotten out of order. The Captain was putting in hard licks. To our inquiry about the prospects in the tunnel, the Captain smiled and said they had "nothing big." He showed us samples of ore he had been encountering in small bunches for some time. It looked fair, a little base and altogether different from that found in the upper working. The Captain told us the situation in the tunnel was such as to encourage him and his company to go on prospecting but nothing more.

TYBO.—Eureka *Sentinel*, July 16: M. Brougher returned yesterday from a trip to Tybo since the fire. He says the little old camp looks about as bad as possible, literally in ashes. The people hardly know what to do, whether to build up or not, for the camp is by no means lively. Mr. Trowbridge says the loss of the company by the burning of its branch store was put in too high, as he succeeded in saving some $2,000 worth of goods from the flames. The company's mill will start up Monday. The mine is looking first-rate, and there are 1,500 tons of ore on the dump to be reduced.

Santa Fe District.

RICH ROCK.—Walker Lake *Bulletin*, July 16: Some very rich rock has been struck in the Confidence mine, near the Stone Cabin, in Santa Fe. The tunnel is in 150 feet, and is being pushed very fast. Mr. Smith, of Candelaria, has two men at work on his mine.

Gillis Mountain District.

ORE.—Walker Lake *Bulletin*, July 16. Benton and Kennedy are getting their mine, in Gillis Mountain, in good shape, and will soon make a shipment, as they have a fine lot of ore in the dump.

Taylor District.

MEN.—Cor. Eureka *Sentinel*, July 15: There are a great many strangers in our midst, and about as many men as the companies need to do their work. I would advise no one to come here hunting work. Our principal mines—the Monitor and Argus—are looking well and turning out their usual quantity and quality of ore. Considerable prospecting is going on around our camp.

Bullion District.

OPENING A MINE.—*Silver State*, July 16: C. H. Egbert, who has been here for some time, left last week for Bullion District, east of Lewis, to take charge of the Lady of the Lake mine, which has been incorporated, and which the company has concluded to develop.

ARIZONA.

TIPTOP DISTRICT. Cor. Phœnix *Herald*, July 12: The Basin mining camps are in the Tiptop district, lying, on a bee line, one and a half miles from Humbug, on the same lode, some of the veins being located the entire distance. The Basin is on the east side of the ridge and rich in silver; Humbug is on the west side and rich in gold. The miners in Basin endeavor to make the properties pay as they are being developed. A few consignments to San Francisco paid, and some ore worked at Gillett paid a dividend, but the chloriders were unable to keep out of debt until they commenced shipping ore to Benson. I was surprised at the thrift and extent of these mines, almost unknown to the outside world. The chloriders handle no ore that pays less than $100 per ton. Mr. H. W. Coulsen has been chloriding for seven years and never made it pay till he commenced to ship to Benson. Mr. Coulsen has more or less developed several claims. On the Silver Hatchet he has two shafts connected with a tunnel that show a 10-inch vein of $50 ore. He has two claims on the Crescent lode, one of which has a 112-foot shaft that has yielded about $18,000 worth of high-grade ore by selecting the best, but the 5-foot vein averages about $40 per ton. The other claim he calls the Comet, and from an 80-foot shaft on a 20-inch vein he selects ore that sells in Benson for $400 per ton. The Crescent lode runs north and south through the district cutting at right angles all the other lodes, which run east and west. James Hasner has a good showing on a claim near Coulsen's. He has tunneled the mountain for 60 ft along the vein and raised to the surface with a shaft. He has ready for shipment about 10 tons of $400 ore. The old Barnum mine is yielding high-grade ore, and the Swilling mine has good prospects. It is generally conceded, however, that the Smithline brothers have the boss mine of the district, so far as present developments have shown. They have a tunnel run into the hill 65 ft along the lode, at the end of which a 05-foot shaft penetrates high-grade ore for 30 ft. The ore from this shaft brought them $5,500. From the bottom of the shaft they have tunneled the vein under the above tunnel in high-grade ore for 140 ft. The lower tunnel filled with water last winter and remains so. They then commenced a perpendicular shaft to strike the lode across a ravine and went down 77 ft and it is yet dry. From the bottom of the shaft they run a 20-foot tunnel back along a 5-inch vein of bullion, on which the eagle's wings are already sprouting, for some of it will go $20,000 to the ton. About 110 ft more will connect the two tunnels, and machinery will be erected for reducing the water preparatory to stoping. Here are five mines that look better than the Tiptop did at the same stage of development, while it never equaled the Smithline mine. Another valuable mine belonging to Jo Meyer and several others is lying idle because the partners disagree. The pleasing feature of the camp is that the owners are practical miners that are making the mines pay their way without any uncertain investment.

Jackrabbit District.

DAY FURNACE.—*Pioche Record*, July 16: At Bristol the furnace was not in shape to run till Tuesday, when it was started up at noon, with twelve-hour shifts. The furnace is run at much less expense than heretofore, and the company saves about $16 per day, or $480 per month. The new hands from Utah desired to work 12-hour shifts, so the smelters now get $5 per day in place of $4, and the helpers $4 in place of $3½. It is thus seen that the helpers get one-bit for each extra hour's work, or four-bits for the four extra hours, while the smelters get two-bits for each extra hour, or $1 for the four extra hours. This is big pay to Utah men.

Esmeralda District

AURORA REVIVING.—Walker Lake *Bulletin*, July 14: Several of the mines at old Aurora are now doing well, and the citizens are jubilant over the prospect of the resumption of the old time activity. Judge Seawell and John Neidy are working the New Esmeraldo to advantage. A short time since a working sample of their ore was milled, and the result assures a profitabe result to their enterprise. The Silver Lining, the Poor mine and others are also doing well, and, while not making much noise, Aurora is getting ready to stand near the head of the list of bullion producers.

Palmetto District.

MINING INTERESTS.—Virginia *Enterprise*, July 17: Guy Thorpe has arrived at Carson from Palmetto District, and speaks well of his mining interests at that place.

Patterson District.

GOOD INDICATIONS.—Eureka *Sentinel*, July 14: We had a talk with C. M. Thaxton, of Hamilton, in regard to Patterson District, which is situated in Lincoln county, east of the road to Bristol, and is reached by a turn off some seven or eight miles south of Parker's Station. In the lively days of Pioche Judge Flowers, an old-time miner with a world of experience, left the excited camp on a prospecting tour and found flattering indications in Patterson. The district was worked, off and on, after that time, but had been abandoned for a great many years, when last fall, Judge Flowers took a trip over there. He tried some croppings, and with a single blast uncovered a body of very rich ore. Some work was done on the extensive croppings, but the bad weather of last winter and spring hindered extensive developments. Down to a depth of forty feet the indications were that the Matthewson Brothers, Judge Flowers and General Coulter were going to have another Eberhart; but there a porphyry "horse" came in, and the ledge, which is between porphyry and lime, threatened to pinch out entirely. On going through the "horse," however, the ledge was found again at once and the hopes of the owners of the property are now stronger than ever. The ore, which is generally chloride of silver in the places, is very rich and holds steadily between $200 and $800, some of it going, however, high up into the thousands, and other ore, but little of it, falling down to $120. A considerable quantity of this precious stuff is sacked up at the mine, and negotiations are going to have it reduced at Bristol or to ship it on to Salt Lake for reduction. Some of it is free milling and some roasting ore. It is so rich that it would pay handsomely for shipment even to Swansea. There are five or six men at work taking out and sacking ore, the value of which is determined regularly by assay. It is being piled up and definitely labeled, so to speak, with its coin value. The men employed in the mine were engaged to work for $2 a day and grub furnished, with the further agreement that if the yield of the mine went beyond a certain income fixed upon by the owners, the pay of the miners should be increased in proportion. On these terms the men have been, and are, making, above expenses, from $5 to $6 per day each. How extensive the property will turn out to be is bare speculation, but hopes are entertained that it will become a large, permanent, paying mine.

ORE SHIPMENTS.—Prescott *Courier*, July 16: Mr. Cox reached Prescott yesterday morning from the Dosoris mine. He reports regular shipments of ore, and that the ledge in the Buzzard mine, at a depth of 100 feet from the surface, is fully three feet wide. Mr. Dawes, day before yesterday, made a large shipment of quicksilver to Mr. Chase, of Pine Flat, whose mill will soon be running on gold rock. The Bueno mill and concentrators are treating ore from the Holmes mine. Concentrators will be shipped to Eastern reduction works. A citizen who came recently from Jerome tells us that the 30 ton smelter (Fraser & Chalmer's make) is running out a great deal of copper-silver bullion, and that Superintendent Thomas is shipping his richest ore to the East. There are, in sight, immense bodies of ore, a sight of which will satisfy any mining man that United Verde is one of the greatest mining properties in the world. It is proposed to start the Kimball mill Thursday next. All are in hopes that it will be a success. More attention will hereafter be paid to places where placer gold exists. The Crook and several other gold mines in Hassayampa district, twelve miles south of Prescott, carry very rich rock. The White Spar mine is showing up well. Turkey creek mines please all practical and scientific men who have examined them and are certain to pay well. There is a rumor to the effect that the Howell reduction works will be started up about the first of next month. The Middleton mine, near the head of Lynx creek, is favorably mentioned by experts.

GROOM CREEK.—C. H. Aaron, the well-known assayer and metallurgist, has just returned from Groom creek district, six miles south of Prescott, and tells us that his observations there strengthen him in the belief that it will soon become a thrifty camp. The ledges (no top) carry gold; but, as depth is attained, silver is the metal. Mr. Clerk has let a contract for the extraction of ore; put his mill in better fix to save the precious metals, and will, very soon, take a fresh start.

COLORADO.

CASCADE DISTRICT.—Georgetown *Courier*, July 17: A number of prospects are being worked and a spirit of activity is noticeable. Good ore is being produced, and the properties of the section are being quite extensively developed. The Eclipse mine is working its usual force of men—about fourteen—with good results. Considerable gray copper is found scattered through the quartz in the Silver Link adit, which is being driven ahead. Lessees are crosscutting from the 150-foot level of the Charter Oak lode to reach the hanging wall. The Cascade is being worked by lessees. A recent shipment of 48 sacks of ore milled 127 ounces silver per ton in one class. Pat Hefferner is developing his Gray Copper lode on Chicago creek, and is doing well. A crosscut is being driven for the lode. The Gow brothers are working the Denver View lode, at the head of Cascade creek, and are taking out some good mineral.

NOTES.—Three carloads of ore from the Joe Reynolds were shipped yesterday. A large body of ore, carrying gray copper and ruby silver, is exposed in the Fulton lode. About $4,000 was taken out of a shaft on the Fred Rogers lode, in sinking a depth of 30 ft. A good streak of ore is shown in the Watts lode, Brown mountain, which runs over $500 per ton. Considerable gray copper and sulphuret ore has been encountered in the Detroit lode, Kelso mountain. We learn extensive developments will be made on the Backbone mine as soon as it is free from water. The mine is producing some good mineral. A new car and track is being placed in the tunnel of the Monarch lode, in Daily district, and an ore house and blacksmith shop is being erected. It is reported that there are two levels on the Black lode, in Cascade district, in which the pay streak is continuous for 50 ft, averaging about three inches in width. Reed & McGrath's recent strike on the Chelsea Beach lode is turning out well. They have a good streak of mineral, assays from which run as high as 1,700 ounces silver. Mr. George Cox let two leases on the Bismarck mine last week. One is for 300 ft on level No. 3, and the other to sink 125 ft from the same level, and to run 500 ft. Summit county is excited over a recent rich gold find in Gibson gulch, near Breckenridge. The dirt is reported as giving from 50 cents to $3 per pan. Two citizens of Dumont recently struck a 16-inch streak of galena ore which is scattered through quartz at the grass roots. They have christened the find the Rustic. Twenty tons of ore were shipped from the Stevens mine on last Saturday. A mill-run of 22 tons was also had from this mine recently, which returned 130 ounces silver and 50 per cent lead. The first shipment of ore from over the range was made a few days ago by Wilson & Webb, from a mine at Williams Fork. There were 400 sacks of ore, which milled an average of 125 ounces silver per ton. Wood & Welch, lessees on the White, have a good streak of mineral. They are drifting and stoping. Potter & Co. are reported to have a streak of ore over 20 inches wide, which mills from $80 to $150 per ton. In the bottom of the shaft upon the Big Horn lode, near Dumont, a good strike was made on Saturday last. The character of the ore is copper, galena and silver glance, and assays 2,700 ounces silver to the ton.

IDAHO.

EAST FORK OF SALMON.—Ketchum *Keystone*, July 15: Persons just in from Germania Basin on East Fork of Salmon, give us the following items of interest concerning mining operations in that new district. The Idaho, Bibleback and San Doorne mines have been worked on leases since late last fall by light forces, and have shipped among them sixty tons of first-class lead ore to the Clayton smelters. The ores of these claims is entirely lead and iron oxides of lead very similar in character to the ores of Lower Wood River. Until within the past six months they were worked entirely at Bayhorse, but now find a better profit in reduction at the Clayton works on the Salmon, sixteen miles south of Bayhorse. The Germania began mining for ore two weeks since, and will employ a small force during the present working season. The Germania is the celebrated claim that first drew attention to that promising region, and from which the surrounding country took its name. Seven tons of good ore has been extracted from a new claim known as the "Fraction" in Germania Basin, which promises to be one of the finest properties in the region. The mining outlook of this section of Idaho is indeed flattering, and is at present suffering nothing of the inactivity that besets other equally as prominent localities. The miners of Germania Basin have the correct idea of developing their possessions, and in patronizing the Clayton smelters are keeping up quite a current of life between the two points.

MONTANA.

ANACONDA.—*Inter-Mountain*, July 15: The concentrator and smelter are now in an advanced state of completion. The concentrator will have a daily capacity of 500 tons, and the furnaces of the smelter will be fully able to treat the product. The ore will be dressed by jigger process, and such is the location and arrangement of the works that water power and the force of gravitation will prove readily capable of handling every pound of ore from the time it leaves the rollers in the concentrator until it is turned out as matte in marketable form by the furnaces. The saving thus affected in machinery, fuel and labor will be immense. The system and clock-work regularity, with which the construction of the vast enterprise is managed, and the labor of the army of employees is directed excite the wonder and challenge the admiration of all. It is stated that nearly $800,000 have thus far been expended on the works, but despite this vast outlay of money, there has been no waste, no extravagance. Every man employed does his full day's work, and scarcely a nail is allowed to be thrown away. A thousand hammers and saws are at work on the mighty structure, and Babel was a quiet place in comparison, but the idea is to do as much work as possible within the next thirty days, and then only the finishing touches will need to be applied. The smelter, a structure over 500 feet in length, and so wide that the 60-stamp mill of the Alice could be stowed in one end of it.

OREGON.

CLEANING UP.—Jacksonville *Times*, July 12: The Sterling Mining Co. is cleaning up. Walter Simmons, of Galice creek, is making a fine clean-up. He has taken out $3,000 as far as known. Work has been suspended at Sturgis' drifting diggings on Forest creek, owing to the scarcity of water. Green Bros., of Galice creek, have run their tunnel 100 feet, and expect to strike the ledge before long. The Cœur d'Alene excitement is slowly dying out. W. T. Clemons has returned to Galice creek, where he will engage in prospecting. He has been in charge of the English Co.'s mines in that district. Mr. Arnott, who is mining the bed of Galice creek, is taking out an ounce a day. He has averaged half an ounce per diem ever since he commenced this season. Jas. Maloney has taken charge of the Steam Beer mines in the Grave creek district, which are owned by Thos. Criteser and other Roseburg parties. They will be put in good shape for next season's work. There is quite an excitement over the discovery of quartz on the Santiam river in Linn county, and several claims have been located. A mill is being put on the site of the discovery, which is said to be rich. Our Rock Point correspondent says: J. H. Pomeroy and C. W. Burrage, the owners of the extensive iron beds four miles above Rock Point, arrived there a few days since, and will commence developing their mines early next week.

UTAH.

REVIEW.—Salt Lake *Tribune*, July 16: The week has been distinguished by showery weather—something altogether unusual for this Territory in July; and which has not tended to the betterment of the canyon roads. The receipts of bullion in this city for the week ending July 16th, inclusive, amounted to $111,844 43; no ore. For the previous week, the receipts were $131,855.53 in bullion, and $3,800 in ore. The shipments of the Horn Silver for the week were nineteen bars of bullion, $57,000; total for the year 1884 to date, $1,277,000. The receipts from the Ontario for the week aforesaid, were fifty-six bars, $43,304.43; bringing the total product for the current year up to $870,853.80. The product of the Hanauer smelter for the week was two cars of bullion, $4,000. The Stormont sent up during the week, two bars of silver, $3,540. And there was received $4,000 in bullion from Nevada. The week was rather a quiet one, and the difficulty of getting full supplies of ores from the hills has told on the product of the smelters.

MANUFACTURERS OF IMPROVED AND APPROVED FORMS OF

MILL AND MINE MACHINERY.

Having made extensive additions to our Shops and Machinery, we have now the LARGEST and BEST APPOINTED SHOPS in the West. We are prepared to build from the Latest and Most Approved Patterns,

QUARTZ MILLS

For working gold and silver ores by wet or dry crushing. The Stetefeldt, Howell's Improved White, Stanton's & Bruckner Furnaces, for working base ores. Rotary Dryers, Stetefeldt Improved Dry Kiln Furnaces.

SMELTING FURNACES,

Water Jackets, either Wrought or cast Iron, made in sections or one piece, either round, oblong, oval or square. Our patterns most extensive in use. SPECIAL FURNACES FOR COPPER SMELTING. Slag Pots and Cars. Improved form. Bullion and Copper Moulds and Ladles, Litharge Cars and Pots, Cupel Furnaces and Cars.

Frue Ore Concentrator, or Vanner Mills.

Coarse Concentrating Works, Improved Jigs, Crushing Rollers, Sizers, Trommels, Rittenger Tables, and all other adjuncts for the proper working of Gold, Silver and Copper Ores, complete in every detail.

HALLIDIE IMPROVED ORE TRAMWAYS. We refer to Gen. Custer mine, Idaho, 5,000 feet long; Columbus Mine, Cal., 4,750 feet long; Mary Murphy mine, Col., 5,000 feet long, all in constant operation.

LEACHING MILLS,

Improved Corliss and Plain Slide Valve Meyer's Cut-off Engines.

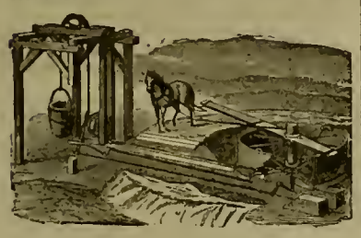
CORLISS ENGINES from 12x36 Cylinders to 30x60. PLAIN SLIDE VALVES from 6x10 to 36x36. BOILERS of every form, made of Pine Iron Works O. H. No. 1 Flange Iron, or Otis Steel. Workmanship the most careful. All Rivets Hand Driven.

HOISTING ENGINES Large or Small for flat or round rope. Double Cylinder Engines, from 6x10 to 18x60. This latter size furnished J. B. Haggin or Olant and Old Abe Co., Black Hills also Corliss Pumping Engines, 26x60, for Hoisting and Pumping Works, for 2,000 feet deep. **Baby Hoists for Prospecting, 4 H. P. to 6 H. P.**

Wire Rope, Safety Cages and any Size and Forms of Cars. **McCaskell's Patent Car Wheels and Axles—Best in Use.**

Principal Office and Works, Fulton and Union Sts., Chicago, Illinois. **New York Office, Walter McDermott, Manager, Room 32, No. 2 Wall St.**

MINERS' HORSE WHIM.



ONE HORSE CAN EASILY HOIST OVER 1,000 LBS. at a depth of 500 feet. The Whim is mainly built of wrought iron. The hoisting-drum is thrown out of gear by the lever, while the load is held in place with a brake by the man tending the bucket. The standard of the whim is bolted to bed-timbers, thus avoiding all framework. When required, these whims are made in sections to pack on mules.

120 in Actual Use.

T. E., Box 2361, San Francisco, Cal.

Photo Relief and Wood Engraving

Among the late discoveries in the Economic Arts stands prominently that of Engraving by the Art of Photography. While the new methods and processes greatly lessen the cost of producing the special kinds of printing plates most suitably made by the aid of photography, one of the best results gained is the perfect accuracy that is obtained.

Improvements are being continually made through more experienced workmanship, and ingenious and wonderful inventions that are exceedingly interesting and useful.

Portraits of men and women are made remarkably perfect in likeness. The same of animals plants, flowers, fruits, vegetables, landscapes, buildings, etc.

Nearly all kinds of engravings for books, pamphlets, trade catalogues, circulars, cards, handbills, labels, certificates, and other varieties of printing, are made with great advantage and desirability.

Some kinds of illustrations can still best be done on wood, and will long continue to be so made, for various reasons. It is our purpose to use the best available methods for accomplishing economically the most satisfactory results, and work is therefore solicited for all kinds of engraving.

All Publishers, Printers, Societies, Schools, Companies, Scientists, Professional Men, Merchants, Stock-raisers, Horticulturists, Mechanics, Manufacturers, Tradesmen, and all others requiring Engravings, should call and inquire, or write particularly for any further information desired, to the OFFICE OF THIS PAPER.

On inquiring prices, send samples of work similar to that desired, when practicable, or otherwise give as clear an idea as possible of just what is wanted.

☞Satisfaction guaranteed on all orders.

Springfield, Ohio, and 110 Liberty Street, New York City

PARKE & LACY, General Agents, **21 & 23 Fremont St., S. F.**

JENKINS PATENT VALVES.

Gate, Globe, Angle, Check and Safety.

Manufactured of BEST STEAM METAL. We claim the following advantages over all other Valves and Gauge Cocks now in use:

1. A perfectly tight Valve under any and all pressures of steam, oils or gases.
2. Sand or grit of any kind will not injure the seat.
3. You do not have to take them off to repair them.
4. They can be repaired by any mechanic in a few minutes.
5. The elasticity of the Disc allows it to adapt itself to an imperfect surface.

In Valves having ground or metal seats, should sand or grit get upon the seat it is impossible to make them tight except by regrinding, which is expensive if done by hand, and if done by machine soon wears out the valve, and in most cases they have to be dis connected from the pipes, often costing more than a new valve. The JENKINS Disc used in these Valves is manufactured under our 1880 Patent, and will stand 200 lbs. steam. Sample orders solicited. To avoid imposition, see that Valves are stamped "Jenkins Bros." For sale by

DUNHAM, CARRIGAN & CO., San Francisco, Cal.

Arizona Notes.

[From a Tucson correspondent.]

EDITORS PRESS:—Affairs in this vicinity are exceedingly quiet. People are apparently waiting for developments in Quijotoa. There is some talk of the introduction of water from the Santa Catarina, and surveys have been made with an idea of bringing water to the city from this source, which is said to be at an elevation of about 10,000 feet above sea level. Some of the prominent citizens are taking part in the enterprise, and the scheme will probably be offered in San Francisco with the idea of getting capital there.

The stage line from Casa Grande has drawn off the regular trips to Quijotoa, but two lines of stages run daily from Tucson to that famous district.

On the evening of the 10th news was received of a strike on the east side of Quijotoa, in both the Peerless and Crocker ground, where some ore of fair grade is reported as struck. Our papers here published it as a rumor, but it is nevertheless a fact.

It is stated that the tunnels are open to inspection of the public, which is a new turn in the state of affairs, as it is commonly understood that the miners are not allowed to come down from the top of the hill; and by general experience I should think this true, as I was stopped on the trail and not allowed to go up. It is to be hoped these rumors of a strike are correct, as everything here in Tucson appears dependent on the success of these properties. We know that the several tunnels have been driven in both sides of the hill, but as yet nothing definite of any ore being found is learned. In fact it seems strange that the bonanza people should choose to grope in the dark before determining what they had.

The Babroquiva water scheme has been taken up by some Eastern parties; and to us old pioneers it seems strange that any one should put their money into such an enterprise. It is not long since I made a "dry camp" on this identical spot. Water runs here at certain seasons, but during September and October there is little water to be found, and the "solitary horseman" has to quench his thirst elsewhere.

They say the boys are going to strike it rich over at the Covered Wells. Everybody wishes them well. Sanlsbury & Co. keep their boys hunting the country for smelting ores for their smelter at Benson. They thought they had struck it rich in a carbonate mine near Phœnix the other day, but the ore did not "hold up." At Hassayampa they had a good galena mine, but have worked out their first deposit.

A number of mining men have passed through our town within the past few weeks for the purpose of investigating some of the rich mines of this region of the country. Among them was Prof. Price. We hear he has been over at Bisbee to see the Copper Queen. It is to be hoped he found the mine in good shape, with lots of copper for our English friends, though our information from there does not warrant us in making this statement, as we are afraid it is a little weak in the bottom, the lower levels having "gone back" on them. However, I give you this for what it is worth. X.

COPPER.—Liverpool advices state that American arrivals of copper ore and matte continue in large quantities. Arrivals then, for the United States in June, equaled 1,720 tons of fine copper, and included in the lot was 3,790 tons of copper ore. The market has been dull, and quotations by Lewis & Son's report, are: Good ore of 25 per cent., 10s. 6d.; Chile regulus, 11s. per unit; Chile bars, £54 to £54 5s. Arrivals from Chile in June were 2,096 tons, and from other countries, 3,345 tons fine copper. Chile exports, from June 1st to June 30th, equaled 23,504 tons of fine copper. The total visible supply of copper ore July 1st was 46,641 tons fine. For the first six months of the year Liverpool and Swansea imported from this county 6,918 tons fine copper.

LEAD is selling in Liverpool at £10 15s. to £11 for English; £10 10s. to £11 for Spanish with silver; and £10 5s. to £10 10s. for Spanish without silver.

MR. W. R. ECKART, the Mechanical Engineer of this city, is superintending the construction of the smelter at Anaconda, Montana.

FRASER & CHALMERS, of Chicago, are filling a heavy contract for machinery at the new smelter at Anaconda, Montana.

ANTIMONY is selling in Liverpool at £41. and £42 per ton.

To Subscribers.

While our paper is, generally speaking, very prosperous, the publishers find themselves more than usually in need of money at this time, as our expenditures are constantly large. Those who have been waiting for busy times, or for other reasons, before renewing subscriptions and making payments to this office, are now kindly urged to favor us at as early a date as possible. Also, please remember that it is a good season to suggest to others that they, too, profit by subscribing. We hope to hear from many within the next few weeks, from all along the line of our large subscription list of intelligent and appreciative readers.

Mining Share Market.

There has been a pretty lively market for stocks during the week, but prices have not been maintained. At the north end of the Comstock the outlook is improving. In the bottom of the deep winze the rock is changing for the better. Porphyry is beginning to take the place of the black bastard quartz in which they have for sometime been sinking. As yet this porphyry is in detached bunches, but doubtless a permanent stratum will soon be reached, and in connection with this fertile quartz may be expected.

In the Best and Belcher and Gould and Curry they are making a start, looking to extensive explorations in their upper levels in sections of the two mines where there are large areas of virgin ground.

At the Hale and Norcross work has not yet been resumed on the 2800 level. The last work done on that level showed better material than any heretofore found at that point.

At Gold Hill the Yellow Jacket, Crown Point and Belcher Companies are extracting and sending to mills on the Carson river the usual quantity and quality of ore.

At the Alta they have the diamond drill in a distance of about 500 feet in advance of the west drift on the 2150 level. They have thus far found no water that will interfere with the running of a drift to the westward.

Bullion Shipments.

Stormont, July 15, $2,540; Nevada, 15, $4,000; Horn Silver, 15, $12,000; Ontario, 15, $6,638; Horn Silver, 16, $12,000; Ontario 10, $18,402; Horn Silver, 17, $6,000; Ontario, 18, $5,994; Horn Silver, 18, $12,000; Crescent, 10, $2,850; Nevada ore, 19, $2,600; Horn Silver, 19, $6,000; Ontario, 19, $12,119; Horn Silver, 20, $9,000; Ontario, 20, $6,704; Bodie, 22, $11,585; Navajo, 21, $10,000; Bodie, 23, $11,585; Bonanza King, 11, $10,634.

Our Agents.

OUR FRIENDS can do much in aid of our paper and the cause of practical knowledge and science, by assisting Agents in their labors of canvassing, by lending their influence and encouraging favors. We intend to send none but worthy men.

IMPORTANT additions are being continually made in Woodward's Gardens. The grotto walled with aquaria is constantly receiving accessions of new fish and other marine life. The number of sea lions is increased, and there is a better chance to study their actions. The pavilion has new varieties of performances. The floral department is replete and the wild animals in good vigor. A day at Woodward' Gardens is a day well spent.

News in Brief.

QUEEN VICTORIA has telegraphed congratulations to President Arthur on the Greely rescue.

A GENERAL complaint is made in Solano county that melon vines are being destroyed by some kind of insects.

THE tax valuation of Chicago is real and personal, about $133,000,000; that of Cincinnati for the same year (1883) was $169,000,000.

TWENTY-SIX glass blowers have arrived in this city from Eastern glass works, to work for the San Francisco and Pacific Glass Works.

THE Purissima Oil Company struck considerably more oil and gas yesterday at a depth of 108 feet.

DURING the past year the receipts of the Society for the Prevention of Cruelty to Animals aggregated $12,372.50, and expenses $1,769.48.

THE Holiness Association, a religious organization of this coast, with headquarters in San Francisco, is building a tabernacle in Oakland.

THE effect on the summer travel to Europe caused by the outbreak of cholera is said to be simply enormous.

THE First Cremation Society of San Francisco appointed a committee to draft a petition to the Legislature, which will be endorsed by physicians, advocating burning the dead.

J. M. THOMPSON and others propose to bring water from North Beach through Stockton street to the corner of Fourth and Market, for use in salt water baths.

THE condition of the Thames excites alarm in London, for the sewage, though discharged far below the city, washes up past the House of Parliament.

THE Government has decorated Dr. Koch with the cross of the Legion of Honor in recognition of his researches as to the source and spread of the cholera.

THE loss from the great fire Saturday at Crane wharf, Wapping, reaches $2,500,000. The largest quantities of oil stored at the wharf were not much damaged.

THE machinery for the electric lighting of Holl Gate is so nearly completed that it is expected to be in operation by the first week in August.

THE assessment rolls of Napa county show a valuation of property in Napa county of $11,-014,000, which is an increase of $385,000 over the assessment of last year, including the 10 per cent added by the State Board.

COMPLIMENTARY SAMPLES OF THIS PAPER are occasionally sent to parties connected with the interests specially represented in its columns. Persons so receiving copies are requested to examine its contents, terms of subscription, and give it their own patronage, and, as far as practicable, aid in circulating the journal, and making its value more widely known to others, and extending its influence in the cause it faithfully serves. Subscription rate, $3 a year. Extra copies mailed for 10 cents, if ordered soon enough. Personal attention will be called to this (as well as other notices, at times), by turning a leaf.

Cheap Ore Pulverizer.

There is for sale in this city, by I. A. Heald, American Machine and Model Works, 111 and 113 First streee, a Rutherford Pulverizer, an improved revolving barrel crusher, which was only used a few times and is as good as new. It will be sold very much below costs, and miners who are in need of such an appliance for a small mine will do well to make inquiries concerning it. It is suitable for a pulverizing mill for powder or other substances. References as to above can be had upon applying to this office.

Don't Fail to Write.

Should this paper be received by any subscriber who does not want it, *or beyond the time he intends to pay for it*, let him not fail to write us *direct* to stop it. A postal card (costing one cent only) will suffice. We will not knowingly send the paper to anyone who does not wish it, but if it is continued, through the failure of the subscriber to notify us to discontinue it, or some irresponsible party requested to stop it, we shall positively demand payment for the time it is sent.

PATENTS AND INVENTIONS.

List of U. S. Patents for Pacific Coast Inventors.

[From the official list of U. S. Patents in DEWEY & Co.'s SCIENTIFIC PRESS PATENT AGENCY, 252 Market St., S. F.]

FOR WEEK ENDING JULY 15, 1884.

302,083.—STOVE POLISHING BRUSH—A. D. Arper, S. F.

301,954. SWINGING DEMIJOHN AND LABEL HOLDER—L. Brand, Alameda, Cal.

301,957.—ATTACHMENT FOR BILLIARD TABLES—E. Brunswick, S. F.

301,967.—HAND BLOWER—Geo. Cumming, S. F.

301,885.—FIRE PLACE—F. D. Haven, Albany, Or.

301,857. CARTRIDGE IMPLEMENT—H. T. Hazard, Los Angeles.

301,985.—GANG PLOW—Robt. Hendricks, Woodside, Cal.

301,988. SPRING SEAT FOR WAGONS—J. Hodgess, Loyalton, Cal.

301,992.—OPERATING PUMPS IN MINES—P. A. Humbert, S. F.

301,993.—PUMP—P. A. Humbert, S. F.

302,003.—HYDRAULIC ELEVATOR—A. F. Knorp, S. F.

302,012.—CLUTCH—W. Mathews, San Jose, Cal.

302,024.—SAFETY GUARD FOR CARS—L. Peterson, S. F.

302,040.—STEP LADDER—E. A. Shumway, Walnut Creek, Cal.

301,932.—WATER CLOSET VALVE—Wm. Smith, S. F.

302,179.—WATER METER—Frank Walker, Tombstone, A. T.

302,066.—STEP AND EXTENSION LADDER—Robt. Walker, Oakland, Cal.

NOTE. Copies of U. S. and Foreign Patents furnished by DEWEY & Co., in the shortest time possible (by telegraph or otherwise,) at the lowest rates. All patent business for Pacific coast inventors transacted with perfect security and the shortest possible time.

Notices of Recent Patents.

Among the patents recently obtained through Dewey & Co.'s SCIENTIFIC PRESS U. S. and Foreign Patent Agency, the following are worthy of special mention:

STEP AND EXTENSION LADDERS.—Robert Walker, Oakland. No. 302,066. Dated July 15, 1884. This ladder is one that may be used as an extension or step ladder at will. It consists of two ladder sections united by a rod and slotted connections, so that the two parts being united at one end may be separated at the other in a manner of an ordinary step ladder; or by extending the two in line they may be locked together, so as to form a rigid continuous ladder of nearly double the length of either section.

SAFETY GUARDS FOR CARS. Lewis Peterson, S. F., No. 302,024. Dated July 15, 1884. This safety guard for cars and other heavy moving objects, consists of a combination of devices. The principal object is to prevent such accidents to life and limb as are of frequent occurrence in cities, occasioned by persons being run over by street cars. The safety guard, patented, may be applied to cars and moving bodies of all kinds to prevent any object in front of the car from being run over or injured to any considerable extent.

STEP-LADDER AND TRESTLE.—Edward A. Shumway, Walnut Creek, Contra Costa Co., Cal. No. 302,040. Dated July 15, 1884. This invention relates to an improved construction for step-ladder trestles, or supporting frames, which have the upper ends united together so that the lower end may be separated to form a bracing-support. It consists of side-bars, with their upper ends bored out at their meeting points to receive short cylinders, which fit half in each bar, and are retained in place by straps. The upper ends of the bars are cut away to form an obtuse angle with the inner edges at this point, to allow the lower ends to be opened and closed. The device may be applied to a step-ladder having steps on one side and braces at the other, or it may be used upon what is known as a "French ladder," having steps on both sides, or upon trestles, such as are used by painters and others.

SAW MILL SET WORKS.—Ambrose A. Osborn, S. F., No. 301,828. Dated July 8, 1884. This is what the inventor terms "power set works" for saw mills; and it consists of a mechanism, by which the log may be set upon the carriage for any desired cut, and a dial or indicator connected with said mechanism, so that the amount set may be shown at once. In saw mills where long logs are to be sawed, considerable time must be consumed in setting the logs for a new cut each time after the carriage has been run back, and also set all the standards equally throughout the whole length of the log. These improved set works simplify the whole operation.

Prompt Payment Needed.

It would be of great assistance to the publishers of this journal to have all its patrons renew their subscriptions promptly, save the expense of collections, avoid the changing and shifting of the position of the names on the printed mail list, and prevent some of the chances of errors occurring in addressing and mailing our very large list of subscribers. We, therefore, kindly urge upon all those who possibly can to renew their subscriptions early.

It is important to us that all not now paid in advance remit and place their credit ahead for a year. Verily every enterprising publisher heartily appreciates his list of promptly paying patrons. We hope our friends will not delay forwarding their postal orders because a single subscription is small in amount. We need the support of every intelligent person interested in the objects to which our paper is devoted. It is the interest of all such that the paper should be well sustained.

We have endeavored in every way to make this journal so valuable to its readers as to render it almost indispensable. No man can read it who will not likely find at least one or more single copies during the year, containing something worth many times the subscription price.

How to Remit to this Office.

ALWAYS GIVE THE NAME OF YOUR POSTOFFICE every time you write to us for any purpose. We cannot find your name on our large lists unless you do. Also write your own name plainly, and the name of the paper you remit for.

THERE ARE FOUR WAYS BY WHICH MONEY, in payment for this paper, can be sent by mail at our risk—by a POSTOFFICE MONEY ORDER, by a REGISTERED LETTER, by a BANK DRAFT or POSTAL NOTE.

MONEY ORDERS CAN BE OBTAINED at the Postoffices of most of the large towns. For the small amount of eight cents you can buy a Money Order upon the San Francisco Postoffice, for the amount you wish to send us, and WE WILL BE RESPONSIBLE for its safe arrival.

REGISTERED LETTERS. If a Money Order Postoffice is not within your reach, ask the Postmaster of your town to register the letter you wish to send us. It costs but ten cents. Then, if the letter is lost or stolen, it can be traced. You can send money in this way AT OUR RISK.

BANK DRAFTS.—A Draft upon any San Francisco, New York, or Washington, D. C., bank, we can use, if it is made payable to the order of the publishers of this paper, San Francisco.

POSTAL NOTES CAN BE OBTAINED for sums less than five dollars at all Postoffice Money Order Offices. For a Postal Note you must pay three cents, and the Postal Note must be inclosed in your letter to us. These Postal Notes are payable to bearer, and therefore ARE NOT SO SAFE AS A MONEY ORDER.

SMALL SUMS of money generally reach us in an ordinary letter, but we cannot be responsible for losses unless you send in one of the four ways mentioned above.

SILVER BY MAIL.—Do not send over 25 cents in silver by mail unless you wrap it carefully, and put an extra three-cent stamp on the letter for every 50 cents in silver it contains. Failure to observe this may cause your letter to get lost.

POSTAGE STAMPS will be received in full payment or for fractional parts of a dollar for subscriptions of the denomination of one and two cents.

Address the PUBLISHERS (and not individuals connected with) this paper, No. 252 Market St., San Francisco.

Land Business at Washington.

Having associated with us able counsel at Washington, we are now prepared to obtain Patents upon Pre-emptions, Homesteads, Mines, Mexican Grants, and all classes of Land Entries; and to manage contests before the Commissioner of the General Land Office and the Secretary of the Interior. Advice will be furnished upon favorable terms. All business will be attended to promptly and on reasonable terms.

DEWEY & CO., Patent Solicitors.

VENTILATED
Rubber Boot
WILL NOT SWEAT THE FEET.
WILL.....
Keep the Feet Warm and Dry.
Warranted to satisfy in all cases. "Have proved the best rubber boot I have ever worn. They do not sweat or tire the feet." Dr. W. L. McCleary, Washington, Pa. Hip Boots sent C. O. D., $6 50.
ALLEN, Agent for Pacific Coast,
116 Market St., San Francisco.

ASSESSMENT NOTICE.
Gould & Curry Silver Mining Company.
ASSESSMENT No. 48.

Levied	June 18
Delinquent	July 11, 1884.
Day of sale	August 4, 1884.
Amount	Fifty cents per share.

ALFRED K. BURROW, Secretary.
OFFICE Room No. 69, Nevada Block, No. 309 Montgomery street, San Francisco, Cal.

SURVEYORS—INVENTORS.
A. SUTRO, Mathematical Instrument and Model Maker, 335 Bush street, S. F. Scientific Apparatus and Experimental Machinery at short notice.

Lost Papers.
If any subscriber fails to receive this paper promptly, after making due inquiries at the Postoffice, he is urgently requested to notify this office by *letter*, that we may send the missing papers, and, if possible, guard against further irregularities.

NINETEENTH
Industrial Exhibition
AND
MECHANICS' FAIR
SAN FRANCISCO, 1884.
Opens August 5th; closes September 6th.
MECHANICAL PROGRESS, INVENTION, ART AND NATURAL PRODUCTS will be represented by the best obtainable exhibits on this coast. An
INSTRUMENTAL CONCERT
By an efficient Orchestra each afternoon and evening.
PREMIUMS.
Medals of Gold, Silver and Bronze, Diplomas and Cash will be awarded as premiums to meritorious exhibits.
ADMISSION.
Double season tickets, $5; single season, $3; apprentice season, $1.50; child's, $1.50; adult single admission, 50 cents; child's, 25 cents; SEASON TICKETS TO MEMBERS OF THE INSTITUTE AT HALF-PRICE.
Any desired information given or sent on application to the Secretary, 31 Post street.
P. B. CORNWALL, President.
J. H. CULVER, Secretary.

WM. BARTLING. HENRY KIMBALL
BARTLING & KIMBALL,
BOOKBINDERS,
Paper Rulers & Blank Book Manufacturers
505 Clay Street, Southwest cor. Sansome,
SAN FRANCISCO.

THE CUMMER ENGINE CO.
CLEVELAND OHIO
SEND FOR 150 PAGE ILLS CAT ALOGUE.

Awarded highest premiums at Cincinnati and Louisville Expositions of 1883, for "Best Automatic Engine." We will furnish anyone copies of the ORIGINAL ENTRIES of several engine builders who claim they were not competing with us. They all entered in the same class with us, and now by deceptive Circulars (one headed "Fact versus Falsehood.") attempt to mislead.
☞ *No premiums were offered for Condensing Engines.*
AUTOMATIC

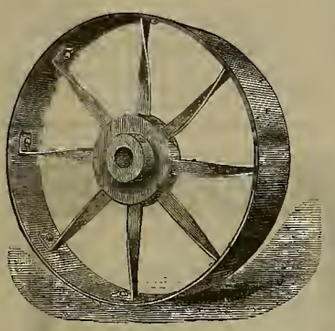
MACBETH'S
—PATENT—
STEEL PULLEY.



Advantages of these Pulleys.

They are less than half the weight of cast-iron pulleys; are polished on the face; are made either crowned or straight, and are turned in the lathe the same as the best make of cast-iron pulleys.

They are carefully balanced. They are subject to no contraction strains, and can be run at very high speed without danger of bursting.

On account of their great lightness and the form of the arms, they absorb less power than any other pulley.

They are *the only pulley of the kind* which runs true. They cannot be broken in transport.

TESTIMONIAL:

MATHER LANE SPINNING CO. (Limited), LEIGH, ENGLAND, Nov. 5, 1883.

N. Macbeth, Esq.— Dear Sir: The Patent Steel Pulleys supplied throughout to our No. 2 Mill are working to our entire satisfaction.

They are very true, and are about 50 per cent lighter than the cast-iron pulleys in our No. 1 mill.

Yours faithfully,
For the Mather Lane Spinning Co. (Limited),
[Signed:] RICHARD T. MARSH, Managing Director.

Economy in space and fuel. Safety at high pressures. Freedom from scaling. Equally adapted for power and heating purposes. Especially adapted for mills, factories, hotels, stores or any place where safety is a necessity. Will work well with muddy water and any kind of fuel.

TESTIMONIALS.

ST. LOUIS, MO., Sept. 28, 1883

Messrs Adolphus Meier & Co. GENTLEMEN: We cheerfully certify that the "*Heine Patent Safety Boiler*" put up by you in our establishment has proved very satisfactory in its working. The chief points of excellence in the "Heine Safety Boiler" are its economy in fuel and space, freedom from scaling, aptitude for power and heating purposes, working equally well with clear and muddy water. We warmly recommend it to all using steam machinery. Yours truly,

ANHEUSER-BUSCH BREWING ASS'N

OFFICE OF SUP'T OF ROYAL RAILWAYS, BERLIN, Sept. 23, 1883.

To Mr. H Heine, Civil Engineer: In reply to your inquiry of September 2d, we respectfully inform you that the three boilers built under your patents, under steam since September 25, 1881, at the Alexander Place Depot, as well as the two at Friedrich Strasse Depot, under steam since September 22, 1882, have given good satisfaction, requiring no repairs whatsoever to date. The internal cleaning of the boiler was always accomplished with ease on account of the convenient arrangement of the tube caps, the adhesion of scales being fully prevented thereby, and the boilers kept in prime condition.

(Signed): BRAUCKE.

WATER JACKET SMELTING FURNACES
—FOR—
Galena Silver & Copper Ores.

The PACIFIC WATER JACKET SMELTERS embrace many features that are entirely new and of great practical utility, which are covered by letters patent.

No other furnaces can compare with these for durability and in capacity for uninterrupted work.

MORE THAN ONE HUNDRED of them are now running on the Pacific Coast, giving results never before obtained as regards continuous running, economy of fuel, grade and quality of bullion produced. We are prepared to demonstrate by facts the claims here made.

These Smelters are shipped in a complete state, requiring no brick or stone work, except that for the crucible, thus saving great expense and loss of time in construction.

Complete smelting plants made to order of any capacity and with all the improvements that experience has suggested as valuable in this class of machinery. Skilled and experienced smelters furnished when desired to superintend construction and running of furnaces. Estimates given upon application. Send for circular.

Work for Boys and Girls.

One of the lately formed institutions in this city, which is doing a good work in aiding boys and girls to earn a livelihood, is the Technical School of the Cigar Manufacturers' Association. For years the work in the local cigar factories has been almost entirely done by Chinese. Trouble between these men and their employers, some time since, caused the latter to take into consideration a plan to teach boys and girls the trade of cigar making, in order that they might be employed instead of Chinese. The Technical School referred to was the result. This school was established only about four months ago, and has already graduated upwards of one hundred young men and women, who are now earning wages and supporting themselves by their labor in the various cigar manufactories of this city. These manufactories could, and cheerfully would, give like employment to five thousand operatives of that character.

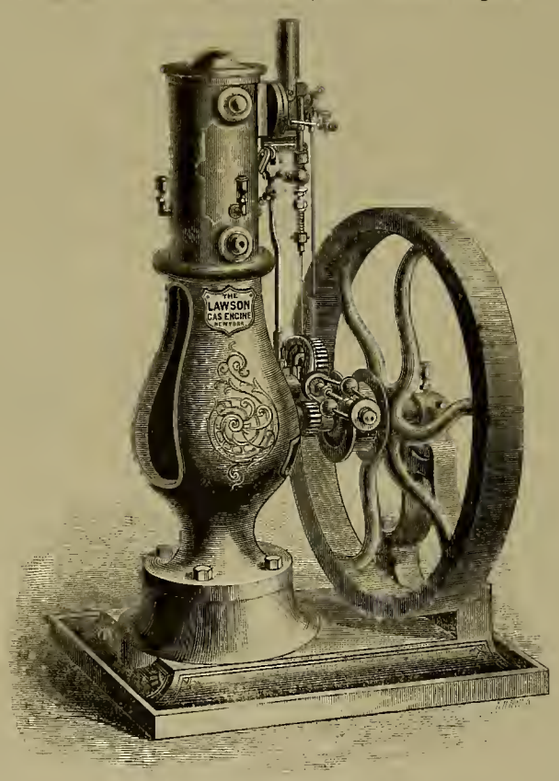
There are always, unfortunately, in large cities, many poor families who have children growing up in idleness, utterly unprepared for any calling in life, and who eventually recruit the hoodlum classes. The ignorance and natural shiftlessness of many of these parents, or possibly their poverty, which requires so close application to their toil in order to earn their daily bread, prevents them from discovering such opportunities for their children as this school presents. It remains for our more public spirited and benevolent citizens to point out to them their duty and privilege to thus inexpensively provide for their children. This school receives white boys and girls of any suitable age, provides them with tools and material to work with, the constant services of skilled teachers, and all without any charge. In about three months' time, with reasonable attention and close application, the student or apprentice has, so far, mastered the rudiments of cigar making as to be competent to earn wages; and our manufactories are open to all such. No charge is made for this training work, the only requirement being the steady application of the student, his or her compliance with the rules of the school, and proper behavior while under its charge. There must be many young men and women in our midst who would gladly avail themselves of such an opportunity, were their attention called to it. The school is at 634 Sacramento street, and the officers are prepared to receive young people who really desire to learn the cigar making trade. It is only to be regretted that schools of similar nature, applying to other branches of trade, are not established and maintained.

SUPPLEMENT.—We publish with this number of the PRESS, a supplement showing the details of the extensive plant of the California Wire Works, one of our most flourishing home industries. The engraving shows the arrangement of the different parts, which is the result of long experience on the part of the engravers. The new works are much more extensive, and a great deal more convenient than those formerly occupied by the company.

THE North Bloomfield Mining Company talk very strongly of working their ground by the drifting process. If they do this it will be on a big scale. It is also stated that an extensive hydraulic mine at Cherokee will be operated in the same manner. People along the ridge are anxiously waiting for the work to begin.

The Lawson Gas Engine.

The engraving on this page represents the Lawson Gas Pumping Engine, which is just being introduced on this coast by Mr. E. A. Rix, 18 Fremont street. Mr. Rix, while East a short time since, examined several gas engines, and found that the Lawson was in high favor, and was in use in many places. People who had had it in use with other types were adopting it entirely, so he secured the agency for the Pacific Coast. Mr. Rix assures us that the engine costs only five cents an hour for one-horse power; and eight cents an hour for two-horse power, making it an efficient and cheap motion. The engine is compact in form and neat in appearance.



THE LAWSON GAS ENGINE.

This engine has been especially designed to supply a want for a thoroughly reliable, practical and economical method of raising water for French flats, hotels, hydraulic elevators, private residences, and extinguishing fires. The firm some ten years since, were the first to introduce pumping engines for private residences, etc., and their experience has demonstrated that the use of gas as fuel, took altogether too much time, either to make steam, or the requisite heat for hot-air engines; consequently was decidedly too expensive.

In hot-air engines, in which coal is used, they do fair work; the noise from them is a great objection, and the liability of burning out the packings and fire-pots, and warping of the cylinders, makes the question of repairs such a serious matter as would deter those familiar with them from purchasing.

In the Lawson gas engines, in which the gas is exploded in the cylinder, these objectionable features have been obviated. It will pump more than double the quantity of water, for gas consumed by any hot air engine; is made entirely of metal; has no packing to burn or blow out; can be started instantly by simply applying a match, and will pump between 200 and 300 gallons of water before other engines are ready to work.

The engine has few working parts, is positive in its action, and requires little attention or cleaning. Of course all smoke and ashes are done away with, and there is no boiler, steam, fire, extra insurance or engineer. One of these machines will be exhibited at work in the Mechanics' Fair.

A DRILLING MATCH.—The Virginia (Nev.) *Chronicle* states that a novel drilling match between James Flannery and John Hickey, two miners of Gold Hill, took place the other evening on the road near the Crown Point mine. The match was for $50 a side, and the wager was for the purpose of ascertaining who could drill two feet into solid rock in the shortest time. A large crowd of spectators assembled to see the match. The rock was the hardest surface material that could be found. Each contestant had his helper to turn the drill, which was struck with a heavy hammer. Flannery broke six drills by the tremendous force of his blows, but won the match by two and a half minutes. Time: Flannery, 40 minutes; Hickey, 42½. The decision of the referee seemed to be unsatisfactory to a majority of the crowd, who insisted that the match was a tie.

SACRAMENTO county's gold mines, in the vicinity of Folsom, are said to yield between $4,000 and $6,000 per year.

Silica Percentage of Slags.

It is taught in the mining schools that in smelting lead ores the object is to make a singulo-silicate slag, or one between this and a bi-silicate, of the earthy matter in the lead ore, which best enables us to effect its separation from the metallic matter. It is also taught that single singulo-silicates are not as easily fusible as compounds of two or more singulo-silicates: for instance, a compound of the singulo-silicats of ferrous oxide with that of calcic oxide. It was further known in practice for a long time that if, in fluxing an ore, the proportion of lime to oxide of iron is kept as one part of the former to two parts of the latter, a good slag would result; that is, one which will form with the least amount of fuel. Keep the furnace open, and be free from lead and silver. But with all this knowledge, more bad slags than good ones were made, until several thinkers were led to the right track by giving their attention to crystallized slags, which, presumably, are real chemical compounds, and therefore have a constant composition, while amorphous slags might be considered as mere mixtures of different silicates or solutions of one silicate in another.

It was observed that some crystallized slags behaved better than others in a furnace. If such a slag, then, could be made at will, a great problem was solved; any kind of ore could be smelted without the least trouble by giving it the lacking constituents in the same ratio as they are found in the analyzed slag. This necessitates, of course, an accurate knowledge of the slag-constituting ingredients of ore, fluxes and ash of the fuel, which can only be arrived at by chemical analysis and an accurate weighing of all the material in the furnace. Taking all these procautions, a slag of the same crystallization as the typical one will almost invariably result, other things being equal. The expression almost universally is used because Mr. O. H. Hahn, a gentleman of great practical knowledge on this subject, had the experience in Colorado that oxide of zinc seems to prevent crystallization. Mr. Hahn states that the slag-forming matter of an ore which has to be most frequently dealt with in lead smelting consists of the following substances: silica, alumina, the oxides of iron and manganese, lime and magnesia. Barytes and strontia are of rarer occurrence, and the oxides of the alkaline metals exist only in such subordinate quantities that they may be neglected.

All the above-named substances are hardly ever found present in the same gangue, and much less arranged in such a proportion as to yield at once a suitable slag in smelting. By supplying the ore with the deficient ingredients, we *flux* it and form a "smelting mixture." According to the amount of combined silica present in a slag we distinguish three degrees of acidity:

1. Subsilicates, in which the oxide of the bases is to the oxygen of the acid as 2:1 – or, $4RO + SiO_2 = R_4SiO_6$; or $R_2O_3 + SiO_2 = R_2SiO_5$.

2. Singulo-silicate, in which the oxygen of the bases is to the oxygen of the acid as 1:1 – as $2RO + SiO_2 = R_2SiO_4$; or $2R_2O_3 + 3SiO_2 = R_4Si_3O_{12}$.

3. Bisilicate, in which the oxygen of the bases is to the oxygen of the acid as 1:2 – as $RO + SiO_2 = RSiO_3$; or $R_2O_3 + 3SiO_2 = R_2Si_3O_9$.

CORRESPONDENCE.

We admit, unendorsed, opinions of correspondents.—EDS.

The Blind Miner's Geological Discoveries.

EDITORS PRESS:—Leaving gravel mining out of the question altogether, one of the most important questions for this State to understand, physical geology would be of the greatest interest to the world at large. Our ancient drainage system could almost as accurately be mapped out as the modern, over all the world, wherever the interest of the country demanded it. It is laughable to hear correspondents talk about reading geology as plain as print, and then in the next sentence glaringly expose utter ignorance of the whole question. It is all true; it can be read as plain as print, but not by men that can't spell *baker*. There are none so dumb as those who don't want to understand. It is provoking to be treated with the kind of contempt that I am because I think differently from other people. I have always been willing to answer any fair question that I could on this subject: but how have I been met and treated?

There is not a business man in Grass Valley that is sure that he is treating me right by not lending me the least aid to help me through with my hard task; seeing me suffer against odds that no other man would attempt. But I am a philosopher, and I can get along on a thousand or take care of a million, according to my notion; but let me tap pay gravel, and then they will pay me for what I do.

It is business I want, and $500 now would be better than $5,000 the day after I strike pay. I want rest from my anxiety and hardships, and I will have it. I will settle down and be content with just what I can take out myself, and as soon as I can just make myself comfortable, I shall close my mine and not worry myself to benefit other people one dollar. I would rather have a million dollars in my mine that I can take out when I need it, and as I need it, than have the same amount out, where it would be exposed to the games of rascals and journeymen scoundrels that would forever be playing some game I was not looking for. So you see, as I can have the pile to go to, as long as I have sense enough to keep it to myself there will not be much inducement to sell out my chances at any price.

If I had had my sight, and known what kind of men I had to deal with, and not been compelled by poverty and blind helplessness, I would have been a jackass if I had ever whispered what I have discovered. Even as it is, I have been cursed by making it known that I had discovered anything. I would have had far better success if I had pretended to be a *wizard* or *hypocrite* of some sort, and went for the fool side of man, than to have appealed to his good sense. The more I tell him that it is a discovery that other men can understand and practice, the bigger fool he makes of himself and the meaner he acts, and demands at once to be enlightened without the least expense to himself. They suppose that a man can spend his whole life in hard study and labor to work out one of the hardest and one of the most important problems to the public at large and science ever worked out by any man, and then give it away for nothing. H. CLENDENEN.

Randolph Flat, July 20, 1884.

Where Emery Comes From.

As no inconsiderable part of the annual product of the emery mines of this province, writes the United States Consul at Smyrna, is exported to the United States, as it is the sixth article in point of value thus exported, some facts bearing upon this production may not come amiss. For many years one or two parties holding concessions from the Government maintained a virtual monopoly of the emery mining industry, and kept prices accordingly, the rough stone being sold at the rate of £16 sterling per ton. To-day, £5 sterling per ton is an average price. How much of this falling off in price is due to competition, deterioration, or decrease of consumption, can only be estimated. The mines are worked either under "firmans" or concessions, obtained from the Government only with difficulty and large expense, or through contracts made with the "estates of the Church Ottoman," known as "vacouf." In the latter category are the mines of "Gumnah Dagh," near Sokia, and about four hours distant from the station of Azizie, on the line of the Ottoman railway, which station is about seven miles from Ephesus. These mines pay to the "vacouf" a royalty of so much per ton on all the ore extracted, which is transported on mules and donkeys to the station at Azizie, and taken thence to Smyrna by rail. The road from the mines to the station being very rough and over mountains, camels cannot be employed, a serious drawback, inasmuch as the carrying capacity of a mule is only equal to about one-ninth of a ton. The quantity of emery yet unmined in these quarries of the Gumnah Dagh is large, but the quality is below the standard. The Thyra mines, known as the Aliogoli, are located on a range of hills between Cosbunar and Thyra, within four and one-half hours by camel from Cosbunar to station on Ottoman railway, forty miles from Smyrna. They are operated by several parties under concessions from the Turkish Government, for a term of ninety-nine years. Formerly large quantities of excellent emery were taken out, but of late years it has become difficult to extract the ore, which is conveyed on the backs of donkeys to the plain. At the foot of this range of hills is the Coursak mine, a large, irregular bed of emery, not a lode, mixed with earth. It is easy of extraction, no powder being required, but is covered with from fifteen to twenty-five feet of silt, the accumulation of ages. Much of this inferior quality of stone finds a market in Germany and the United States. In all emery deposits there is a risk of a sudden exhanstion of the ore. This fact, taken in connection with the difficulty of procuring concessions, the peculiarities of Turkish laws, and the export duty of 20 per cent, calculated at the selling price in Europe, does not encourage enterprise in the direction of opening up new mines, or deepening old ones, although experience proves that the best emery comes from the greatest depths.

Failure of the Mine Indicator.

As might have been expected, the trial of the mine indicator in Nevada county proved it to be a fizzle. The Nevada *Tri-Weekly Herald*, of July 22d, says:

Over a hundred persons went out from town yesterday forenoon to witness a test of the mineral indicator that Dr. E. B. Lightbill, lately of New York, is endeavoring to introduce to the people of Nevada county. The test, or more properly tests, were made at the old Williams ranch, on Peck's ravine, not far from the Providence mine. We did not witness any of the experiments, but sent a reporter, whose opinion of the working of the machine is given elsewhere. The general opinion of those who were present while the tests were being made is that the indicator is a signal failure and a "hoodoo" of the worst kind. It would have pleased us very much had the indicator accomplished one-half what was claimed for it; but, from all accounts, it did not give the slightest demonstration that would argue in favor of its practicability. The manner of its introduction here convinced us that the apparatus would prove a failure. If the inventor and owners had full faith in the indicator they would have been apt to quietly buy up a few mining locations for themselves before giving a public exhibition of the machine by which it is claimed the whereabouts and richness of ore deposits can be determined. It is quite natural for the people of Nevada county to be skeptical regarding such matters. They have been fooled several times by mine indicators and new processes. The gigantic humbug known as the Fryer process has not yet been forgotten. Everybody hopes, and many believe, that the day will come when the exact location, extent and value of ledges can be determined from the surface by instruments, and when rebellious ores will be profitably worked. That day has not yet arrived.

A correspondent of the same paper gives further information on the subject as follows: In company with many of the scientific miners of this city, your correspondent visited the scene of the experiments which were yesterday made by Dr. Lightbill with what he calls a mine indicator. It is claimed that all mineral veins carry an electrical current, and that such current will communicate itself to the indicator and be demonstrated by the action of a galvanometer. We have not given the matter that attention which would warrant us in saying that the first of these propositions are true, but in our opinion, even if it is, nothing was demonstrated yesterday to prove either the first or the last. The experiments made were not of such a nature as would demonstrate the presence or absence of a mineral vein. Two bars of steel are driven into the ground about eight inches apart. These are connected to the poles of a battery and the endeavor was supposed to be made to take the current from the earth and indicate it by the needle. To our mind this was not done in any of yesterday's experiments. We came to the conclusion that the current passed from one of the electropodes to the other through the earth, and particularly so when they were placed in the wet soil, as the most rapid indications were made in the bed of the stream where there was plenty of water, which is a good conductor. On the contrary, when they were driven in the croppings of the Providence ledge, no indications whatever were received.

As we said, these experiments proved nothing as to whether there is a current in a vein, or as to whether that current could be successfully indicated by a machine. The wonders of electricity are but just beginning to be appreciated and every man who spends his time in experimenting is in danger of discovering something new. We believe in encouraging experiments in electricity to the fullest extent. It is a science in which men are groping in the dark and one of experiment. Some occasionally discover a new wonder in connection with it, and stranger things have already been shown than that a certain amount of it exists in a quartz vein which can be demonstrated by a machine. It is, though, we believe, one of the things which is yet to be discovered, and we would not like to rely on such experiments as were made yesterday if we desired to invest our money in mining. We should as yet prefer a stout, practical miner, with a pick and shovel, if we wanted to hunt for a quartz vein.

Tamping Drill-holes with Plaster of Paris.

The following paper was read before the American Institute of Mining Engineers, by Frank Firmstone, Easton, Pa.:

In the summer of 1881 we were forced to break up and remove the large mass of iron which had accumulated under No. 2 furnace at Glendon, in order to prepare the foundations of the new furnace which has taken its place.

We used "Atlas" powder, drilling the holes with a pair of Rand drills. These worked very well when the iron was at all uniform in hardness; but this was not often the case, and it frequently happened that the holes were hopelessly blocked when but little over a foot deep. Good tamping became, therefore, very important.

Tamping in the ordinary way holes having percussion caps in them is very dangerous, and has, no doubt, caused many of the accidents attributed directly to high explosives. We found an excellent and safe method by using plaster of Paris, mixed to the proper consistency and poured into the holes as soon as they were loaded. Clean dry sand was mixed with the plaster to reduce the quantity needed.

With proper attention the tamping would set in a few minutes, and little or more time was required than for tamping in the ordinary way.

We used a "magneto" machine (Laflin and Rand) to fire the holes; and an additional advantage in the plan was that at any risk of cutting the exploder-wires in tamping was avoided.

We found it worth while to load not over 13 inches deep in a block 3 or four feet thick, since the bottom of the hole was enlarged by each shot so that the next time it could be loaded more heavily, and three or four shots in this way often did as much good as a new hole twice the depth, to drill which might have taken ten or twelve hours.

The rise in temperature when boiled plaster solidifies is not sufficient to ignite the exploders, as we found by repeated trials before using it in a loaded hole.

Discussion.

S. Whinery, Meridian, Miss.: During the summer of 1878, while engaged on the improvement of the Tennessee river at Muscle Shoals, Ala., under Major W. R. King, U. S. Engineer, I had occasion to blast a large amount of limestone rock from the channel of the river. The surface of this rock was from one to three feet below the surface of the water, and the drill-holes were from one to three feet deep. The depth of water not being sufficient to make water-tamping entirely satisfactory, I experimented with several methods and substances for tamping under water. Among these, plaster of Paris was pretty thoroughly tried. When the charge of dynamite, with the platinum fuse, was in place at the bottom of the drill-hole, plaster of Paris, mixed quickly with sufficient water to make a rather thin mortar, was run into the drill-hole by means of a funnel and tin tube, the lower end of which was placed directly over the top of the drill-hole. The charge was allowed to stand 20 to 30 minutes for the plaster to set, when it was fired in the usual way by a dynamo-machine. This tamping gave very satisfactory results; but it was found difficult to have the plaster used properly and intelligently by the class of laborers employed, and the plaster would adhere and harden on the inside of the tube so as to fill and obstruct it in a short time. The advantage gained by this close and hard tamping, over the water-tamping, was not found to be sufficient to justify its use under the disadvantages named above, and it was discontinued. Where several hundred holes were to be drilled, charged and fired each day, in sets of from fifteen to twenty each, and any delay in charging and firing seriously delayed the whole work, the saving time, when the charge was simply sunk to the bottom of the hole, the wires connected, and the charge fired, was more than enough to compensate for the defective water tamping.

Dr. R. W. Raymond, N. Y. City: I would call attention in this connection to the fact that, although the rise in temperature in plaster of Paris he not sufficient to explode any of our highest explosives, there is an element of danger perhaps not peculiar to the use of this substance; and yet, in proportion as it is a perfect tamping, in that proportion this element of danger is present. It is not safe to leave any of the high explosives (at least those which are compounds of nitroglycerine), after tamping for any considerable period of time in such a confined position. A rise in temperature, which may not be enough of itself to cause explosion within a reasonable period, is often enough to set a generation of gas going which will bring the pressure, which will cause explosion. The thing to be done after tamping is to fire at once. My attention was called to this in the early days of the use of a nitroglycerine powder on the Pacific coast: I think the case is mentioned in my first report (1869) as United States Mining Commissioner. As I recollect it, a hole had been tamped in the mine just about the time to go to dinner, and the men having gone to dinner, leaving the hole with the exploder in it, but not lighted. It went off during their absence of itself, injuring nobody, but surprising them a good deal. They had the idea that dynamite was as safe as brown sugar, and among the miners the belief was, that in order to be safe, one had only to be careless with it, and leave it lying around loose. There was some truth in that maxim; but when you come to bottle it up, to pack it in a drill hole, and put tamping on top of it, it is then the elements of danger are present, and it is simply wise to fire it as soon as you possibly can.

At the same mine, where I examined it with some curiosity, they had a box of cartridges, which they had brought and unloaded at the mouth of the tunnel leading into the mine, and to which the men went and fished out a cartridge as they wanted it. This box lay for some hours, the first day after its arrival, under the rays of a California sun. Well, all that happened was, that slowly the lid of the box rose right up. Without question there was a generation of gases going on at the comparatively low temperature caused inside a wooden box by the sun outside—a generation of gases—which lifted the lid and relieved the pressure, so that there was no explosion. But rigid tamping of a drill-hole would make trouble I think if it should be abandoned too long.

William Kent, Jersey City, N. J.: I would suggest that, just before the tamping with plaster of Paris, some compressible substance be inserted, with the double object of preventing the conduction of heat and of making a compressible cushion, against which the gases could work, instead of confining them in a solid, close receptacle.

Dr. Raymond: I am inclined to think that that expedient would rather weaken the effect of the high explosive in particular cases, like the one cited in this paper, when it is designed to burst asunder salamanders of iron. In that case I suppose that any compressible substance making a cushion would enable the charge to lift more and lose tearing power, because there would be a yielding at the instant of the first impulse, before it came to act directly upon the rigid inclosure. I have no doubt that such a cushion would have the desired effect where tearing was not so much required as lifting, assimilating the effect of the explosion to that of gunpowder. I have no doubt that a safety-pad would be effective in counteracting the dangerous results of the generation of gases, and perhaps even increasing the force of powder; but at the same time I doubt whether it would do as good work in actually shattering solid rock.

William Kent: The space occupied by the gases generated before the explosion is so small (being but a few cubic inches to several thousand times as much), compared with the whole volume of the gases after the explosion, that I think the effect in lessening the force of the explosion would be imperceptible.

W. S. Ayers, Allamuchy, N. J.: I have found in limestone that a cushion did effect the tearing power of the powder; that the explosion did not shatter the stone as thoroughly as it did when the cushion was not used.

THE WEATHERING OF THE ROCKS.—A grand exhibition of one of the leveling processes of inanimate nature was witnessed in the vicinity of the Homer group of mines, south wall of upper Mill Creek Canyon, on Friday afternoon of last week. Jasper Parrett, who is doing some work on the Homer group, was climbing the wall by the Homer trail, and had just emerged from the narrow gorge through which the trail passes, about 1,700 feet up from the creek, when a great obtruding dyke of greenstone dropped from a heetling cliff nearly 2,000 feet above him, broke into huge blocks and come leaping and thundering down the nearly vertical declivity toward him. Mr. Parrett had barely time to escape over a field of compact snow clinging to the steep mountain side, and had the slide taken place while he was climbing through the steep and narrow gorge just below he must inevitably have been killed, as the flying mass raked both walls from end to end of the gorge. Some of the blocks, leaping several hundred feet down the mountain at a single jump, would strike upon a hard snow bank and hurl clouds of snow hundreds of feet into the air, and one block which weighed perhaps not less than one hundred tons, ran clear down into Mill Creek, a distance of about 5000 feet or nearly one mile.—*Homer Mining Index.*

METALS AND MINERALS.—The Carson *Index* says: The mineral surroundings of Mason and Smith's valleys are noticeable to every traveler. The hills and mountains are evidently more or less mineralized everywhere. No portions of Nevada more thoroughly present the united agricultural and mining resources of the State than are to be found in those regions. In the more barren portions of the plains, salt, borax and soda and alkaline earths predominate, and many an industry awaits the judicious application of labor and moderate capital. In the mountains there are metals, including copper, silver, gold, iron, nickel and galena. Right at hand are the great areas of rich soil with an average abundance of water for irrigation, which will furnish all the products for the sustenance of man and beast. The face of nature will in due time be retrieved of its native aridity and forbidding features by the teeming population that will drive the appliances of the farm and the mine. When this happy time arrives, the valleys of Nevada will be as prosperous as any upon the globe.

LAST year the Anaconda mine, at Butte, M. T., sold nearly $2,000,000 worth of copper, and will largely exceed that amount this year.

MECHANICAL PROGRESS.

Advantages and Success of the Gjers Soaking Pit.

At the May meeting of the Mining Engineers at Chicago, Mr. John Gjers, of Middlesboro, Eng., read a very interesting paper in relation to his now well known "Soaking-pit" process, an invention already fully described and often referred to in these columns.

Mr. Gjers characterized his invention as the missing link in the chain of metallurgical operations which began with Sir Henry Bessemer in 1857. Bessemer showed how it was possible to produce steel from the fluid cast iron without further direct heat. He stopped at the ingot. The soaking-pit dispensed with "puddling," and by the union of the two processes a rail is produced from the fluid cast iron without any application of external heat. In this country, where the general practice is to first roll the ingots into blooms 7 or 8 inches square, which are cut, heated and rolled into single length rails, the soaking-pit would only supersede the first heating, or that for rolling the ingots into blooms. If the heat in an ingot brought in a furnace to the temperature necessary to rolling be represented by 100, the heat in the fluid steel is 150; so that the steel can loose one-third of its heat in the ingot mold and sufficient remain for rolling purposes. One important distinction between furnace-heated ingots and those from the soaking-pit is that, whatever the surface heat of the latter may be, it is always hotter inside. The reverse is true of the former. The pits, with proper care, can be kept hot for ten days without difficulty when stoppages are necessary.

In addition to the saving of coal and labor in the use of the pits, there is quite a saving in the loss of steel. The loss of steel by absolute waste in the heating furnace varies in different works, but the loss in the first heating is seldom less than 2½ per cent in the ingot after it has left the blooming rolls, and 1½ in waste heating. Numerous experiments show that the loss from the ingot to blooms in the pits is ½ per cent, or a saving of 2 per cent. This may not hold true in this country, where the ingots are quite large, but the saving will be an important one. This saving is due to the fact that the ingot, while in the pit, is entirely excluded from the action of free oxygen. Not only do the covers exclude the air, but considerable gas exudes from the steel, and filling the pits, completely protects the ingot. This gas is composed entirely of hydrogen, nitrogen and carbonic acid, so that the ingots soak in a perfectly non-oxidizing atmosphere. The loss in rolling rails direct for ingots from the soaking pit is less than 1 per cent. The process has long since passed the experimental stage and is now in continuous operation in four Bessemer works in England, two of which roll off direct without any furnacing whatever. It is also about to be started in the largest open-hearth works in Scotland. It has also been in operation for some months at two large Bessemer steel works on the Continent of Europe, and is about to be started at another, as well as at an open-hearth plant.

Mr. Gjers states that at small open-hearth plants the process cannot be used to its full extent, but in a modified method it is still applicable to these also.

The paper was discussed by Dr. Raymond, Durfee, Kent, and others, which brought out several interesting facts. In case free oxygen should be present in the pits a lump of ore the size of a walnut or a small piece of wood was thrown in. The pits had been lined with steel and iron to prevent abrasion, but these linings were apt to buckle and the pits do not get quite so hot. Mr. Gjers proposed the fire-brick pits. If these were fitted with fire clay there was not much difficulty from abrasion. Pits have been continuously at work for 12 months.

Steel Plates by the Centrifugal Mode of Casting.

The English correspondent of the *American Manufacturer*, says that steel makers in England are just now paying some attention to what is going on at Leeds at a work there recently erected by Mr. Jos. Whitley. They have been built for the purpose of manufacturing, by what the inventor terms a wholly new centrifugal method, steel plates for shipbuilding steam boilers, etc. The method of procedure is briefly described as follows:

A hollow metal cylinder, lined with gannister or other brick, revolves at high speed, the axis being horizontal. A gutter or rhone, perforated with holes, passes into the interior along its whole depth. Into this gutter is poured melted mild steel, which, escaping through the holes, is carried round by the swiftly revolving case, and centrifugally is formed into an inner cylinder of steel about an inch or more in thickness. This cylinder, while still hot, is drawn out, cut across by a saw, put into a rolling mill and rolled to the length and thickness required.

Mr. Whitley, describing his own invention, says: Suppose I wish a plate for ship building; then, say, given a mold five feet in diameter, and five long; in it I cast a cylinder an inch thick. This when taken out and cut, is fully 15 feet long and five feet broad. It is then rolled down to half an inch of thickness. Such a plate is then 30 feet long and five feet broad, for we can arrange that the displacement of the thickness shall be chiefly endwise. The present mold is nine feet long, and five feet in diameter. With it I recently successfully cast a mild steel shell—weight of mold about 30 cwt. Continuing, Mr. Whitley puts it, this makes the long-looked for, but now no longer doubtful fact, an historic fact in metallurgical science.

Hitherto these plates have been made from large ingots, which have been burnt on the outside while getting heated to the center. It is the over-heated portion that gives way in collisions, boiler burstings, etc. In my process, continues the inventor, the whole plate is homogeneous throughout, and the tensile strength is so much increased that when ships collide there is no rending or fracture; and though the hilge is made to collapse, the ship, still floating, can sail into port to get re-bilged—recontoured.

Of course, tubes of smaller size can be manufactured centrifugally, and these are especially suitable for connections about steam boilers, where in lap welded tubes breakage is apt to take place at the overlap.

New and Useful Alloys.

It appears that the new alloy, known as "silveroid" is fast coming into practical use in Europe. It is being used for many purposes as a substitute for German silver. The distinctive qualities of the metal are that it is produced whiter, closer grained, capable of a higher polish, more suitable for casting purposes, and lower in price than any other alloy. It is also less disposed to tarnish, and is easily workable for all art castings and other purposes. It is much cheaper than German silver, besides being decidedly superior. For bicycle fittings and metallic ornamentation, generally, it is found especially applicable. It is used for railway and some other door handles, steam fittings and tubes; it is also taking the place of electro-plated work, as for knives, spoons, etc. The advantage claimed for it over the electroed goods is that the metal is cast solid and can be always kept in a highly polished state, whilst as an alloy it is more ductile than German silver. Screws are now being made of silveroid for use where there is exposure to corrosion.

Delta metal, composed of copper, zinc and iron, is also fast coming into use. It is claimed for this new alloy that repeated experiments have proved it to be equal in strength, ductility and toughness to mild steel. For sea-going purposes delta metal promises to be especially valuable as a substitution for steel plates in craft designed for the navigation of the waters of the African rivers which have the power of corroding and of eating through steel plates very rapidly. To test its value in this direction a London firm has constructed a steam launch of this alloy. The plates and angle pieces used are of the same dimensions as when steel is used. The launch is now one of the sights of the current exhibition at the Crystal Palace. Her length over all is 36 feet.

A NEW MECHANICAL PUDDLING FURNACE is claimed as one of the late achievements of English invention. The English correspondent of the *American Manufacturer* speaks of it as an improvement of Cort's puddling furnace, and a device for making the puddler (or boiler) no longer the drudge who handles the rabble bit, but the gentleman who watches automatically working machinery do all the labor required to turn crude iron into malleable iron, or into steely iron. It is more pretentious than the Dank furnace, says the above correspondent, since it proposes to ball-up as well as to boil. But whether it is likely to be attended with more success than that device is questionable. If it could be run as the inventor ventures to hope, then it would be a considerable improvement upon the Danks, since it would not only do more of the manual work, but would do it with a continuance scarcely contemplated by Danks; without, however, one would think, the capability of the Danks to treat heavy charges; though a series of rapidly perfect balls ought to be really heaten by the shingling hammer into massive blooms. But the device has not yet gone beyond the stage of models and plans.

HOW TO DETERMINE EXPANSION.—Mr. C. E. Emery made a very complete series of experiments some years ago upon the engines of the United States revenue cutters Rush, Dexter, Dallas, and Gallatin, from which he deduced the following simple rule (subject to certain limitation) for the best ratio of expansion in steam engines: Rule—Add 37 to the steam pressure as shown by the guage; divide the sum by 22; the quotient will he the proper ratio of expansion. Example: An engine is running with a pressure of 90 pounds per square inch; what would be the ratio of expansion? $90 + 37 = 127 \div 22 = 5.77$ = the best ratio of expansion.

IRON AND STEEL DIRECT FROM THE ORE.—There is said to be a fair prospect that Bull's direct process for the manufacturing iron and steel direct from the ore will soon be introduced into the Tees district, England. The direct production of iron and steel from the ore has long been one of the dreams of the Northern ironmasters, and some believe that by Bull's process they can effect it cheaply—even cheaper than pig iron can be produced under the present systems. This cheapness is claimed to be produced by the great increase in the yield of the furnaces, and the reduced consumption of fuel.

SCIENTIFIC PROGRESS.

The Zodiacal Light.

In the current volume of the Proceedings of the American Academy, Mr. Arthur Searle publishes an elaborate and exhaustive production of all the accessible observations of the zodiacal light, a phenomenon which is as yet but very imperfectly understood. The paper gives the position of the axis of the cone, and the apparent boundaries of the light, as determined by nearly 650 different observations by Jones, Heis, Lewis and others. The tables appended give monthly means and other data which summarize the results in a very complete manner.

Mr. Searle does not indulge in much theoretical discussion as to the nature of the zodiacal light, but he points out that the apparent slight deviation of the axis of the cone from the ecliptic is most probably due to the effect of atmospheric absorption, and calls attention to the necessity of more refined methods of observation. He says: "If atmospheric absorption has the importance here assigned to it in the study of the zodiacal light, we cannot expect to determine the true position of the light on any occasion by the simple methods heretofore in use. We must either discover exactly what an observer means by the boundary, and to what extent this boundary will be displaced by given changes of brightness, or we must resort to direct photometric observations. The last course will probably be preferable."

His only remark as to the theoretical explanation of the zodiacal light is the following: "I have merely to remark, with regard to the ordinary meteoric theory, that it gains greatly in simplicity if we dispense with all the imaginary meteoric bodies, or rings, with which it has usually been connected, and retain merely the conception of meteoric dust diffused throughout the solar system. It may be shown mathematically, if we regard the meteoric particles as solids reflecting light irregularly, that an appearance like the zodiacal cone, with an indefinite vertex, would result. On this subject the work of Geelmuyden may be consulted."

In regard to the last paragraph, *Science* comments as follows: We suppose that by "diffused throughout the solar system" he means diffused mainly in the plane of the ecliptic. Indeed, it could be shown that if we started with an indiscriminate spherical distribution of meteoric dust around the sun, the disturbing action of the planets would ultimately convert it into an approximately discoidal distribution in a plane coincident with the mean plane of their orbits. At any rate, it is not easy to see how an indiscriminate distribution should lead to anything but a glow-cone with a *vertical* axis.

ELEVATED OBSERVATORIES.—Some idea may be formed, which may be expected from the Lick Observatory, when all the instruments designed for that locality are in position from the following: "A new observatory has recently been established on a high mountain, in the south of France, known as Pic de Midi. Here Mr. Thollon has erected his most powerful spectroscope, and reports that he can see daily, forty rays of the chromosphere, in a region where ordinarily only eight are visible. He also makes the new and interesting observation that the granulations of the photosphere are visible in his spectroscope as fine strie extending through the whole length of the spectrum. What is yet more curious, similar granulations seem to show themselves in the chromosphere, being indicated by the character of the hydrogen lines, which are broken up into small pieces, instead of being continuous. It may be remarked, in this connection, that this observatory is not a purely governmental one, but has been constructed with the funds donated by various private individuals and scientific bodies of France." With improved instruments, equal elevation, and the much clearer atmosphere of California, still further new and still more interesting observatories may be expected from Mount Hamilton than has been or ever will be reported from Pic de Midi.

PHOTOGRAPHY IN ASTRONOMY.—Mr. Lockyer presents some striking ideas respecting the future of physical observations of the heavenly bodies. He suggests that it is now time to abolish the observer entirely, and that any astronomer would be losing his time by attempting to draw either the nebula of Orion or the spectra of stars. Photography should take the place of hand-drawing for both of these purposes. He pictures an astronomer, one thousand years hence, in a room filled with photographs, giving a picture of every part of the heavens, from pole to pole, as it appears to us in the nineteenth century. By using a different form of telescope, the expense of a dome could be avoided. Mr. Lockyer's suggestions are well worth the attention of those engaged in astronomical researches, or in planning observations therefor.

BIOLOGICAL RESEARCHES.—Professor Carnoy, of the Catholic University of Bouvain, announces a work on "Biologie cellulaire," which will treat of the general characters of cells, both animal and vegetable. He proposes to deal with the general organization, chemistry, and physiology of cells, basing his work upon original observations, either new, or confirmatory of previous researches. He promises over four hundred new illustrations, engraved with great care and accuracy. The scheme is ambitious; but, if well carried out, it will secure us a valuable book on an aspect of biology too little heeded at present. Professor Carnoy is a botanist, whose reputation will rise high if his volume fulfills the promises of the prospectus, says *Science*.

THE SALMON YIELD.—Mr. Huxley's report of last year's salmon fishing confirms his own assertion that very little is known about the influences which regulate salmon supply. The take of salmon and sea-trout has increased and diminished in defiance of all theories, and Mr. Huxley is equally unable to establish any consistent relation between the take of salmon and the proportion of grilse present in succeeding years, a large take being sometimes followed by scarcity, and sometimes by abundance of grilse. Mr. Huxley's sympathy with manufacturers has grown with his experience, and while he acknowledges the importance of the rivers, his confidence in the power of legislation has diminished with experience, but he still insists on the necessity of it. The two points brought out by the continued experiments of Mr. George Murray, of the British Museum, are that the fungus may attack fish with whole skins, and otherwise perfectly healthy, and that an excess of lime in the water is not a predisposing cause of the disease.

TEMPERATURE OF THE SPHEROIDAL STATE.—Prof. Louis Bell, of Dartmouth College, communicates to *Science* the particulars of some experiments which he has recently made to determine the temperature of the spheroidal state of liquids. The experiments were very carefully conducted and were simple in manner. The spheroids of the liquids experimented upon were produced in a spoon heated over a spirit lamp. A large number of experiments were made, the average variation of which did not exceed 1°. The size of the spheroids had no effect upon the temperature. The temperature thus found was: for water, 90°, and for alcohol 69°. We are not aware that any effort had previously been made to determine such temperature. The result of Prof. Bell's experiments show a much lower temperature than has hitherto been assigned to the spheroidal state, and they are both interesting and important.

INTERESTING PHOTOGRAPHIC DISCOVERY.—A German Scientific *Journal* reports an interesting and important discovery in photography. Eleven years ago, Professor Vogel, of Berlin, explained a method by which the effects of color, such as blue and yellow, might remain unchanged as to light and shade, and which might overcome this difficulty in photography. He has now worked out a process on this principle with practical success; it is published in the *Photographischen mittheilungen*, and the German Photographic Society has awarded him a prize for it.

THE SOURCE OF ELECTRICITY.—Physicists have lately been trying to determine by experiment whether the electricity of thunder-storms is generated by the evaporation of water or by the condensation of vapor. Freeman and Blake have each obtained results which indicate that no electricity is produced by the evaporation of pure water. S. Kalischer has since made some investigations with delicate apparatus, which have failed to show that condensation or the formation of hail is a source of atmospheric electricity.

THE LIGHT OF THE MILKY WAY.—Mr. Arthur Searle, in the course of his investigations into the phenomena connected with the zodiacal light, elsewhere referred to in these columns, has demonstrated the interesting fact that the Milky Way is about two magnitudes brighter than the mean brightness of the sky; which would mean, of course, that a square degree of the Milky Way gives between five and six times as much light as an average square degree of the rest of the sky.

A NEW AND IMPORTANT TEXT-BOOK FOR SCHOOLS.—Professor John Trowbridge, of Harvard University, has written a text-book for schools, which D. Appleton & Co. have in preparation. It is entitled, "The New Physics," and admirably carries out the principles of the new education, in requiring the pupil to become familiar with the properties of matter and the phenomena of force by performing experiments for himself. A work of this kind is much needed.

METEOROLOGICAL SOCIETY.—Steps have been taken in Boston to organize a New England Meteorological Society. The object in view is to advance meteorological science, with carefully and properly localized observations with regard to rain-fall, temperature, etc. Mr. Upton, recently of the U. S. Signal Service, but now professor of astronomy at Brown University, will act as director of observations.

MAN AND DOG. The dog is the only animal able to follow man as far and as high as he can go, but the finer breeds of dogs cannot long endure the conditions of a hight of more than 12,500 feet, and there are towns in the Andes at as great a hight as 13,500 or 14,000 ft.

SOLID ALCOHOL.—It is said that a Russian chemist has succeeded in solidifying alcohol at a temperature of 130° centigrade. It was transformed into a solid white body.

TABLE OF CONTENTS.

EDITORIALS.—Work for Boys and Girls; The Lawson Gas Engine; Silica Percentage of Slags, 64. Passing Events; Alaska Mines; Geological Survey; Foundry Notes; New Ore Concentrator; Another Northern Gold Field, 68. The California Wire Works; Copper Smelting Furnaces; Making Patented Articles; Better Facilities in the Patent Office, 69.

ILLUSTRATIONS.—The Lawson Gas Engine, 65. General Plan Showing the Arrangement of Buildings and Machinery of the California Wire Works, 69.

CORRESPONDENCE.—The Blind Miner's Geological Discovery, 66.

MECHANICAL PROGRESS.—Advantages and Success of the Gjers Soaking Pit; Steel Plates by the Centrifugal Mode of Casting; New and Useful Alloys; How to Determine Expansion; Iron and Steel Direct from the Ore, 67.

SCIENTIFIC PROGRESS.—The Zodiacal Light; Elevated Observatories; Photography in Astronomy; Biological Researches; The Salmon Yield; Temperature of the Spheroidal State; Interesting Photographic Discovery; The Source of Electricity; The Light of the Milky Way; A New and Important Text Book for Schools; Meteorological Society; Man and Dog; Solid Alcohol, 67.

USEFUL INFORMATION.—What Pluck will Do; Porpoise Oil and Leather; Glycerine with Glue; To Make Sheepskin Mats; Analysis of the American Glucose; Making Alcohol Innocuous; Glass Coating on Metals; Zinc Enamel; Flour from Sprouted Wheat; Artificial Teeth, 71.

GOOD HEALTH.—Maxims for the Season; The Germ Theory; Strangely Affected; Ferrated Syrup of Peaches; Disinfecting the Sick Chamber; Poison in Tin Cans; Snake Poisoning; Light and Health; Poison in Ice Cream, 71.

MISCELLANEOUS.—Where Emery Comes From; Failure of the Mine Indicator; Tamping Drill-holes with Plaster of Paris, 66. Hoisting Ropes and their Attachment to the Cage; Mining; Clifton; Sulphur Deposits; California at the World's Fair; Note on Patching Platinum Crucibles, 70. The Transport of Goods by Electricity, 71.

MINING SUMMARY—From the various counties of California, Nevada, Arizona, Idaho, Montana, New Mexico, Oregon and Utah, 72-73

MINING STOCK MARKET.—Sales at the San Francisco Stock Board, Notices of Meetings, Assessments, Dividends and Bullion Shipments, 76.

Passing Events.

The announcement of new gold placers in British Columbia has created a local excitement only, most miners in California having had hard experience in British Columbia mining regions. Little is yet known of the new mines.

The prospect of building a big 80 stamp mill near Mono lake to work the low grade ores of Aurora is being discussed but as yet no definite steps have been taken towards carrying this out.

Some of the larger hydraulic mining companies are preparing to make the experiment of drifting their claims. There appears to be doubt as to the chance of profit, but a good fair trial will be made.

Several new quartz mines are about being started up in this State in different places.

Judging from telegraphic reports from the cholera infested region, the epidemic is being held in check pretty well. Measures are being taken on all hands to cleanse and purify in view of a possible visit from the disease. In this city sewers are to be overhauled, premises inspected, and a strict quarantine enforced.

Alaska Mines.

We had a conversation this week with a gentleman who has lately returned from Alaska, where he has been on some mining hueiness. He is not very favorably impressed with that country as a mining region. The climatic conditions are somewhat unfavorable, and there is not much mining going on. In a few places only are mines being worked.

Our informant visited Douglas Island, where there is a large body of low-grade quartz. They prospected this with a five-stamp mill, and are now engaged in getting out the lumber, etc., for a 120 stamp mill, which is being made in this city. The ore will only run about $6 per ton, with a good deal of sulphurets and very little free gold. The surface was richer, but the placer miners washed this off. They have water for about eight months of the year at this place, and the rest of the time everything is frozen up. The mill will be run by water-power. A good company has hold of the mine. The ledge is a wonderfully wide one, and nearly all solid. A tunnel was run, showing the ledge to be 490 feet wide, nearly all quartz. There are one or two other deposits of quartz on the island, not so large. They are all undeveloped, and their owners hold them at very high figures. One party went up this season, taking machinery to work claims, and intending to buy. Prices were so high, however, they thought they could get better mines for less money in California, so returned, bringing the machinery back with them.

At Juneau and Harrisburg, opposite Douglas Island, the placers are paying well on a moderate scale. Half a dozen different parties are at work. There are very few white men, and with all the Indians there are only about 200 or 300 men in Harrisburg. Our informant thinks two or three years will see these mines worked out. The deposits are up on the hillsides. The men work them by sluices. They get about $6 per day, nothing under $4 ground being touched.

There is a good deal of rich float in places but no ledges or deposits of quartz were found by the party of which our informant was one. He is of the opinion that there are not more than 250 or 300 white men in the whole territory, though a much larger white population is claimed. He visited Wrangell, where there are only 40 white men. Outside of Sitka and Harrisburg there are very few white men, and not many live at these places. At Harrisburg there are about 100 white men mining. They have plenty of water for five months of the year when the ice melts, but the rest of the time everything is frozen up.

In this connection the opinion of Mr. Ed. Schieffelin, the veteran prospector, who last year went 1,200 miles up the Yukon river prospecting, may be quoted: Mr. Schieffelin has been a prospector from his youth, first starting out at this business at the age of 14 in Oregon, and for the last fifteen years he has explored this western coast. He says: "Alaska will never amount to anything. The surface of the land is completely covered with moss as is this floor with carpet." He thinks the land is always frozen, and Alaska is good for nothing but fish and fur. There is gold there, he says, almost everywhere, but not in big paying quantities.

THE attention of manufacturers and merchants has been called to the Universal Exposition to be opened at Antwerp, May 2, 1885. The Belgian Consul, Wilfred B. Chapman, has a circular with reference to the project. It has received the approbation of the Belgian Government, and every effort will be made to assure its success. Merchants, manufacturers or others on this coast who may desire to have further information with regard to the conditions under which this exposition will be held, are cordially invited to examine, at the Belgian Consulate, documents that have been prepared for that effect by the Executive Committee. The Consul will be pleased to forward to any one desirous of participating a form of application for admission. Said application must be addressed to the Executive Committee in Antwerp not later than the 1st of September next.

FOLLOWING is a list of the placer canons of Los Angeles county: San Antonia, Palomas, Sierra Pelon, Placcrito, Mayo, San Gabriel, Santa Feliciana, San Francisquito and the Piru, the oldest gold bearing canon in the State which is located in Ventura county, but which rises in Los Angeles county.

The Geological Survey.

The U. S. Geological Survey has in this State a party under Prof. Becker, which has been for the past year making scientific inquiry into our quickeilver deposits. For several months the party were at work in Lake and Sonoma counties, and only lately returned from a trip of several months' duration around the New Idria mines. Last week they left to examine some quicksilver and coal fields in Contra Costa county.

The Geological Survey is now engaged in work of a more practical nature than was the case some years since. At that time they were doing reconnaisance work in Colorado, Montana, Wyoming and Utah, mapping out the general geology, and giving general descriptions of comparatively unknown regions. Much of the information collected is of great value, of course, though there was not much material of interest to the practical miner.

Of late, however, the parties have been working in mining districts where developments have been made, and recording results. They have had opportunities of getting underground and studying up the subjects of deposits, ledges, veins, etc. The maps and descriptions form useful guides to miners in other localities where similar formations exist. Some of the recent publications of the survey are specially valuable. That on "Mineral Statistics," particularly, edited by Albert Williams, Jr., is probably the most useful work to miners the Government ever issued, containing as it does information concerning the various mineral substances being mined in the United States, the extent, locality, value, etc. Another volume on the same subject will be issued the coming year. It treats of substances outside of the precious metals, such as manganese, salt, graphite, mica, lead, coal, iron, copper, asbestos, etc. The work now being done here by Prof. Baker's party is very valuable, and the publication of results cannot fail to be of great interest to California miners.

Foundry Notes.

At the Goss & Dow steam pump works they are building a pump with a capacity of half a million gallons a day for a new water company at South San Francisco. If the residents patronize this new company as expected, larger works will be erected next season. A large reservoir has already been built.

The Pacific Iron Works last week cast a very large mustard press for Kindler & Co.

The first large boiler made at the new shops of the Union Iron Works, in the Potrero, was shipped on Wednesday last. The first ship to lay alongside the docks went to the slip to take on the large boiler. The boiler is 12 feet in diameter, made of seven-eighths inch steel plates, and weighs 42 tons. It was made for Pope & Talbot, and will be put on one of the firm's tugs at Port Ludlow, to which place the *Comet* will carry it. The main buildings of the works are finished, and the massive machinery is being put in. A portion of the works are busy, and some 300 men are at work on boilers, machinery and other articles. A frame ship house is being put up at the water's edge, in which will be built hereafter the iron ships for which the works are mainly destined. This building alone covers 50x300 feet, and is furnished with all the necessary machinery for drilling, bending and shaping plates.

At the Risdon Iron Works a large force of men are at work on the twenty-seven miles of pipe for the Spring Valley Water Co., to which we have before referred. The Risdon Co. will finish this month the 120-stamp mill for the Alaska Mining Co., whose mines are on Douglas island, Alaska. Reference is made to these mines in another column.

THE ninth annual convention of the Amalgamated Associations, August 5th, will be one of the most important conventions in the history of the Associations. Measures will be decided upon that may stir up decidedly lively actions in the labor world. They contemplate the thorough establishment of the Association, and the adoption of a vigorous policy West and South.

THE trade opened up with Mexico by the new railroad to the City of Mexico is chiefly profitable to San Francisco merchants in the demand for canned salmon and fruits, green fruits, wine and powder, candles and quicksilver, for all of which there is considerable demand.

New Ore Concentrator.

Frederick Morris, of this city, has just patented, through the MINING AND SCIENTIFIC PRESS Patent Agency, an improved ore concentrating apparatus. It consists in means for separating the precious particles from the sulphurets or other material with which it is mechanically united, concentrating them and running off the other material by one or more successive operations over an apparatus prepared for the purpose, so that the concentrates thus obtained may be amalgamated, or otherwise treated, without the presence of a large quantity of worthless material which fouls and carries off the mercury, and interferes with the amalgamation.

This concentration is effected upon one or more perfectly plane tables having the surface slightly inclined from one end to the other, and sub-divided into narrow channels, the bottoms of which are covered with blanket, canvas or other fibrous material, in which the heavier particles of precious metal will be retained, while the worthless material will pass off, these channels being supplied with transverse troughs with regulating plates for each channel. Washing tanks are placed between the successive series of channels, so that the fibrous bottoms of the channels, when filled with concentrates, may be washed out, the concentrates allowed to settle, and the muddy water siphoned or drawn off, and a fresh supply of pure water added before they pass through the second series of channels.

It has always been customary to crush precious metal ore to a certain degree of fineness, and amalgamate in the battery, the whole of the material being taken to the amalgamating pans or other apparatus to be treated in bulk, the waste material not being run off until all the operations are completed. If there are sulphurets in any great quantity associated with the precious metal, they are frequently concentrated out by tables, riffles, or other apparatus, and afterward treated independently by chlorination or other process. The union of the gold in the working of ore, to which Mr. Morris' invention particularly applies, is not a chemical union, but only a mechanical one, similar to its union with the earth or rock, except that the gold is much finer and cannot be separated without being crushed finer. In this invention the ore, rock, sulphurets or other auriferous material being crushed very fine, is passed through the apparatus, where the gold is settled and retained in the fibrous bottoms of the channels with but little foreign matter, and when finally amalgamated the process is not hindered or the mercury fouled by the large quantity of worthless material by which the bullion obtained by the usual processes is often rendered nearly worthless.

Another Northern Gold Field.

There has been a great deal of gold taken out of the mines of British Columbia, since precious metal was first discovered there. The quartz mines never have amounted to much, but some very rich placers have been found and worked in various places. Two or three of the early "excitements" carried thousands of men from the California mines with disastrous results to most of them. The Fraser river excitement is remembered as one of the most widely spread the miners ever experienced. Thousands went to the region, but few made fortunes. Every few years new regions are discovered, but they are generally circumscribed in extent, and the ground usually taken up. The climate is against mining, for the winters are long and severe, and the country rugged and mountainous with innumerable streams. The mosquitoes in some places are enough to keep men away. This week the telegraph brought us news of another find, which has raised a local excitement at Victoria. On Lone Creek, a tributary to the Skeena river, 800 miles above Aberdeen, a man known as Jerry took out $600 in less than two days. On Lost Gulch, a short distance above Lone Creek, Harry McDame and J. O'Brien took out $1,300 in three hours, crevicing one piece that weighed $87, and was exhibited at the Skeena mouth. The gulch is fifteen miles long. Crowds have left the canneries for the new gold field, and many more would have gone but for the scarcity of mining implements and provisions. Mr. Cunningham has brought $1,200 in coarse gold from Lone Creek, taken in trade. The pieces range from the size of a bean to a pigeon's egg. Every one on the Skeena is jubilant at the discovery of gold.

The California Wire Works.

We present our readers with a double sheet lithograph of the shops and factories of the California Wire Works, whose property occupies the entire block, bounded by Bay, Powell, North Point and Mason streets, about 2 6-10 acres—it is the prominent feature of North Beach and can be observed very plainly from the decks of steamers entering the harbor. All the ground has been reclaimed from the bay, and has been filled in to the height of 22 feet above the bed of the salt water.

The general arrangement of the works can be seen by reference to the plan, and includes wire mill, galvanizing works, wire rope factory, barbed wire factory, wire works, wire weaving shops, machines and fittings, foundry, carpenters' and pattern making shops, store-rooms, warehouses etc.

The engine room is an excellent sample of what such a room should be; the main engine is a 300 h. p. Corliss engine, with a Deane condenser; there are two auxiliary engines of 35 and 15 h. p. respectively.

The wire mill has a capacity for turning out 3000 tons of wire per annum: it has been making on an average 7 tons per day.

The rope factory has turned out some very large wire rope and cables, and supplies most of the street railroads in this city.

The works are fitted for manufacturing wire, and everything from wire, as well as railings, gates, fences, etc., of wrought iron.

The Company has expended $680,000 in real estate, construction and equipment, and in raw and manufactured material. The stock-holders are among the most substantial men in town, and the enterprise is of great importance to this State. At the time of the completion of these works we published a detailed description in the MINING AND SCIENTIFIC PRESS, so the following facts in connection with the drawings will give a good idea of this flourishing home industry:

The California Wire Works bought the property in September, 1882, and in October commenced to build the foundations for their warehouses and factories. All the foundations are of concrete, of which there are over 50,000 cubic feet. The ground here has been filled in to the depth of 20 feet, below which is the bay sand and mud.

The consumption of water for the use of the wire mill is very great. In order to provide an ample supply, two artesian wells were sunk, and a satisfactory amount of water secured at about 100 feet. A beautifully working pump, made by Goss & Dow, is used for pumping the water to a tank containing 20,000 gallons, placed on a tower 60 feet above the ground.

In providing the foundation for the chimney, which is 100 feet high above its foundation and 11 feet 10 inches square at its base, a concrete foundation was provided, 16 feet square by 6 feet in depth, on which the brick chimney was erected.

There are four boilers, each 16 feet by 54 inches, with 54 3½-inch tubes each, with ornamental fronts, and fitted with smoke-consuming apparatus and all the most recent improvements. The building is 45x35, entirely fireproof, being of brick and iron.

Engine Room.

A horizontal Corliss engine, 24x48 inches, made by Hinckley, Spier & Hayes, of this city, is bedded on a heavy concrete foundation, and works smoothly and with great regularity. It is nicely finished and well proportioned, and reflects credit on the builders. The fly-wheel is 18 feet diameter and weighs 23,000 pounds. The driving pulley is 10 feet diameter by 50 inches face, and drives a ponderous treble leathern belt, 4 feet wide and 80 feet long. This is the largest leather belt ever made on the Pacific coast. It runs perfectly true, transmitting 300 horse-power with apparent ease and grace. Mr. H. B. Cook, the manufacturer, states that it took 56 hides to make it, and weighs 938 pounds.

The engine is surrounded by a handsome wire railing, to keep visitors out of danger, and the engine room, which is 30 by 45 feet, is finished off in natural wood, varnished. It is well lighted, as clean as a parlor, and is perhaps the most tastefully finished engine room on the Pacific coast, if not in the United States.

The engine is set up 10 feet above the floor, which, as well as the walls, is built of concrete. On the floor are the condenser and pump used in pumping the sea water from the bay beyond the sea-wall, where it is clean and pure, to the heater in the engine room, where it serves the double purpose of condensing the exhaust steam and supplying the new salt water swimming baths with hot salt water.

Machine Shop.

The machine shop is 45x100 feet. It is well equipped with a great variety of lathes, planers, shapers, drilling machines, bolt cutters, etc. In the blacksmith shop are the fires and forges, where much of the heavy railing-work made by the company is done.

The carpenter and pattern-makers' shops are immediately over the machine shop, and adjoining the latter is the pattern room, fitted up with shelving full of patterns, these together occupying a space of 45x120 feet.

Wire-working Department.

Passing over a bridge, the visitor enters the wire-working and wire-weaving departments. The former occupy a room 40x215 feet, and the latter a room 19x90 feet. Here wire is worked up into every conceivable shape—massive gates and guards for prisoners and insane asylums, and delicate flower-baskets for a lady's conservatory; large summer-houses and aviaries, and small mouse traps and trap cages—every conceivable kind of ornamental garden work, fire feaders and floral designs.

Wrought and cast-iron railing is being made a specialty, and there are here a great variety of special tools employed in the manufacture of railing. Many of the designs are entirely new, while others are taken from samples of work done in the 15th or 16th century.

The wire and iron-working department gives employment to a great many boys, who are learning a trade at which they will be able to earn a good living. In an adjoining room are a quantity of looms used in weaving all kinds of wire cloth.

Wire Rope Factory.

In the flat-rope sewing department are manufactured the long, massive flat wire ropes used for hoisting ore from the deep mines. The manufacture of flat rope requires great care, in order to secure uniformity of strain on each of the strands and make the rope run straight and even.

The main rope factory, where the wire is spun into strands and the strands into rope, occupies a building 275 feet long by 40 feet wide, and is filled with very ingenious and somewhat noisy machinery, all of which is the invention of Mr. A. S. Hallidie or his brother.

Great attention has been paid to the manufacture of wire cables for street railway. Mr. Hallidie naturally watches with a jealous eye all such ropes, being naturally anxious that the success of his invention of cable railways should not be impaired by imperfect cables.

Barbed wire-fence making is carried on in an adjacent building, and we were shown the *modus operandi*. They have facilities for making fifty tons per month.

Wire Mill.

All the different branches of manufacture of the California Wire Works, as well as the demand from outside sources, are supplied with wire from the wire mills of the company, which are situated adjacent to the other works; and they have been constructed with the utmost care. All the wire is drawn cold, through steel dies having holes in them of the proper size and form needed for the purpose, and in order to fit the solid iron rod for drawing down, it has to be carefully annealed; and afterward all the oxide and scale are removed by acids. The rod is then covered with a gelatinous coating, and is ready for the wire drawer. The machinery is very massive, the driving shaft being six inches diameter. There are eight different trains of revolving blocks used for drawing wire, containing 236 blocks, and the capacity of the mill is 400 tons per month. All sizes of wire are made, from ⅜ inch to 1-140 inch thick. The wire made at these mills is principally from Bessemer and Siemen-Martin steel, although a great deal of Swedish wire is also drawn. The tempering and annealing is done in furnaces specially built for the purpose, of the most approved plan; and after the wire is cleaned with acid, the acid has to be all evaporated from the wire, which is done in a drying and baking house of brick. All the lifting of the wire and rods is done by hydraulic cranes, and every thing is provided that modern practice permits, to save labor.

The general design of the works was made with a view to compactness, and completeness, and the engineering details and designing has been done by the company's engineer and draftsman, Mr. A. Grutter, in a manner eminently satisfactory to the Board of Directors.

Galvanizing works have been erected on the company's property on North Point street, for the purpose of galvanizing much of the wire produced at the company's mill, and a foundry has been constructed on the Powell street side of the property.

Warehouse.

The large fireproof warehouse of the company occupies almost the entire length of Mason street between Bay and North Point streets. It is 235 feet long by 40 wide, two stories, built of brick and iron.

This one of the leading and profitable industries of the Pacific Coast, furnishes employment to 150 men, many of whom earn as high as $30 per week at piecework.

Testing Room.

Before any wire is put into the hoisting rope or railroad cable, it is very carefully tested for tensile strength, torsion and bending, and in a room set apart specially for the purpose there are machines and apparatus specially made for the purpose.

The provisions against damage by fire are very complete. Four-inch mains run all around and through the grounds. There are six fresh water and six salt water hydrants in convenient locations. A tank of 20,000 gallons supplies the fresh water pipes, and from the four mains smaller pipes are run throughout the works, and have fire-cocks and hose always ready for use. The salt water supply is taken from the bay by means of a ten-inch main and a very heavy fire pump.

Copper Smelting Furnaces.

Till recently, the German cupola practice was invariably followed in the cupola smelting of sulphureted copper ores. The German furnace consists of a brick shaft, three by four feet, or four by five feet at the tuyeres, which are generally inserted at the back. The crucible is either closed, as in crucible furnaces, or is a sump or basin, in which the matte collects. It extends in front, beyond the shaft, and is divided by a wall dipping below the surface of the slag, as in the sump-furnaces, or the crucible is provided with two tap-holes, which discharge both metal and slag into basins outside the furnace, in which the separation is effected.

The channel furnace, with two eyes, a German brick furnace, smelts ten tons daily, and the length of the campaign seldom exceeds a fortnight, when the shaft must be relined, and the sump or basin retamped with brasque.

American metallurgists, untrammeled by precedent, have made great improvements in cupola construction and practice. Cupolas with circular tuyeres, or with six tuyeres surrounding a high jacketed furnace, or magnified Rachette furnaces, are the forms in general use in this country. The sump of the old German furnace has grown into a well, detached from the furnace, into which the products of fusion flow continuously. Mr. James Douglas, in a chapter of a Government Report, in speaking of copper smelting in the United States, states that neither the water-jacket nor the well can lay claim to be American inventions. Notwithstanding this statement, the fact remains that the water-jacket furnaces, as made and improved on this coast, have entirely superseded most of the other styles. Mr. Douglas asserts that Mr. John Williams, since well known in this country, built, in 1852, at Drontheim, Norway, sectional water-jacket furnaces, consisting of a circle of long, narrow water-backs, perforated by tuyere holes. In these furnaces he also used the germ of the modern outside well, by flowing the entire charge continuously from the furnace through an aperture into an outer sump. Water furnaces were long used at Pont Gibaud, France, and introduced from there by Mr. Rickard into the Richmond Co.'s works of Eureka, Nev.

In 1873, water-jacket smelters were put up at the Winnamuck, the Williams and the Flagstaff in Utah, on lead, and at the Copperopolis mine, on copper carbonate. Mr. Douglas states that the present familiar type of water-jacket was planned and first used at the Blue Bell mine by Mr. Lewis Williams. To the Oxford company he gives the credit of designing and using most successfully a well with a partition extending from side to side and reaching from the top to some distance beneath the surface of the clay.

Marking Patented Articles.

It ought to be pretty well known among patentees by this time, that they must mark their articles patented, if they expect to recover damages from people infringing. The U. S. Statutes require this. If they are not so marked, and people manufacturing are notified that the article is patented, damages can only be recovered, which might accrue after this formal notice is served. A case involving this question was decided by the U. S. Circuit Court in this city last week. About eighteen years ago, Horatio Allen, the President of the Novelty Iron Works, of New York, obtained letters patent for an invention, known as "Allen's patent packing." He made and vended the article until the patent expired, but never affixed to it a "patent mark," as required by the Act of Congress. This omission led the public, especially in this city, to believe that the article was not patented, and for many years it was used extensively here by manufacturers of steam engines, without suspicion that they were invading any person's rights. In August, 1875, W. W. Hanscom, acting as agent of Allen, notified parties in this city, that they were using a patented invention. Afterward, Allen brought suits against William Deacon, Rankin, Brayton & Co., the Ætna Iron Works and several other parties to recover large sums for infringements, extending over a series of years.

The case against Deacon was selected as a test. The defense was that the statutory notice had not been given, and that the defendant did not know of the existence of the patent, until notified by Hanscom; that after receiving notice, he used only enough of the packing to finish an engine he was then constructing, and that before the suit was brought he had offered to pay for all he had used, at the price customarily charged by Allen, which in this case amounted to $126.55. Judge Sawyer, in his decision, holds that the statute requiring notice must be observed, and that as it was not complied with, and as Deacon had no knowledge of the patent until notified by Hanscom, he was obliged to pay for such infringement only, as occurred after notice. This decision renders Allen's recovery merely nominal, and saves the parties sued the judgment of large amounts.

Better Facilities in the Patent Office.

For many months past there has been great complaint among the inventors of the country and those having transactions with the U. S. Patent Office, of the great delay in the business of the office. In all the rooms they have been so overcrowded with work, that cases would have to lie two, three or four months before they were considered. The Commissioner himself called the attention of Congress to this matter, and statements were prepared and submitted by the different examiners showing the number of cases pending, the length of time since received, etc. Each one required more assistance to get his work done promptly. As we have before stated the Patent Department pays the Government a handsome profit above expenses, all of which money comes out of the pockets of the inventors. It seems strange therefore that their business should be delayed owing to lack of force to carry it on. Even now there are hundreds of cases pending which have been filed three or four months.

It seems that the numerous complaints have had an effect. About two weeks ago there were 106 promotions in its Patent office, preparatory to a large increase of the clerical force. The rooms formerly occupied by a part of the Census Bureau have been leased by the Interior Department, and will be occupied by the Indian Bureau. The twelve or fifteen rooms in the Interior Department thus vacated will be placed at the disposal of the Commissioner of Patents to accomodate his increased clerical force. The Commissioner believes that the office will soon be able to dispose of the accumulated patent business, and to keep up hereafter the current business of the office. Three new divisions will be created, the character of which is not yet determined. A board of experts is now making investigation with a view to ascertain how far the business of the different bureaus is in arrears, and to recommend such corrective measures as in their judgement will faciliate the public business.

THE sum of $1,250,000 is given as a safe and conservative estimate of the monthly product of the Butte district, Montana.

Hoisting Ropes and Their Attachment to the Cage.

Among other papers, the journal of the British Society of Mining Students, contains an able and exhaustive article on colliery winding ropes and their attachments to the cage, in which the materials from which the ropes of the hemp class are manufactured are first described; and the nature of combination ropes of Russian and Manilla hemp, which are found in the writer's experience to last twice as long as ordinary Russian hemp ropes, is discussed. As mines increased in depth hemp became unavailable, as to 240 to 300 fathoms of its length is equal in weight to its working load; and iron wire ropes were introduced into the Hartz in 1830, but not into this country till ten years later. But an iron wire rope is strained to its working load with 435 fathoms of its own length, so something stronger was required for such mines as Ashton, near Manchester, which is 448 fathoms deep, and in 1860 steel was introduced in the manufacture of ropes and has been gradually increased in tenacity, until now plough steel has a breaking strain of 120 tons per square inch. For great depths ropes are lightened by making them tapered, and in this paper the taper ropes employed in the Adelbert silver mine in Bohemia (612 fathoms deep) are described. They consist of 36 wires manufactured from steel having a tenacity of 72 tons per square inch, the taper being given to the rope by reducing the gauge of the wires from .103 inch diameter at the drum end to .075 inch at the cage. It appears that these ropes can now be manufactured almost as easily as the ordinary kind.

The construction of ropes is next dealt with; the hawser, shroud, and cable laid forms of hemp ropes are described; and then the original selvage rope which consists of a bundle of iron wire laid parallel and bound together; and the laid and compound forms of wire rope in use at the present day. Among the latter forms of ropes are mentioned Lang's patent, in which the wires and strands are both twisted in the same direction, thus giving a much longer surface of wire exposed to friction which lessens the risk of individual wires breaking at the crown of the strands; and also a new form of rope made in Switzerland in which coarse cotton yarn is spun about the separate wires so that a soft bed is obtained between them and soft rest for the whole rope; this rope is said to be very durable, and not liable to rust. The author does not approve of wire centers which are liable to break when the rope stretches; hemp centers on the other hand stretch with the rope and allow the strands to bed themselves solidly. He gives short empirical rules for finding the weight and strength of ropes, and shows that the strength may also be calculated in a rational manner from the sectional area of the wires and the tenacity of the material of which they are composed, and deducting one-eighth for the loss of strength due to the lay.

In dealing with the duration of ropes he recites some good practice, viz.:—The size of drums should be ten feet in diameter for a rope one inch in circumference, adding six inches to the diameter for every additional one-fourth inch in circumference; pulleys should be the same size. The incline portion of rope, from pulley to drum, should make an angle of less than 45 degrees with the rope in the pit, and it should never deviate further from the plane of the pulley than one-fiftieth of the distance between the pulley and drum shafts. Ropes should not be shifted from one drum to another even although larger, and there is no saving in turning them end for end. Excessive wear of that part of the rope which is over the pulley when moving the cage at bank should be avoided by re-capping which at some collieries is done every six months.

Roughly, he finds iron ropes to last one year, crucible steel 1½ years, patent steel 2 years, and plough steel ropes 2½ years. A table is given showing all the details of several ropes, the number of months they lasted and the tons of coal drawn, from which it appears that the cost per ton for winding ropes varied from .07d. to .30d. per ton.

Treating of the connections of the rope to the cage, the writer remarks that the working parts of detaching hook are liable to rust together, especially those composed of plates, and that it is desirable to keep a spare one and overhaul them every three months.

The capping of ropes is elaborately entered into, and tables of experimental results are given which are very suggestive. The hooped form gives the best results, and even these on a rope having a breaking strain of 60 tons had the rope drawn from 2 inches to 2¾ inches out of them with a strain of 25 tons. In three of the experiments, the rope broke inside the cap with a strain of from 44½ to 49 tons, showing that the cap or hose is the weakest part.

THE OLDEST MINERS' UNION.—The Miners' Unions of Germany are the oldest associations of ths kind iu the world, having originated in ths silver mines of the Hartz Mountains more than 600 years ago.

MINING NEAR WASHOE CITY.—The parties who hold a United States patent for a number of galena mines west of Washoe City will commence the work of developing the property some time this month.

Mining.

"Industrial progress, if I may be pardoned for the expression, goes by steam, and as the needs of man may be said to expand indefinitely, there is an immense field for the employment of the precious metals."—*Victor Bonnet, October 15, 1868.*

As the years roll on, the foregoing becomes more and more a pertinent fact to thinkiug men. It is one of Nature's penalties that riches never satisfy men. The more they accumulate the more they want, and the more they have the sharper becomes their invention of ways to ostentatiously display it. Cunning artisans, knowing this, are struggling, perpetually, to fashion works of art which shall minister to the pride of the vulgar, and charm the tastes of the refined. More and more these artisans lean upon the precious metals for material on which to work, until now they absorb a heavy percentage of their product. At the same time the trade of the world is expanding so tremendously that the call for increased quantities of gold and silver to serve as a measure of values is steady. We have made the foregoing as a preface to say that while the financial centers of the East are fearfully shaken, while there are apprehensions that there will be difficulty in disposing of the harvests advantageously; while the shrewdest business men are slowly reaching the conviction that hard times for three or four years will be the rule, there should be neither apprehension nor nervousness in this region, because around us is plenty of material which hard times does not affect; which since the days of Abraham has been to mankind what the Polar Star is to the night. But while mines are here in abundance —mines that with reasonable expenditures would return certain fortunes to their owners—there is not a proper effort being made to place them in producing form. To make that effort there should be a combination made among the leading mining men in this region. By putting two or three enterprises in the proper form, we believe that with the backing of good men here any needed amount of money might be obtained in the East to prosecute developments and to erect reduction works. Just now the men who have some money left—and there are millions of them—are not anxious to purchase railroad stocks or bonds, and if we mistake not a good many of them are remembering with grief that in the railroad stocks which everybody was anxious two years ago to dabble, more money has been lost in a single month of this year than all the money the East has ever lost in mines amounts to. Such men are in a condition now to listen to reason, and could the effort be made to obtain just enough money to complete necessary work and get properties on a paying basis, it might be done; for the feeling in the East now is, we imagine, very much like that experienced by a rat when he, after a careful survey of a ship, makes up his mind that the proper thing to do is to go ashore. There is one fact which men here do not appreciate at its full value, which is, that there is no other occupation in this region half so legitimate as mining. Farming is good, merchandizing is all right—there are a thousand honorable occupations—but here all else leans on the great industry of mining, and from the first on this coast the pulse of business has been quickened or retarded in exact proportion to the yield of the mines. With the surroundings which Salt Lake has it is wicked that hard times should ever be known here.—*Salt Lake Tribune.*

Clifton.

A correspondent of the Globe (Arizona) *Chronicle* says:

At last Clifton is fairly upon the road to prosperity. The Arizona Copper Company have been running three stacks in their immense smelter plant at this place for over a week. They employ about sixty men about the furnaces, and will shortly be obliged to put a largely increased force to work in their mines, as they are now smelting about 200 tons of ore per day, and the entire reserve of extracted ore at the respective mines will not exceed 15,000 tons—only a little over two months' supply for the present smelting capacity. The company has two thirty-ton Rankin and Brayton jackets all ready to blow in, and will probably add them to their present number of working furnaces during the coming week. The output of bullion has been estimated in value at $5,000 per day since starting. This will, of course, be considerably increased when the other two smelters are blown in.

The company's twenty-inch guage railroad from the smelters to the numerous mines owned by this company is kept running all the time to its fullest capacity, bringing down ores for reduction. At present they are using but one of their three small locomotives, but it is intended to put on one and perhaps both of the others, thus increasing the capacity of the little railway.

The machinery at the company's reduction works is being run by water power, of which there is a great plenty for all practical uses; but in case of a failure in the water, works are provided with a Corliss compound engine, etc., which can be used in place of the water power.

The narrow guage railroad from Lordsburg, also the property of the Arizona Copper Company is doing a good paying business, running one train each way per day.

The Detroit Copper Company, Wm. Church, president and superintendent are about to move their furnaces from the Frisco River, where they are now located, to their mines, about nine miles distant, where they will be run by steam power instead of water, as at present. This company have laid a pipe line from the river to the new smelter site, and the water necessary for their use will be forced from the river, using their old water power for that purpose. Their various mines will be connected with the smelters by a system of inclines and tramways, doing away with all manual labor in the handling of their ores after they leave the mine.

Sulphur Deposits.

Mr. D. M. Jewett, writes from White Oak, N. M. to the *Mining Review* about the discovery of sulphur deposits in Tom Green county, Texas. He thinks there is no question that the deposits would pay great profits, but for the disinclination of capitalists to embark in mining in new localities, he doubts whether these Texas deposits will be for many years of any practical importance.

It has been known for many years that there existed in America sulphur deposits exceeding in value and importance all those of the Island of Sicily, and still we have imported our sulphur and let our own deposits be unworked. In the parish (county) of Calcasieu, in my own State of Louisiana, not far from Lake Charles, and precisely under the track of the N. O. and Texas Ry., there is a deposit of sulphur purer than the usual "refined article of commerce" which has been known for more than twenty-five years. The bed reaches in places a thickness of 109 feet, and never, I believe is less than 98. From 90 to 98 feet of this is commercially pure sulphur. The borings made from 1869 to 1871 extended over some 2,500 acres, and the bed was reached at an average depth of 428 feet. It lies under a perfectly level country, fuel and timber are near and abundant, labor cheap, transportation on the ground and connection perfect with the railway system of the continent, the inland water-ways of the great valley, and with our second best seaport. The overlying strata present no special difficulties in the present state of engineering science.

No argument is necessary to demonstrate that the scientific and economical working of this bed will constitute an enormously profitable enterprise, nor that the profits may be continuous for generations, and this is at prices very much below the present cost of the Sicilian article.

The value and advantages of this property have been known to many competent persons for many years. But the disinclination to which I have hereinbefore alluded, and which retains capital in beaten paths, has presented its intelligent utilization. General Thomas Jordan, for instance, could give an instructive illustrative experience in connection with this very property.

The first company incorporated to deal with this property were chiefly French Creoles, of Louisiana, under the presidency of General Jules Brady. That company was rather of the opinion that a lamp-post could only be properly set by a Parisiau, and consequently imported an engineer from France. He undertook to sink a circular sectional shaft of cast iron. This broke at 110 feet, and was abandoned along with the enterprise and $250,000. The property is now owned by a company, headed by the Hon. Duncan F. Kramer, late of the Tariff Commission. I think that this company has done nothing definite.

In fact, mining enterprises in the South (outside of the gold fields of North Carolina and Georgia, and the phosphate fields of South Carolina), can hardly be expected to be carried to the productive point in Southern hands. Capital finds before it full employment in fields with which it is thoroughly familiar. Timidity, the result of ignorance, keeps it from the improvement of natural resources, in which it would find more abundant profits and infinitely less risk. Very few Southern men are qualified by technical knowledge or experience to open or manage such a property, and what few there are are necessarily in employment elsewhere than in the South.

An investment of northern capital, much less than the amount sunk in each of several "brilliant" mining ventures of the past few years, and competent management, would develop in the locality described, a most profitable, safe and permanent business.

All the same, I will venture to say that a dozen years hence we shall be importing Sicilian sulphur, and the deposits in Lake Charles and in "Tom Green" will be waiting the advent of a more enterprising generation.

PROSPECTING.—A good deal of prospecting, says the *Enterprise*, is being done to the west of Mount Davidson, among the hills down toward Washoe Lake. The country down that way is full of quartz veins, few of which have been explored to any great depth. There is also everywhere much float quartz, some of which is doubtless from veins that have not yet been discovered, they being what are called "blind leads," being covered with surface soil and debris.

THE decline in the price of copper makes it not improbable that this material will be used as roofing, among other uses. It does not have to be painted, like the tin roof, every two or three years, and it is not subject to rust.

California at the World's Fair.

We are glad to see that the people of the State are turning their thoughts quite generally to the advantage of a creditable exhibit at ths coming World's Fair in New Orleans. There is every reason, industrial and sentimental, why our State should be well represented on this occasion, which will draw people from all the country and all the world to the sunny South. There never was a great fair which can be so easily reached from this State, and probably none where a good show of our products can do so much toward spreading the fame of the State. There are several movements now in progress toward a fair display of our products. Private and corporate enterprise is enlisted in showing special products. The State Board of Agriculture is fostering the idea of making a collective exhibit from the material to be shown in Sacramento the second week in September, and probably some of the elaborate county exhibits which are now in preparation for the State Fair will be sent forward by themselves to the credit of the counties represented. The State Horticultural Society also has the matter under consideration. Beyond this, it is announced that T. H. Goodman, General Passenger and Ticket Agent of the Central Pacific Railroad Company, has requested all agents of the Central Pacific and leased lines, including the Southern Pacific railroad, to exert themselves in calling the attention to the golden opportunity of advertising the State by collecting and forwarding samples of the various products of California to the World's Industrial and Cotton Centennial Exposition, which will be opened in New Orleans next December and continue till the following May. The railroad company's agents are requested to ask the people with whom they are brought into intercourse to furnish samples of their grain, of their fruit, of their products, and also of the soil on which these things are raised. They are instructed to obtain full information about yield, mode of cultivation, extent of orchards, vineyards or grain fields, and to make careful notes of the same. Mr. Goodman, speaking for ths company he represents, says:

"We wish each county, however distant from the lines of our roads, to be fully represented. Neither do we wish to concentrate attention upon any one industry, but, by showing samples of all productions, to demonstrate to the world the great capacities and almost boundless resources of California. Experiments are being tried, many of which have demonstrated that a number of profitable industries can be added to those which have already made this State famous. It is desired to fully represent all these efforts towards productive possibilities. We wish full information regarding any and all samples, in order that the labels shall truthfully state those facts which will be interesting to the beholder of the exhibits. For this purpose we ask that each sample be carefully packed and accompanied by a label showing the name and variety of the article, the yield, the age of the tree on which grown, if a fruit, and the length of time the ground has been cultivated, and whether winter-sown or summer-fallow, if the sample is a grain; the name and postoffice address of the producer, the exact locality where grown (specifying the county and number of miles and direction from nearest town of prominence), also any other information which may be of interest. In cases where the contributor is not the producer, we wish the name and address also of the contributor."

Surely something good should come out of all these different agencies which are at work, and it is quite probable that Col. Andrews, the California commissioner, will have material to awaken the California glow afresh in his own heart and which he is reputed to impart to all who come under his influence.

Note on Patching Platinum Crucibles.

The following was read before the American Institute of Mining Engineers by H. J. Seaman, Catasauqua, Pa.:

The cost of keeping platinum ware in repair becomes such an important item in laboratories where much fusion work is done that a method of saving in this direction may not prove unacceptable to at least some of the members of the Institute.

Some two years since I had the misfortune to puncture an almost new Bishop crucible. As an experiment I endeavored to patch it, and with such success that it is still in constant use.

This may be accomplished in the following manner: The crucible and patch, which should be of stout foil, are rubbed bright with silica, or rotten-stone; a light platinum wire, welded to a corner of the patch, and the whole treated for several hours with hot concentrated hydrochloric acid; after which they are thoroughly washed with distilled water and dried.

The head of an ordinary iron rivet, 4 inches by ⅝ inches, is rounded off by hammering to somewhat the shape of the crucible. This is sunk 2 inches in a block of hard wood, and firmly wedged in place. This serves for an anvil. The hammer is an ordinary cast-iron toy, 1½ inches long and ⅝ inches in face, mounted on a ¼-inch iron rod, 10 inches long.

A gas blow-pipe is fixed in a horizontal position, and the strongest heat obtainable with it directed upon the rivet head; this soon attains a bright red heat, and the crucible is now dropped over it. The patch, by means of the thin platinum wire, is now held over the point of operation; a few taps of the hammer serve to

fix it to the crucible. The wire is now nipped off, and the patch firmly united to the crucible by continued tapping with the hammer, steadying the crucible with a platinum spatula or wire. The metal should be maintained at as nearly a white heat as possible throughout the operation. With care the metal may be so perfectly united as scarcely to show the outline of the patch. After the operation the crucible will be found very much out of shape, but it may easily be brought back by tapping with a hammer over the rounded horn of a small anvil.

I am at present using three patched crucibles; one, previously mentioned, has been in use about two years; has served for at least two hundred fusions since patching, and is still in good order. Another, which developed an extensive crack in the bottom, was repaired by a circular patch a trifle smaller than the bottom. The third has a patch on the side near the bottom. These have all done good work.

I am in the habit also of welding my platinum triangles, thereby making them light, strong and durable.

The Transport of Goods by Electricity.

Professor Fleeming Jenkin, of Edinburgh, delivered a lecture on "Telpherage, or the Automatic Transport of Goods by Electrical Means," before the Glasgow Science Lectures Association. The chairman (Sir William Thomson), in introducing the lecturer, said that Professor Jenkin proposed to apply electricity in an altogether novel way, and one which was most interesting to the society. The professor had long been interested in engineering subjects, and his latest idea was to show how goods, parcels, and possibly passengers, were to be carried overhead through the same power as that which had done so much under the sea in the shape of the submarine cable. Professor Jenkin, at the commencement of his lecture, explained the origin of the word "telpherage," and said that it was derived from two Greek roots, and meant the "far carrying." It was the old story of a person hanging a pair of boots on a telegraph wire and expecting that they would be sent to a distant friend that had set him thinking about the possibility of really carrying the idea into practical use. By means of a model railway, built upon the platform on raised supports, wires stretched from point to point taking the place of fixed rails, he proceed to explain the system upon which he would carry out his invention on a larger scale. Two model trains were set in motion and successfully made a round of the circular railway, the motors working admirably. The professor then explained the system under which the motors worked, and how the electricity was utilized in carrying along the road the load put on the suspended wire railway. In working out this idea he had simply made use of the perfectly well ascertained electric laws which had been developed chiefly in connection with electric lighting. Some ten years ago, had this idea occurred to him he should have put it to one side, as at that time there was too much to be done in respect to electricity to make it practicable. But one thing led to another, and electric lighting had developed dynamos to such an extent that sufficient power had been attained to use it as a motor, and it was the great development of that power which had led him to make the experiments the result of which he was about to explain. He then gave a description of the "line," and referred to the difficulties he had experienced in getting up a proper kind of "locomotive." He had aimed at conquering gradients that no steam locomotive could look at. It was necessary to avoid in electric locomotives all loss of power by friction. It took curves easily, and without any friction whatever, and there was hardly any possibility of the trucks being thrown off the line. A model train was next run along a model railway terminating in a series of octagon circles, and the trucks took the curves freely and without a hitch. He now came to the economical question, to see how far from being a mere toy the idea could be developed into a practical working machine able to do the work required by the manufacturers of the country. The lines were not intended to compete with the railways, but rather to act as feeders to them by collecting goods throughout districts, carrying them to the stations, where they would be put into the trucks. This would have a great influence upon the railway traffic. The class of line he would put up with posts and rods ought not to cost more than £500 per mile. For engine-power for a 25 mile line he would put down £1,500 per annum. In concluding, Professor Jenkin said he did not propose to touch upon all the matters connected with the possible development of his scheme. He would simply leave his hearers with the impression that the whole contrivance was what he might simply call an electric horse and cart.

THE copper product in the United States has increased from 11,470 tons out of a total of 78,037 tons—14.70 per cent in 1871, to 52,080 tons out of 193,454 tons—27.71 per cent in 1883.

THE number of workmen engaged in the copper mines of Prussia increased in 1882 to 12,787, as compared with 11,946 in 1881.

USEFUL INFORMATION.

WHAT PLUCK WILL DO.—The London *Times*, of a recent date, contains some interesting facts about Henry Bessemer. It was a chance remark at a gun trial, in France, which gave to the great steel king the idea of improving and strengthening gun metal. He incurred an immense outlay, he built furnace after furnace, he tried machine after machine, he took out patent after patent, and he saw the money he had amassed by previous inventions fast melting away. After sundry partial successes, he fell into disrepute, and was sneered at by the iron manufacturers as an unpractical enthusiast, while the Woolwich authorities had been snubbing him, as a matter of course. A few months later Bessemer had produced steel worth from $250 to $300 per ton, from iron that cost him only $35 per ton. "He could then see in his mind's eye, at a glance, the great iron industry of the world crumbling away under the irresistible force of the facts so recently elicited." Fourteen years afterwards these experimental works were sold for exactly twenty-four times the whole subscribed capital of the firm, after returning fifty-seven fold, and the manufacture he originated is now estimated to be worth no less than $100,000,000 yearly!

PORPOISE OIL AND LEATHER.—A new industry is growing up on the Atlantic coast, which may soon, in a great measure, supplant the loss to that portion of the Union of the whaling business. Small vessels are now being fitted out to catch porpoises, which are very numerous on the Atlantic coast and bays, and which have hitherto attracted very little attention in an industrial point of view. One of these vessels recently arrived in Philadelphia with 75 fat porpoises, from which the following products was expected: 1,000 gallons of oil, 3,750 pounds of hide for leather, and 15 tons of phosphate. The oil is said to be equal in value to sperm; leather from this source is pronounced equal to the best French calf. It has been made in small quantities for some years in England and Germany. The fish are caught in a large sea net, with wings a mile long, by which they are inveigled into a sack some 60 feet wide by 24 deep and 120 feet long. The 75 fish above alluded to were caught in two hauls, both being made in one day. If the above items are correctly stated, it will be readily seen that the business might be made a very lucrative one.

GLYCERINE WITH GLUE.—A German chemist, named Pusche, a native of Nuremburg, reported to the trades-union of that place that he met with great success in using glycerine together with glue. While generally, after the drying of the glue, the thing to which it is applied is liable to break, tear or spring off, if a quantity of glycerine equal to a quarter of the glue be mixed together, that defect will entirely disappear. Pusche also made use of this glue for lining leather, for making globe frames, and for smoothing parchment and chalk paper. He also used it for polishing; mixed wax with the glycerine is not used. The glycerine has also some properties in common with India rubber, for it will rub out pencilings from paper, so as to leave no mark whatever. A paste made of starch, glycerine and gypsum will maintain its plasticity and adhesiveness longer than any other cement, and therefore recommends itself for chemical instruments, and apparatus used by pharmacists.

TO MAKE SHEEPSKIN MATS.—Make a strong lather with hot water, and let it stand till cold; wash the fresh skin in it, carefully squeezing out all the dirt from the wool; wash it in cold water till all the soap is taken out. Dissolve a pound each of salt and alum in two gallons of hot water, and put the skin into a tub sufficient to cover it; let it soak for twelve hours, and then hang it over a pole to drain. When well drained, stretch it carefully on a board to dry, and stretch several times while drying. Before it is quite dry, sprinkle on the flesh side one ounce each of finely-pulverized alum and saltpetre, rubbing it in well. Try if the wool be firm on the skin; if not, let it remain a day or two, then rub again with alum. Fold the flesh sides together and hang in the shade for two or three days, turning them over each day till quite dry. Scrape the flesh side with a blunt knife and rub it with pumice or rottenstone.

ANALYSIS OF THE AMERICAN GLUCOSE.—The commercial samples of liquid starch sugar, or "glucose," examined by a committee appointed in the United States to investigate the subject, were found to contain from 34.3 per cent. to 48.8 per cent. of dextrose, 0 to 19.3 per cent. of maltose, 29.8 to 45.3 percent. of dextrin, and 11.2 to 22.6 per cent. of water. The samples in solid form—"grape sugar"—arranged in composition from 72 to 73.8 per cent. of dextrose, 0 to 36 per cent. of maltose, 4.2 to 9.1 per cent. of dextrin, and 14 to 17.6 per cent of water. Three especially prepared samples of "grape sugar" contained respectively 87.1, 93.2 and 99.4 per cent. of dextrose, the last being "crystalline anhydrous dextrose." The ash in "glucose" varied between 0.335 to 1 per cent., and in the "grape sugars" between 0.335 to 0.75 per cent.

MAKING ALCOHOL INNOCUOUS.—The discovery of a method for taking the fusel oil out of alcohol is creating something of a sensation in scientific circles. It is claimed that the experiment has succeeded in reducing the deaths from alcoholism in Stockholm from 600 to 100 per annum; and the inference therefore widely drawn that the new process robs the whisky bottle of its terrors. But information is lacking as to whether the product of this process still retains the ability of getting the drinker intoxicated. If liquor is still to possess the power of bringing its imbibers down to the level of beasts, by getting first uproarious and then stupid, it does not seem to make any vital difference whether it contains the fusel oil or not. On the other hand, if the power of intoxication is removed from the whisky, none of the drinkers will want it. Could anything more disgust the old toper who starts out to get comfortably full and strikes a beverage that has no drunk in it?

GLASS COATING ON METALS.—The following method has been suggested for coating metallic surfaces with glass, which may be found to answer various purposes. Take about 125 parts (by weight) of ordinary flint-glass fragments, 20 parts of carbonate of soda, and 12 parts of boracic acid, and melt. Pour the fused mass out on some cold surface, as of stone or metal, and pulverize when cooled off. Make a mixture of this powder with silicate of soda of 50 B. With this coat the metal to be glazed, and heated in a muffle or other furnace until it is fused. This coating is said to adhere very firmly to steel or iron.

ZINC ENAMEL.—Calcine 100 parts lead and 20 to 30 parts of tin thoroughly. Melt 100 parts of this mixture with 100 of white sand, and 25 or 30 parts salt. When cool, pulverize very finely. This gives a dead white enamel for the ground. The black can be formed by the addition of black oxide of manganese, or protoxide of iron. Apply to metal in form of a paste, in water to which a little glue has been added, and fire.

FLOUR FROM SPROUTED WHEAT.—The best way to ascertain whether flour has been made from sprouted wheat is to stir a sample up with water, filter, test with corallin solution, rendered red with a trace of alkali. If the flour is acid it turns yellow. Methyl orange can be used. Litmus is less delicate in obtaining the reaction.

ARTIFICIAL TEETH.—There are twelve manufactories of artificial teeth in the United States, which make 10,000,000 of those useful articles per annum. They are made of feldspar, kaolin and rock crystal.

GOOD HEALTH.

Maxims for the Season.

Keep yourself as cool as possible.—Although we are well aware that by many this direction will be treated with ridicule it constitutes, nevertheless, one of the chief means for preserving health during the warm season. It does not imply that you are to live in an ice-house, or to seek for any artificial refrigerant, but simply to avoid all unnecessary excitement, whether mental or physical.

Let your clothing be light and loose.—At the same time that this maxim is adhered to, care must be taken, whenever any sudden reduction of temperature occurs, to adapt the clothing to this change; hence, a warmer dress will be required early in the morning and late at night than during the middle of the day.

When in a state of profuse perspiration, never throw off a portion of your clothing.—The best plan in such cases is to retire immediately within doors, and change the damp clothes for others perfectly dry, the whole surface of the body being previously well rubbed with a towel. The same precaution is proper when you have been accidentally wet by a shower of rain.—*Journal of Health.*

THE GERM THEORY.—Interesting news comes from India which will strengthen the germ theory of contagious diseases. The German Medical Commissioners who visited Alexandria to study the origin of the plague there last fall, and later went to India for a similar purpose, report that they have found the same kind of parasite in a water tank in Calcutta, and in a suburban village where the cholera appeared, that was discovered in the intestines of victims of the last plague in Egypt. This shows that the disease in Egypt was probably cholera pure and simple, and not a disease similar to it. It also tends, as we have said, to sustain Dr. Koch's theory that cholera is caused by a thread-like parasite, which enters the body. Much remains to be done before this hypothesis can be fully accepted. The bacillus, for instance, must be cultivated and be made to cause cholera in animals. After that it will be time to inquire whether it is possible to produce a mild and harmless form of this disease in human beings, and thereby prevent the ravages of pestilence.

STRANGELY AFFECTED.—Several years ago a daughter of Hon. A. C. Ramage of this county was bitten by a copperhead snake on the thumb of her right hand. The only sign of injury at the time was two very small globes of blood from two almost imperceptible marks as of a needle point. The young lady was not aware, at the time she was bitten, of the presence of the snake; but a few minutes after noticing the two marks on her thumb her hand and arm began to swell, and she became deathly sick. It was several hours before the fact that she had been bitten by a snake was learned—not until her father went to the tree under which she had been seated, and there discovered the snake, which seemed quite as sick as the lady. He killed the snake, and, returning to the house, every possible remedy was applied to save the life of his daughter, and, though she lay for weeks when there was little hope, she recovered. The remarkable part of the occurrence is that the daughter is still living, is married, and has several children, and every year on the return of the anniversary of the date of the poisonous bite, the right hand and arm become spotted and swelled, and the sickness and symptoms attending the first occasion all return, and strong and vigorous remedies have to be applied as at first. Just now the lady is writhing in agony, and fears are entertained of her recovery as the case seems more violent this year than since the first attack. The effects of this kind of poison on the human system ought to be an interesting study to the medical fraternity. In this case none of the children are affected.

FERRATED SYRUP OF PEACHES.—A new and very pleasant mode of administering iron is recommended by an Italian medical journal, the *Gazetta Medica di Torino*. The preparation may be made as follows: Take of good ripe peaches, free from the stone, 1,000 parts (by weight); iron filings, free from copper, 50 parts, and sugar 300 parts. Put the peaches in an iron vessel and mash them up, mixing sufficient water with them to make a paste; add the iron filings and set the whole to macerate for ten days, stirring frequently; then filter through a thick cloth to obtain the extractive matter. A little water is poured on the residue and filtered through paper. The filtrates are mixed, and to the fluid, which is of a brownish-green hue, is added the sugar. The mixture is now simmered at a moderate heat (not over 60 C.) to the consistence of a syrup. A clear greenish-brown fluid is the result, having the taste and smell of peaches, and giving the usual reactions of the iron preparations. The preparation is said to be very pleasant to the taste, and nearly or quite free from the disagreeable taste of iron as usually administered.

DISINFECTING THE SICK CHAMBER.—Dr. Vilandt recommends that the atmosphere of a sick chamber where the patient is ill of diphtheria, measles, scarlet fever, or any allied disease, should be impregnated with the odor of a mixture of equal parts of turpentine and carbolic acid. Half a teaspoonful of the mixture will be enough at a time, if it is put into a kettle of water kept near the boiling point. The odor generally gives some relief to the sufferer, and tends to prevent the spread of the malady. A disinfecting lamp can also be advantageously used and may be easily prepared for purifying any place where a disagreeable odor is perceived, being especially useful in sick rooms and in damp cellars where vegetables have decayed. Take any glass lamp for burning kerosene or oil, fill it with chloric ether and light. The old fashioned camphene or burning fluid lamps, with a small, round wick, will burn longer and be of more service than the flat-wicked lamps. While the ether burns, a disinfectant escapes that will soon purify the most offensive atmosphere, even that of a sewer.

POISON IN TIN CANS.—That serious if not fatal results have resulted from eating fruits, meats, etc., that have been put up in tin cans, is a fact generally acknowledged; but the source of the poison seems to be a matter of much doubt. At a late meeting of the Academy of Sciences, in this city, Mr. F. Gutzgow said, referring to the belief expressed by members at the previous meeting as to cases of tin poisoning, which had been reported, of persons who had eaten of canned provisions, that he had investigated the matter and found that the poison did not come from the lead in the alloy of the spurious or base tin of which the cans are made. The amount of lead that is taken in solution by the acids is too infinitesimal to be injurious, and besides it is precipitated in the solution. The poison must be from other causes or sources.

SNAKE POISONING.—Sir Joseph Fayrer, who has been investigating snake poisoning, says that to him one of the greatest of mysteries is that a poisonous snake cannot poison one of its species, scarcely its own congeners, and only slightly any venomous snake; but it kills innocent snakes quickly. A vigorous cobra can kill several dogs, or from a dozen to twenty fowls before its bite becomes impotent, and then the immunity is of slight duration, for the virus is rapidly re-secreted.

LIGHT AND HEALTH.—Investigations concerning the effect of different forms of artificial illumination on the health have shown that the tallow candle is the most unwholesome agent, and the eclectric light the best. The incandescent electric lamp produces only about 1-30 as much heat as the tallow candle, while it gives out no carbonic acid or water. One gas jet in a room is said to vitiate the air as much as six persons.

POISON IN ICE CREAM.—It should be more generally known that aniline colors are used in giving tints to ice cream; more particularly to raspberry cream. These aniline colors are used also, the world over, for coloring wines and some other kinds of liquor, and they are dangerous poisons.

MINING SUMMARY.

The following is mostly condensed from journals published in the interior, in proximity to the mines mentioned.

CALIFORNIA.

Calaveras.

WEST POINT.—Cor. Calaveras *Chronicle*, July 26: Rich rock has been struck in the south level of the Scorpion mine, which shows plenty of free gold. The rock is about fifty ft distant from the ore chute which the level is being run to tap. The Blazing Star mine is turning out splendidly. Width of vein, 2½ ft. The owners are satisfied that they have a first-class property, and are going to work it with the necessary machinery. Levels are being run on the old Henry mine, which show a splendid vein of quartz from 14 inches to 3½ ft in width. The south level is in a distance of 150 ft and the north level 30 ft; good rock all along; ore on the dumps, 60 tons; 30 tons in mill which is kept running day and night. The Bismarck mine is turning out plenty of rich rock, and the arastra mill of Schmidt & Co. is kept busy grinding it. Width of vein, 2½ ft; owners, Mentzel & Co. The Lockwood mine is being prospected by Messrs. Russell, Schrives & Co. Mr. Haskins is opening up the Mitchell mine by tunnel and shaft. We understand that the Billy Williams mine, at Skull Flat, is going to start up shortly under the sway of Messrs. Rowe & Jenkins. The mine paid well in former years. The Lone Star mine has been turning out some more of its bullion. There are about thirty tons of ore in the mill, which will average $130 per ton, and plenty more of the same kind in the mine. Bullion product since our last report: Novella mine, 5 tons, $140; Widows mine, 5 tons, $500; placer mines, $632.

El Dorado.

AT WORK.—Mt. *Democrat*, July 25: The Melton brothers and Day have commenced active operations at the Day mine, near Grizzly Flat, and we may soon expect to hear of a new "Grizzly boom." Some fine nuggets of gold bave recently been found at the Stephens mine, near Texas Hill, some of tbem weighing over two ounces.

CRYSTAL MINE.—At the Crystal mine, in Mud Springs township, they have all the machinery on the ground for adding five more stamps to the mill; also two new concentrators, two Pelton wheels (one for the stamps and the other for the concentrators) and a quantity of sixteen-inch pipe. This looks like business.

GOOD NEWS.—On Wednesday last, while the men were grading to get a foundation for the new blacksmith shop near tunnel No. 2 of the Melton mine, Grizzly Flat, a new chute of ore was unearthed, which prospects splendidly. Several tons of the ore has been taken out, which looks better than tbat taken from near the surface at any other point. Everything of late seems to indicate that Superintendent McClellan has a better mine than even he himself had hoped for.

Inyo.

WILD ROSE DISTRICT.—Inyo *Independent*, July 26: A revival of industry is manifest at the mines of the Wild Rose district. Messrs. W. K. Miller, J. M. Keeler and N. J. Medbury have been taking ore from the Mohawk, Blue Bell and Argonaut mines, formerly known as the North Star, Garibaldi and Nellie Grant. A shipment of ten and one-half tons of ore was lately made from the mines to the Snow's Canyon mill, and worked. From this the proceeds were four bars of bullion, weighing 3,400 ounces. Most of this is silver, but as no facilities for assaying are at hand, the exact value cannot be given till returns sball be had from San Francisco. The credit of this work is chiefly due to Mr. Miller; he had the ore taken across Panamint Valley, thirty miles, to the mill, in order to prove its value. From the result of this experiment, it is easily seen what wonderfully rich results would be produced by a mill close to the mines, where there is an abundance of wood and water. M. G. Nixon has bought the Freeborn Canyon mill and mines, and expects to have a force of men at work by August 3d. We can now look for this mill to produce regular monthly shipments of bullion as in former times. The mines at Chrysopolis are now to be worked vigorously. Superintendent Bolinger has put a force of men to work and will develop the mines as rapidly as possible. S. A. Densmore has leased the San Carlos mines to J. M. Keeler, wbo will put a force of men to work on them next Monday.

BEVERIDGE BRIDGE.—The bridge across Owens river at Beveridge that was impassable lately is now in thorough repair. Through the energy of Road Supervisor Palmer all damage has been repaired.

Mono.

RICH STRIKE.—Bodie *Free-Press*, July 23: Considerable excitement was created yesterday when it was ascertained that an exceedingly rich strike had been made at Sweetwater in the California Comstock, a mine that has been prospected quietly for several months past. Parties interested were anxious to perfect their title to some of the adjoining claims and had kept the strike secret from the public. The porphyry belt of Patterson district is about seven miles long by four miles wide; lies between the East and West Walker rivers and is on a separate or distinct range of hills—entirely independent of the Sierras. The country rock is composed of dark gray syenite. At the extreme north end of the belt copper appears mixed with a small percentage of silver. The California Comstock is situated about two and one-half miles west of the Kentucky and on the apex of a hill, where the shaft was sunk; the mineral belt is mapped out to the northward by the North Comstock, First North Extension, Great Western, Lookout and Star locations. In the other appears the Huntoon and Geneva. The shaft of the mine in question is at an elevation of 11,090 feet and was sunk only about 35 feet. It showed an ore body 25 feet wide where it was stripped which averaged an assay of $50 per ton of silver with four per cent of gold, free milling. A streak of six feet in width in the same went into the hundreds. About three feet of debris was removed in stripping the ledge. The tunnel is situated about 300 feet below the shaft where only 8 feet was run before the same ledge was encountered. This is what constitutes the strike as they have cut 10 feet into solid free milling ore which will average, according to fair estimate, $70 per ton. The hill is very steep, over 45 degrees, and the ledge dips in such a manner that it comes nearly to the surface where the adit is run. They have 150 tons of $75 ore on the dump and with that of inferior grade it measures about 2,000 tons. Experts claim it is the biggest milling proposition outside of Virginia City. The owners of this bonanza are as follows: A. Snyder, Geo. Courtnage, Ed. Reading, Harry Wilcox, A. Soderling, W. Trudgeon, A. Anderson and Alex. Stewart.

Nevada.

SNEATH AND CLAY.—Nevada *Transcript*, July 26: The Oneida, Chief S. M. Co. has received a United States patent to the Sneath & Clay quartz mine, which is situated on Gold Flat, near the railroad trestle. We are not advised as to wbo compose the above company, but believe the property in question belongs to Eastern parties. Years ago the Sneath & Clay was remarkably rich and it is tbe opinion of many mining men that there is plenty of good rock there yet.

Plumas.

COARSE GOLD.—Plumas *National*, July 26: From the new strike on Hopkins creek, the gold is coarse, and tbe rock is filled with it in such a way that there is no room for doubt that a very important discovery has been made. The first location made is named the American and extends 500 ft one way from the creek, and 1,000 ft the other. The ledge shows about 4½ ft in width, and the rich prospects spoken of are found directly in the bed of the stream. This is owned by Hersem, Haines and others, of Onion Valley. Four other locations have been made, and we believe they all sbow the ledge in good shape. Those who have been on the ground consider the prospects for a prosperous quartz camp very flattering, and much work in development will soon be done.

Siskiyou

FORKS OF SALMON.—Yreka *Journal*, July 25: The mining season is approaching a close for tbis season. McNeal & Co. have just shut down piping and are engaged in cleaning bedrock. Hugh Grant is still running his pipe, and has had, I believe a very successful season.

PICK AND PAN.—Yreka *Journal*: Kittlewood and Company below the mouth of Scott River have just finished tbe construction of their head dam. Mapleson and Company, also below the mouth of Scott river, are working away under the most favorable circumstances. Tim Austin and Company and Barton &Co., on the Klamath are very well satisfied with the outlook and are putting in full time. Kohl and Mott on the Klamath are putting in new wheels and will begin operations as soon as completed. Jackson and Crary above Oak Bar are working a full force and expect a good yield. Doggett and De Mora are making big money in their claim near Oak Bar this season. The Big Joe Company on the Klamath are experiencing some trouble with their pumps which has somewhat delayed work, but expect to have everything in good shape in a few days. All the China companies on the Klamath are doing well as usual. The Fort Jones Company are having a profitable run, gold being discernable in the gravel. Two hundred and thirteen ounces were taken out in eight days, not long since. The Empire Bar Co., are working within ten feet of bedrock, which they expect to reach shortly when they will find big pay. The Centennial Co., are working the surface at present and are making expenses. As soon as they get down to bedrock they will encounter rich gravel. The Kanaka and Freshour Bar Co's have just commenced work. Both of these claims have paid handsomely in the past. The Lime Gulch Co., are running a prospect drift and are encouraged by the appearance of the dirt. Wm. McConnel in his claim is putting up a second derrick. He has been baving same trouble with his electric lights, the battery not being strong enough to run both, but one works in a perfectly satisfactory manner. The claim still continues to pay largely. Magoffey Brothers on Scott river are doing well. Garretson & Co., at Quartz Hill have had a profitable run. In the San Jose claim a cut is being made to the main channel. Martin Andrews has moved considerable dirt this season, and will make a big clean-up. He has a 400 ft. pressure of water. Mr. Hetchel has discovered a good quartz prospect above Scott Bar. He found native quicksilver in the clay gange. W. W. Eastlick and brother at Oro Fino have closed for tbe season with satisfactory results. In fact, the claim paid well, considering that they were not down to bed-rock. R. H. Campbell & Co., in Quartz Valley are cleaning bed-rock; will finish up in two weeks. We learn that they have already secured nearly $50,000 and the sum will no doubt be swelled to $75,000 at the wind-up. Expert miners, who have opportunities for knowing, claim that the clean-up will not fall short of that amount. Wright and Fletcher have cleaned up in their claim at Oro Fino and are well pleased with tbe returns. They enjoyed only a short run but an exceptionally good one, taking out more dust than they ever have before in the same length of time. They prospected some dirt which paid all the way from an ounce to $25 per pan. Mr. Wright is now in Weaverville looking into the merits of a new elevator and if it works to his satisfaction one will be placed in the claim in which he is interested at Oro Fino. Their claim is one of the richest in the county and both being practical miners, it is operated to the very best advantage. They have sufficient ground to last for the next 50 years notwithstanding that it is worked upon a large scale.

San Bernardino.

CALICO DISTRICT.—*Print*, July 26: The various mines in Calico district are constantly improving by developing, and none which we have seen show any signs of petering out. East Calico district especially is developing some very fine properties, and somewhere in Oriental canyon we expect a town to spring up that will vie with Calico. Near the Bismarck mine about 250 men are working. The Garfield mine keeps holding its own, although nothing can be learned from the managers—everything in and around the mine indicates prosperity. The new tunnel started a few weeks ago is now in some three hundred feet, and a tunnel to meet it has been started on the west side of the Occidental hill, and is pushed forwarded rapidly. It is predicted by expert mining men that a large body of ore will be struck in tbis tunnel much richer than any which has yet been discovered. The Garfield property is the richest in Calico district, and we have yet to learn of its best days. The chloriders on the Occidental ground are rapidly changing that property to one vast mine. The largest part of the men who have chlorided there have made money and are now taking out some very rich ore. The royalty already paid Mr. Raymond by the lessees of the claim amounts to $6,000, within $2,000 of the first cost of the entire property. This shows how the Oriental Co. have spent money in Calico district. The Bismarck mine retains its force of 20 men, and are hauling their ten tons of ore each day to the company's mill at Hawleys. The Bismarck mine has a mammoth body of ore in sight, and we learn from tbe Superintendent that it will take two years at least to work it out witb a large force of men. The force will be increased about October 1st, to about 60 men, if better facilities are secured for the quicker reduction of large quantities of ore. The Blackfoot mine and Sam Houston No. 3 are being worked by R. B. Johnson. He has six men employed. The ore is in large quantities, but the assay value is not high, although it will net well after being worked. A shipment will be made in a few days to the Sampling Works, and a large force of men put on in the course of a week or ten days, as there is plenty of ore in sight and easily worked. The Snow Bird mine is working six men, and is shipping some very fine ore to their mill. Mr. Sinclair claims he works his ore closer than any other mill, and makes very low grade rock pay. The mill employs eight men, and is working night and day, running through between six and seven tons of ore each day. The Lyon claim is being prospected by Dr. Ghiselin. Some very good ore has been taken out, and has every indication of being a valuable piece of mining property. A fine body of ore has been struck in the Maiden claim owned by Messrs. Stacy and Raymond, and it promises to develop into a fine ledge of mineral. The Cuba mine owned by Lieut. Gov. Gaggett is being rapidly developed. About 25 men are employed, and ten tons of ore is the daily shipment. A great deal of the ore is bigh grade, and does not require very close sorting.

Sierra.

EXPRESS.—Sierra *Tribune*, July 26: The Express M. and M. Co.'s quartz property embraces three locations—the Meadow, Star and the Golden Cross, situated on Butcher Ranch ridge, about three-fourths of a mile from Hog canyon. On the Golden Cross claim a shaft has been sunk to a depth of 75 ft, encountering an eight-foot vein. From the bottom of the shaft a tunnel has been started into the hill, which will eventually tap the ledge at a distance of 300 ft below the surface. Another shaft has been sunk 40 ft on the Meadow ledge. This is a north and south vein and averages about five ft in width. In the bottom of this shaft a second ledge, measuring 4 ft and 7 inches, was uncovered, running east and west, or at right angles with the Meadow vein. Work is also progressing on two drain tunnels which will be run 120 ft. Mr. Mead expects to have these completed in about six weeks. Practical miners give very favorable reports of the various prospects being operated upon in that vicinity. The ledges mentioned above are ranked among the most prominent of these, and from all accounts the owners have no reason to feel discouraged with the prospect as far as they have gone.

STRIKE IN MOHAWK.—Sierra Valley *Leader*, July 23: Quite an important strike in the mining line is reported from Mohawk. Mr. Black and John Poe are working on the ledge, on which they have drifted a distance of 25 ft from the foot-wall and the hanging-wall has not yet been reached. The rock is said to prospect well for the whole distance. In a specimen which is on our desk, go'd in considerable quantity can be plainly seen. It is the intention to erect a mill on the ground this season.

Tuolumne.

OAKLAND MINE.—Tuolumne *Independent*, July 25: This mine is about three miles east of Columbia, and adjacent to the celebrated Arnold, Rifle, Smoothbore, and a number of other valuable mines. What is now known as the Oakland mine embraces several locations originally made along the vein or veins, within the limits of said claim, to wit: Auburn, Little Ida, New York and Oakland, and is undoubtedly in all as valuable a piece of mining property as there is in the county. The company commenced the opening out of the mine something over two years ago, which has been an up-hill business. But past experience has taught the company a good lesson, wbich it will "remember by-and-by," and now a new era in the management of its affairs, pertaining to the working of the mine, based upon the most practical methods, is the result. A new stamp mill has just been put in place on the mine, in connection with all the most improved machinery for concentrating and separating, and was started up two days ago, working to a "charm" and giving perfect satisfaction in all its parts; and, furthermore, which is still more encouraging, the plates already exhibit a big showing of amalgam. Captain W. E. Bushnell, Eli Denison, J. Massey and D. West, all connected with the C. P. R. R., are the principal shareholders, and three other prominent business men of Oakland, whose names we were unable to obtain at the time, constitute the company. An offer of $100,000 has been refused by the company for their mine. The practical testing of the mine, as to whether the vast bodies of ore that may be cheaply extracted from it will yield, on the whole, a good profit through the ordinary milling process or not, will be tbe means of determining, to a great extent, the value of undeveloped mines located in the same belt. On the whole, the outlook of this mine, at the present, is beyond the most sanguine expectations.

NEVADA.

Washoe District.

SIERRA NEVADA.—*Enterprise*, July 26: Since last report no work has been done in west crosscut No. 4, on the 3100 level. Opposite this crosscut has been started, east crosscut No. 1, which was yesterday out 12 feet. The rock is about the same as that in the drift from which the crosscut starts. These crosscuts are at the extreme north end of the main nortb drift, where no diamond drill holes have been made. The ground is quite dry. Work has been resumed in west crosscut No. 3, 300 feet north of the joint Sierra Nevada and Union Consolidated winze. The crosscut is now out 25 feet. It is in vein material of about the same character as that passed through by the main north drift. The joint Sierra Nevada, Ophir, Mexican and Union Consolidated winze, below the 3200 level, has been sunk and timbered eight feet. It is still in the bastard quartz formation, with some porphyry coming in. As yet this porphyry is in the shape of detatched masses or bunches.

HALE AND NORCROSS.—Work has been resumed on the 2800 level in the way of cleaning out the drifts and preparing to advance that running northward. Though the blowers have been set up and the air pipes connected, it is still pretty hot, except immediately about the ends of the pipes. Drifting will probably be commenced to-night or to-morrow. The blowers will furnish such a supply in the face of the drifts as will enable the miners to work in comfort. During tbe past week over 400 tons of ore were extracted and sent to the mills. The sum of $14,000 has been received as a partial return from the Eureka mill on the July account.

UNION CONSOLIDATED.—The only work being done at present is jointly with the Ophir, Sierra Nevada and Mexican, on the 3200 level of that company, in the winze which is designated to explore the north end of the Comstock to the depth of 3300 feet or more. Work in this winze is progressing steadily.

BEST AND BELCHER.—On the 2500 level the joint Gould and Curry west drift is making about 40 feet per week. It is now in softer ground than heretofore, and is showing some quartz feeders of a favorable appearance. The joint Consolidated Virginia west drift is being advanced at the rate of over 30 feet per week in vein material that sbows stringers of quartz.

OPHIR.—The new west drift on the 500 level is out about 30 feet. It is in ground that blasts very well. Some ore is still being obtained on the 250 level by taking out and assorting the filling of the old drifts. The work being done jointly with several other north end companies in sinking the deep winze on Mexican ground is progressing favorably.

MEXICAN.—The winze on the 3200 level, which is being sunk jointly with the Ophir, Sierra Nevada and Union Consolidated companies is now making fair progress. An increased amount of porphyry is met with, but it is still in detached bunches, the mass of the material being a bastard quartz tbat does not blast well. The winze will be sunk and timbered about eight feet this week. There is a small flow of water which the pumps easily handle.

GOULD AND CURRY.—The joint Best and Belcher west drift on the 2500 level is now being advanced at the rate of about 40 feet per week. Some promising quartz feeders have been cut through and the porphyry is becoming softer. The drift is now out nearly 300 feet.

CONSOLIDATED VIRGINIA.—Water having made its appearance in the main south drift on the 2900 level, the diamond drill has been put into the face, and is being sent ahead to explore the ground, which gives signs of being very wet. Drill holes have been run in several directions from the face o the drift.

ALPHA CONSOLIDATED.—The north drift is now out about 545 feet. It is going a little east of north, and has shown up a large quantity ot quartz. Until recently this quartz has been barren; now, however, it is beginning to give assays of a few dollars, indicating that further north a body of paying ore will be found.

CHOLLAR.—Good headway is being made in the main south drift on the 2600 level. It is in vein material that sbows frequent streaks of quartz and seams of clay. All the machinery at the Combination shaft is running smoothly, as also is all the pumping apparatus.

ALTA.—The diamond drill is being run east on the 2150 level. Drifting bas been resumed in the west drift on the same level, and the belt of fertile ground passed trough by the diamond drill in that direction will be thoroughly explored.

ANDES.—The winze is now down about 50 feet. It yet has between 20 and 30 feet to go to tap the vein. The material is unchanged. The north drift is still in porphyry, with streaks of quartz of a favorable appearance.

YELLOW JACKET.—The usual quantity of ore is being extracted and sent to the Carson river for reduction. Considerable prospecting is being done at various points.

UTAH.—The southeast drift on the 1050 level has been advanced 28 feet during the week. It is at present in vein porphyry that shows streaks of clay.

CROWN POINT.—The mine is yielding the usual quantity and quality of ore, keeping the mills on the Carson river in constant operation.

CALIFORNIA.—The work here is joint with Consolidated Virginia, which see.

Columbus District.

MOUNT DIABLO.—*True Fissure*, July 26: The north drift from winze No. 5 is in 27 feet, and has cut two small seams of ore of good grade. The raise from the east drift on the third level is in 20 feet, and shows ledge matter with a little low grade ore. The west intermediate, between the second and third levels, is in 120 feet, and shows some 18 inches of $60 ore. The east intermediate, between the first and second levels, shows a small ledge of $60 ore. A small amount of ore has been taken from the east drift on the third level during the week. The west drift from the fourth level has been driven 8 feet, and shows ledge matter in the face. Work has been resumed in the fifth level, and the east drift is being driven to connect with the incline.

Sherman District.

ENCOURAGING OUTLOOK.—Reno *Journal*, July 23: Jim Burke has resumed work on his mine in Sherman district. The bottom of the shaft last Saturday was in soft, decomposed quartz, containing considerable black sulphurets. The ore very much resembles some of the rich quartz taken from the Con. Virginia. Mr. Burke is very much elated with the prospects. When the shaft is down 100 feet, drifts will be run north and south on the ledge.

Lexington District.

PROSPECTING.—Cor. Piute *Record*, July 23: Utah parties from the East have lately visited Lexington Canyon for the purpose of investigating and prospecting that section, and I learn, from a reliable source, that everything was very satisfactory, and Mr. Eppley had gone East with the parties to close tbe sale. This insures the building of a mill in that camp, and active operations generally.

Taylor District.

GENERAL NOTES.—Cor. Pioche *Record*, July 19: I should judge it to be a very dull camp, and a good place for those in search of employment to remain away from. The Monitor is undoubtedly a good mine, and is paying its lucky owners—who, by the way, are hardworking industrious miners—a handsome monthly dividend. The ore is free milling, and, as I have been informed, assay 150 ounces per ton. Some 30 men are employed in the mine, and more would be put on but that there is a surplus of ore at the company's mill. The Argus is distant some four or five hundred feet up the hill, and is also a valuable property. At the time of my visit there was only 20 men on the pay-roll, the company having laid off some 14 men a short time previously, but I was informed that they were being put on again as fast as there was room made for them. So much for a very limited knowledge of the camp. Taylor, however, is a pretty little camp, being located about 1,000 feet above the valley among the pine and cedar trees.

TAYLOR NOTES.—Cor. Eureka *Sentinel*, July 26: The Argus Company paid off its miners on the 15th and made times lively for a few days. The Argus Company settled with Wm. Warrener, the man who got hurt while at work in the Monitor blacksmith shop by a rock blasted from the Argus mine. He was given $1,000 in money, and had his doctor's bill and other expenses paid since the accident last January, some $950. There is some talk of Mr. Carothers opening up some more of his mines in Taylor District.

Osceola District.

THE CAMP.—Cor. Pioche *Record*, July 19: Finding the camp rather quiet, I departed at 10 P. M. for Osceola. Osceola is at present very dull in consequence of the water giving out. As I write there are only five men chloriding in the gulch, and by the time this reaches you there will be six. There has been considerable work done here this past spring, however, but few have made any money notwithstanding all letters from this place to the contrary. This is due to the fact that most of the ground gone over had been worked before, the large gravel deposits, of which there are some 700 acres, being owned by Messrs. Godbe, Hampton and St. Perrie. This company has been busily engaged here for the past five weeks in prospecting said deposits, and after a little over four weeks' labor in washing, cleaned up the snug little sum of 198 ounces in gold. They realized from one pit of 3,000 cubic yards, 104 ounces, or an average of 55 cents to the cubic yard. In this pit was found a nugget weighing 16½ ounces. Another pit on the upper end of the same gulch panned out at the rate of $1.15 per cubic yard. The company, although doing very well, were under heavy expense, because in prospecting from one place to another they had to cut ditches, build dams, etc., whereas if they handled, all their water on one piece of ground, with a large nozzle, they could have accomplished ten times the labor. In conversation with one of the firm recently he said that the test was highly satisfactory, proving conclusively that there was millions upon millions in the large gravel deposits, if there was only water to take it out. When asked if there was any truth in the rumor that the company intended laying pipes with a view towards bringing water to camp right away, he answered: "No, but that they intended doing so as soon as sufficient funds were raised for that purpose."

Esmeralda District.

AURORA'S PROSPECTS.—Walker Lake *Bulletin*, July 26: Favorable reports still come from Aurora. The mines now being worked belong to a class which has, until the last two years, attracted but little attention. They yield low-grade ore, which, in former years, was not considered worth working, but now, with better appliances and greater experience, they are being worked profitably and are developing into exceedingly valuable properties. These mines are wide, plainly developed lodes, in which the mineral is more generally diffused than it was in the veins heretofore worked in this district, and, so far as developed, they gradually yield greater returns as depth is attained. But this development, though extending over a period of something more than two years, is even yet extremely limited, owing to the need of capital by the owners of this particular class of veins. On none of these mines has there been any working at a greater depth than 100 ft, if so deep as that. The ledges have been carefully crosscut and levels run at various depths, which, although not opening the mines sufficiently to admit the working of a large force, proves that at no distant time mining will be carried on to a greater extent than ever, the class of property being such as to warrant extensive plans and assure a long continuance of profitable work. That such is the case is shown by the frequent visits of capitalists and the deep interest they take in the situation. Those well able to form a correct judgment as to the future are making estimates as to the cost of railway connection of the mines with large water facilities, where cheap reduction of the ores can be obtained. Such a project would not be entertained except with the knowledge of many years of production, as the original cost would be too great to be justified by the short life of the ordinary mining camp.

Tuscarora District.

ARGENTA.—Times *Review*, July 24: South crosscut on the 400-foot level is in 175 feet; ground still very hard.

NORTH BELLE ISLE.—Work on the 70-foot level has been suspended during the past week, to permit of some improvements being made in the ventilation.

INDEPENDENCE.—There is no material improvement. The usual progress has been made with the work on the 300-foot level.

NAVAJO.—The joint Navajo and Belle Isle line crosscut, 150 level, has been advanced 8 feet; total length, 23 feet. Good progress is being made with the work at all points, and the usual amount of ore is being extracted and sent to the mill—some of it from the chambers in the foot wall of the west vein, and a part from the 250-foot level stopes on the east vein. Average battery assay for the past seven days, $185.76; workings, 92%.

Safford District.

ASSURED FORTUNE.—Eureka *Sentinel*, July 25: Col. Joseph Tyson, of Safford, who is in Eureka, tells that he regards the future of that camp as better assured now than ever. The contractors working in the Onondago have just completed a tunnel, 522 feet in length, tapping the mine 230 feet below the surface. This is the chief mine there at present. Who will own it is now the question, owing to the claims of Ben Safford's heirs, who are legion. Until the ownership is settled, everything else will be held back.

Paradise District.

THE MINES.—*Silver State*, July 22: L. H. Morse and H. B. Luther, who arrived from Paradise yesterday, say the mines are looking well. A force of men is employed on the Bullion mine taking out ore, and that mine, as well as the Wild Goose and Paradise Valley, is producing rich ore.

ARIZONA.

THE QUIJOTOA STRIKE.—*Epitaph*, July 23: W. H. Smith Supt. of the Peerless mine writes as follows to the Secetary of the company: All work in and about the various mines is being pushed ahead with due energy, and better progress has been made since putting in the fans. Peerless tunnel No. 1 is in 227 feet. The former contractors have finished their contract and a new contract has been let out, better progress will be made in the future. Crocker tunnel No. 4 is in 227 feet. This tunnel has been advanced nearly 40 feet since cutting the vein. The face is now in fine looking quartz, showing assays from $20 $150. Quite a cave or opening has been encountered during the week, showing fine ore and regular stratification. From the general appearance it shows a vein of great strength and magnitude. Crocker No. 5 is 79 feet. Face of drift to-night is coming into quartz. The winze is down 134 feet. South drift from tunnel No. 2 is 126 feet, and is showing some fine ore. A crosscut has been started in this drift to run east to cut the front vein. Peer tunnel No. 3 in in 252 feet. The face is in much softer formation than at any previous time since the tunnel has been started, and is looking very favorable, and from general appearances, I think the vein will soon be encountered.

COLORADO.

MILL RUNS.—Georgetown *Courier*, July 23: The Georgetown tunnel will cut the Sonora in about 30 ft. It makes one's eyes glisten to see the native silver coming out of the Tishomingo. One and a half tons of ore from the Little Giant lode, Red Elephant mountain, returned $676. A earload of ore recently shipped from the Ann Eliza lode, at Chihuahua, returned $4,000. Brophy & Co., on the Scotia, had a mill run of ore last week, which went 126 ounces silver per ton. Snyder & Co., lessees on the Coin lode, had a mill run of 2,600 pounds of 160-ounce ore last week. A mill run of ore from the Gray Eagle, at Chihuahua, worked by George Dinsmore & Co., returned nearly $8,000. A run of ore from the Jordan lode, on Democrat mountain, of 7,814 pounds, returned 116 ounces silver per ton. Swanson & Co., lessees on the Rogers, brought down a lot of ore last week, which milled 179 ounces silver per ton. The Barrett & Fletcher mill, at Empire, is running on a full supply of ore from the Tom Benton, California, Livingston County and Pittsburg lodes. McNulty & Co. intend working the Fred Rogers through the Junction tunnel. They will run on the Rogers vein and connect with the engine shaft. Work will commence this week. Frank J. Hood and Chas. W. Steele have a lease and bond on the Snowden lode, on Griffith mountain. This lode is undeveloped except by three surface workings. A lot of 43 pounds of unassorted quartz milled 143 ounces silver per ton. A mill run from the Stevens mine, made last week, gave the following results: First class, 138 ounces silver and 54 per cent lead; second class, 89 ounces silver and 26 per cent lead. The whole lot, consisting of 39,820 pounds, returned $4,240. The Clifford lode, on Democrat mountain, near the Astor, owned by Fred Candee & Co., is being worked by an adit, which is now in 25 ft. In the breast is shown an average of two inches of ore which assays as high as 2,390 ounces silver to the ton. Captain J. F. Phillips is driving an adit on the Tom Benton vein, at Empire, which has reached the old Shawnee shaft, which he is clearing. There is already exposed a vein of quartz, three ft wide, which runs four ounces in gold to the cord, under stamps. The *Gazette* says that one of the most important strikes that has taken place in that vicinity is that in the Gem mine, on Seaton mountain. It is stated by the owners that they have exposed a large body of from 10 to 12 inches, nearly solid gray copper in the lower workings. Carothers & Keaggy had a run of ore last week from a new strike made by them at Lawson. The ore returned, first-class, 802 ounces, and second-class, 317 ounces silver per ton. This was taken from a prospect hole, ten ft deep. The owners have christened it the Orient.

IDAHO.

BULLION.—Wood River *Times*, July 23: Bullion, which the *Times* very appropriately named "The Backbone of Wood River," three years ago, still deserves that appellation. At the present time its mines are in better condition than ever before, and probably show more ore value than the balance of the mines of Wood River combined. In the bullion there is an ore body that will in all probability and estimating moderately, net over $2,000,000; in the adjoining Ophir claim there is also an ore-body that promises still better. The Mayflower, which adjoins the Bullion on the north, is also showing up more magnificently than ever. The O K vein, which runs parallel with that just mentioned, is in shape to yield large quantities of ore. The Mountain View, owned by Mose Hirschman, Barney Quigg and Judge McBride, is just beginning to make a record that will be second to that of no other mine. The Valley View bard by, and owned by Colonel Pettit, of Atlanta, Frank P. Cavanah, A. J. Haffaker and William Irvine, is also making a good showing. The Eureka, owned by Colonel Wall, is about to have new concentrating and hoisting works, and, six weeks hence, will be yielding all of 10 tons of ore per day. The Idahoan, on the same vein, bas over half a million dollars' worth of ore in sight. The Bates & Boyd shows up over $100,000 worth of ore, gross; and the owners recently refused $60,000 cash for the property. The Bay State, French Boys', and Lawrence & Reilly groups, on the Divide, have good bodies of fair grade ore. And the Narrow Gauge and Bannack group, just over the Divide, is yielding steadily, the jigs working regularly. Taken all in all, Bullion is doing splendidly this year, and will make a brilliant record. Only about 250 miners are employed there now but by the first of September that number will be at least doubled, nor will this increase be temporary. The Bullion mines and concentrating works are now so situated that the season of the year makes very little difference with them. Next winter there will be more men at work, in and around Bullion, than now. "The Backbone" is therefore on the eve of a boom, and a good one, based on the development of the mines and their probable steady yield.

MONTANA.

THE CAPACITY TO BE DOUBLED.—*Inter-Mountain*, July 26: An interview with Mr. Daly, superintendent of the Anaconda Company's works, elicited the information that extensive improvements and additions are to be made to the already mammoth plant of the company in the upper Deer Lodge valley town. The exact nature of the improvements has not as yet been decided upon, but sufficient is known to warrant the statement that the productive capacity of the works will be almost doubled. Mr. Daly will visit the works to-morrow and the matter of the contemplated addition will receive his attention. Much will depend upon the character and amount of the product of the present furnaces, and it is not likely that the additional works will be commenced until it has been fully determined by careful experiment whether reverberatory or blast furnaces will best treat the ore furnished by the mine.

THE BELL SMELTER.—*Inter-Mountain*, July 24: For several months past the Bell smelter has been doing good work. During the month of June the amount of ore treated daily, only one furnace being in operation, averaged 37 tons, or a total of 1,110 tons. This very considerable amount of ore was largely taken from the 400 foot east level of the mine, where it is understood a fine body of excellent ore was uncovered last spring. A considerable part of the ore worked in the smelter is first concentrated in the old Longmaid works, just south of the depot, and goes into the blast furnace with very little gangue. Next month it is in contemplation to run the two blast furnaces, and the daily capacity will then be about 70 tons. The smelter contains two calcining furnaces, each with a capacity of about eight tons. The rest of the ore worked in the blast is desulphurized by heap roasting, which eliminates about 80 per cent of the sulphur. At present the smelter is closed down for repairs, after a long and continous run. The amount of roasted ore on hand at present is not large, though it is stated that when operations are resumed in a few days, 1,000 tons of calcined ore will be available for reduction.

NEW MEXICO

GENERAL NOTES.—Silver City *Enterprise*, July 14: The Williams brothers' patent improved Baldwin hoist has arrived and work will be pushed forward with rapidity upon the Nugget claim in a short time. A contract to do twenty-five ft of work was let upon the Doc Handy mine, in Pinos Altos this week. Another dividend of fifteen cents per share, amounting to a total of $60,000, payable July 15th, has been declared by the Sierra Grande mining company, of Lake Valley. The smelter and reduction plant in this city is now nearly completed. It can be made ready for business in a very short time after the vanners arrive, which are detained by the washouts. The mines belonging to the Plata Verde Mining Company, in Shingle canon, near Georgetown, will be worked in a few days. There are large bodies of low-grade ore in these mines and with a market for it, as is at present afforded the Georgetown mine owners, the property could be made to pay. From all reports the new strikes in the neighborhood of Gold gulch are of considerable magnitude and value. On Saturday evening last on a property in which Cab Conway is interested, a shot was put in which blew out a solid chunk of ore weighing about five hundred pounds, which was fairly "lousy" with horn silver. The owners expect to ship a carload of ore in a few days, and if it comes up to their expectations, regular shipments will be continued after that date. During the past few days development on the Old Man mine at Fleming has been steadily progressing. The ore seams in places have not been as large as nearer the surface, but the grade is much the same. On Tuesday last the seams in the open cut, east side, widened materially, as did the bodies in the other openings. It is the general opinion of persons who have visited the Gold Gulch and Thompson Canon discovcries that they are promising prospects, and will pay big to work from grass roots. The claim in litigation there is said to be very rich in silver and carries some gold. On the Atlantic mine, in Pinos Altos, a four-inch vein of $40 gold rock was discovered by the owners recently. On this mine, which has been prospected and worked for years, there are four distinct veins which traverse the claim from end to end, and which have in the past yielded many thousands of dollars to their owners. Recent development has done much to improve the prospects of this particular group of mines. Robert Kirk, an old and well-known prospector, discovered ore last week at the head of Arroya Questa, about one mile south of Pinos Altos, that may prove to be a big thing. The ledge on top is fourteen inches in width, and average assays give returns of seventy-five ounces in silver. It has not been tested for gold, but the ore will carry a small amount. Development work is progressing upon the property and other prospectors are locating extensions. On the adjoining claim we learn that Moore and Sims have the same mineral.

CHLORIDE CHRONICLINGS.—*Black-Range*, July 24: Jim Wilson is now at work on a fine prospect at Granite Gap in the south end of the range, in which himself and brothers are owners. Messrs. Irish and Dempsey are at work on the middle Palomas on one of the promising claims owned by themselves. McBride and Burke. Major Day reports a new discovery of ore in the Cuchillos in the neighborhood of his German mine, which he pronounces the finest thing that he has struck yet. Foster, Johnson and Nourse are putting their labor upon the Pelican at Hermosa. They are following the ore crevice into the mountain and increasing the ore dump. The tunnel is now 165 feet long. Charley Lewis and Ed. Doran two of the owners of the Palomas Cheif mine, Hermosa, are back from their rambles and are again at work on this promising property, taking out ore and sacking it for market. They had, on last Sunday, 125 sacks of ore on the dump, and the mine is reported to be looking particularly fine. The hoisting machinery for the Silver Monument mine has been lying at Engle for some little time, but owing to the height of the river flood no attempt has been made to get it out here. In a day or two, however, John McBride goes to the railroad to superintend loading the machinery on the wagons and getting the wagons across the river. Henry Westerman has taken a bond lease on the St. Cloud mine which gives him absolute possession and control of the property for one year.

OREGON.

CLEANING UP.—Jacksonville *Times*, July 25: Wimer & Sons of Waldo are cleaning up; so are Desselles & Co. Both claims are expected to pay well. John Beckner informs us that J. T. Layton will finish work for this season in a few weeks. The prospects are favorable. A. T. Johnson and Joe Brændel have discovered a promising quartz ledge in sight of town. A company will probably be organized to work it. Joe Brændel, while prospecting the bedrock in one of the gulches west of town, picked up a nugget of gold worth $17.50; also a few small pieces. One of the best developed and most promising quartz mines in Southern Oregon is that owned by George Schumpf in Willow Springs precinct. A large body of ore is in sight and recent assays prove that all which is required to make this enterprise a profitable one is capital enough to put up a good mill. Mr. Schumpf deserves success for his endeavors to advertise the mineral resources of the county.

BONDED.—Crescent City *Courier*, July 25: J. J. Aiken of San Francisco returned from Kerbyville this week. He is interested quite extensively in mining matters over the divide, and states that his company has bonded the well-known Mackay claim for one year in the sum of $25,000. They have also located two other claims, amounting in the aggregate to about 500 acres, all of which prospect well. There will have to be about 20 miles of ditching in order to put in a water supply for all the year round. He goes to San Francisco and will begin immediate preparations to commence work.

UTAH.

REVIEW.—Salt Lake *Tribune*, July 25: The week has been rather a quiet one, yet the mining activity has been fair. The receipts of bullion and ore in Salt Lake City for the week ending July 23d, inclusive, amounted to $112,708.50 in bullion, and $10,650 in ore. For the previous week the total was $111,844.43 in bullion; no ore. The canyon roads are now in fair condition, and the Alta tramway is open. So the ores may be expected to come down from the hills freely from this time onward. The output of the Horn Silver for the week was 19 carloads of bullion, $57,000, bringing the total for the year to date up to $1,324,000. The Ontario shipped during the week sixty-six bars of bullion, valued at $47,228.50. Total shipments to date for the present year, $918,082.39. The low price of lead gives Bingham rather a solemn air. A hundred tons of ordinary Bingham ore is worth $500 less to the miners than it was six months since. An improvement is expected, however, soon, when the corroders purchase their semi-yearly stocks. At present the tendency is for leasers to reduce their working forces and not crowd their work. The Brooklyn property, Lead and Yosemite are the heaviest producers in the camp, sending their ore down south of main Bingham, part of it by wagon to the smelters. The Brooklyn Company lately purchased the Revere at something like $20,000. They expect to get a bigger mine there than ever. The Ticwaukie is taking out ore 100 ft below the creek level, and has no water. Efforts are being made to open a new mine under the Winnamuck, the old ground having been pretty well worked out and the dump cleaned up. The mine turned out formerly full $1,200,000, and it is believed that such an ore body has deep roots. It has never been worked below the water level. An expenditure of $25,000 would sink a new working shaft to the vein 300 to 400 ft below the creek and demonstrate whether the vein at that depth carries paying ore. The new process of leaching at the Old Telegraph works claims to clean silver ores as by a fire assay and very cheaply. It is expected a large plant will be put in there to work ores by this process, when some of the chief mining and metallurgical men of the company shall have been out and looked over the ground. They are to be in this country shortly. Bingham may yet see more prosperous days than ever. Prof. Morton's mill is approaching completion. The Frisco Consolidated is putting up a small concentrating mill. There is talk of consolidating two or three miles of Lower Bingham gulch, incorporating and raising on Treasury stock $15,000 or $20,000 to run in a bedrock ditch and enable the ground to be worked. It is estimated that the channel of the creek for a width of say thirty ft and a length of 10,000 ft contains on an average $2 in gold dust, lying nearly on the bedrock, for each square foot, equal to $600,000. With a bed-rock ditch (tunnel) 3,000 ft long, costing not to exceed $5 per running foot, this could all be worked out to good advantage. All it requires is some one to take hold of it and do it. In many places there is an old creek channel, at a higher level than the present one, and it is from this that most of the gold has been taken out, and the general opinion as to the yield of the creek channel formed. A good deal of money has been expended in other places in the effort to get out and wash the pay dirt through shafts. But that is not the way to do it. Doubtless there is a rich harvest to be garnered out of that ground whencver it is gone about intelligently. Mr. Kerwin, long manager under Mr. Chambers, at the Ontario mine, has recently paid it a visit. He says it looks exceedingly well everywhere, and especially in the face of the eighth level, going into the new west ground. He says at that point there is two or three ft thickness of 100-ounce ore, which is good enough. Mr. Kerwin thinks it probable that there is enough ore above the tenth level to keep the mill running four or five years. It depends, of course, on how the new ground west opens up. The eighth level, now 300 to 400 ft west of shaft No. 3, and the sixth, driven 200 or 300 ft further, and an upraise from the sixth to the fifth, and a considerable opening on the fifth, comprise all the openings yet made in this new ground. They have been in ore, off and on, not, it is understood, as good as the old mine, but compared with any other mine we know of, very good indeed.

CHICAGO **FRASER & CHALMERS.** ILLINOIS

MANUFACTURERS OF IMPROVED AND APPROVED FORMS OF

MILL AND MINE MACHINERY.

Having made extensive additions to our Shops and Machinery, we have now the LARGEST and BEST APPOINTED SHOPS in the West. We are prepared to build from the Latest and Most Approved Patterns,

QUARTZ MILLS

For working gold and silver ores by wet or dry crushing. The Stetefeldt, Howell's Improved White, Brunton's & Bruckner Furnaces, for working base ores. Rotary Dryers, Stetefeldt Improved Dry Kiln Furnaces.

SMELTING FURNACES,

Water Jackets, either Wrought or cast iron, made in sections or one piece, either round, oblong, oval or square. Our patterns most extensive in use. SPECIAL FURNACES FOR COPPER SMELTING. Slag Pots and Cars, improved form. Bullion and Copper Moulds and Ladles, Litharge Cars and Pots, Cupel Furnaces and Cars.

HOISTING ENGINES Large or Small for flat or round rope. Double Cylinder Engines, from 6x10 to 18x60. This latter size furnished J. B. Haggin or Giant and Old Abe Co., Black Hills also Corliss Pumping Engines, 20x60, for Hoisting and Pumping Works, for 2,000 feet deep. **Baby Hoists for Prospecting, 4 H. P. to 6 H. P.**

Wire Rope, Safety Cages and any Size and Forms of Cars. **McCaskell's Patent Car Wheels and Axles—Best in Use.**

Principal Office and Works, Fulton and Union Sts., Chicago, Illinois. **New York Office, Walter McDermott, Manager, Room 32, No. 2 Wall St.**

Frue Ore Concentrator, or Vanner Mills.

Coarse Concentrating Works, Improved Jigs, Crushing Rollers, Sizers, Trommels, Rittenger Tables, and all other adjuncts for the proper working of Gold, Silver and Copper Ores, complete in every detail.

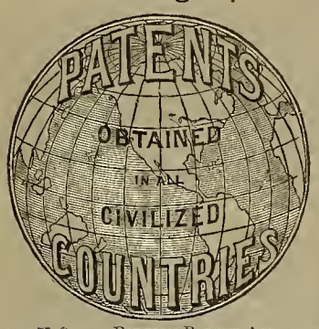
HALLIDIE IMPROVED ORE TRAMWAYS. We refer to Gen. Custer mine, Idaho, 5,000 feet long; Columbus Mine, Col., 4,750 feet long; Mary Murphy mine, Col., 5,000 feet long, all in constant operation.

LEACHING MILLS,

Improved Corliss and Plain Slide Valve Meyer's Cut-off Engines.

CORLISS ENGINES from 12x36 Cylinders to 30x60. PLAIN SLIDE VALVES from 6x10 to 36x36. BOILERS of every form, made of Pine Iron Works C. H. No. 1 Flange Iron, or Otis Steel. Workmanship the most careful. All Rivets Hand Driven.

Dewey & Co.'s Scientific Press Patent Agency.

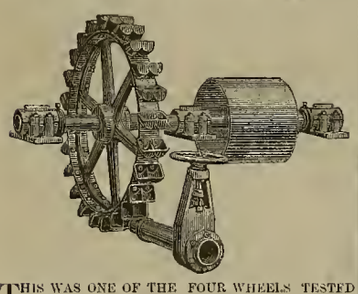


OUR U. S. AND FOREIGN PATENT AGENCY presents many and important advantages as a Home Agency over all others, by reason of long establishment, great experience, thorough system, intimate acquaintance with the subjects of inventions in our own community, and our most extensive law and reference library, containing official American and foreign reports, files of scientific and mechanical publications, etc. All worthy inventions patented through our Agency will have the benefit of an illustration or a description in the MINING AND SCIENTIFIC PRESS. We transact every branch of Patent business, and obtain Patents in all countries which grant protection to inventors. The large majority of U. S. and Foreign Patents issued to inventors on the Pacific Coast have been obtained through our Agency. We can give the best and most *reliable* advice as to the patentability of new inventions. Our prices are as low as any first-class agencies in the Eastern States, while our advantages for Pacific Coast inventors are far superior. Advice and Circulars free.

DEWEY & CO., Patent Agents.
No. 252 Market St. Elevator, 12 Front St., S. F. Telephone No. 658.

A. T. DEWEY. W. B. EWER. GEO. H. STRONG.

PELTON'S WATER WHEEL.



THIS WAS ONE OF THE FOUR WHEELS TESTED by the Idaho Company at Grass Valley, Cal., and gave 90 2 per cent., distancing all competitors. Send for Circulars and guaranteed estimates.

Nevada City, Nevada Co., Cal.

AGENTS—PARKE & LACY, 21 and 23 Fremont Street San Francisco, Cal.

NICKEL and COBALT.

For Sale

12 LARGE CLAIMS, going from 14 per cent. up to 45 per cent. Situated in Cottonwood, Churchill county, Nevada, 40 miles east from Lovelock Station, C. P. R. R., Nevada, U. S. Ore is being shipped by car-load to London, England. Apply to

GEORGE LOVELOCK,
Lovelock, Nevada, U. S.

PACIFIC POWER CO.

Room with steam power to let in the Pacific Power Co.'s new brick building, Stevenson street, near Market. Elevator in building. Apply at the Company's office, 314 California street.

HERCULES SLAYING THE GIANTS.

HERCULES POWDER

Derives its name from HERCULES, the most famous hero of Greek Mythology, who was gifted with superhuman strength. On one occasion he slew several giants who opposed him, and with one blow of his club broke a high mountain from summit to base.

HERCULES POWDER will break more rock, is stronger, safer and better than any other Explosive in use, and is the only Nitro-Glycerine Powder chemically compounded to neutralize the poisonous fumes, notwithstanding bombastic and pretentious claims by others.

No. 1 (XX) is the Strongest Explosive Known.

No. 2 is superior to any powder of that grade.

PATENTED IN THE UNITED STATES PATENT OFFICE

THE CALIFORNIA POWDER WORKS,

MANUFACTURERS OF

Sporting, Cannon, Mining, Blasting and HERCULES Powder.

ORDERS RECEIVED FOR HERCULES CAPS AND FUSE.

JOHN F. LOHSE, SEC'Y.

Office, No. 230 California Street, - - - - San Francisco, Cal.

THE CONSUMERS' COMPANY.

VULCAN B B AND AJAX.

The Best LOW GRADE EXPLOSIVES in the Market.

SUPERIOR TO BLACK OR JUDSON POWDER.

Vulcan Nos. 1, 2 and 3,

The Best NITRO-GLYCERINE POWDERS Manufactured.

SPECIAL INDUCEMENTS IN PRICES.

AJAX and VULCAN B B POWDERS are Unequaled for Bank Blasting and Railroad Work.

Caps and Fuse of all Grades at Bottom Rates.

VULCAN POWDER CO.,

218 California Street, San Francisco, Cal.

THE JENKINS STANDARD PACKING

IS ACKNOWLEDGED BY USERS AS THE BEST in the world. Unlike all other Packings, the **Jenkins Standard Packing** can be made any thickness desired in a joint by placing two or as many thicknesses together as desired, and following up joint, it vulcanizes in place and becomes a metal of itself (it is frequently called Jenkins Metal), and will last for years, as it does not rot or burn out. Avoid all imitations, as a good article is always subject to cheap imitations. The **genuine** has stamped on every sheet "**Jenkins Standard Packing**," and is for sale by the Trade generally.

For Sale by DUNHAM, CARRIGAN & CO., San Francisco, Cal.

Manufactured only by JENKINS BROS., 71 John St., New York.

DEWEY & CO. { 252 MARKET ST., S. F. / Elevator 12 Front St. } PATENT AG'TS.

Scientific, Mining and Other Valuable Books.

PUBLISHED OR ISSUED, WHOLESALE AND RETAIL, BY DEWEY & CO., MINING AND SCIENTIFIC PRESS OFFICE, S. F.

BY GUIDO KUSTEL,

MINING ENGINEER AND METALLURGIST.

CONCENTRATION OF ORES (of all kinds), including the Chlorination Process for Gold-bearing Sulphurets, Arseniurets, and Gold and Silver Ores generally, with 120 Lithographic Diagrams. 1867.

This work is unequaled by any other published embracing the subjects treated. Its authority is highly esteemed and regarded by its readers; containing, as it does, much essential information to the Miner, Millman, Metallurgist, and other professional workers in ores and minerals, which cannot be found elsewhere in print. It also abounds throughout with facts and instructions rendered valuable by being clearly rendered together and in simple order. It contains 120 diagrams, illustrating machinery, etc., which alone are of the greatest value. PRICE, $7.50.

ROASTING OF GOLD AND SILVER ORES (Second Edition) and the Extraction of their Respective Metals without Quicksilver. 1880.

This rare book on the treatment of gold and silver ore, without quicksilver, is liberally illustrated and crammed full of facts. It gives short and concise descriptions of various processes and apparatus employed in this country and in Europe, and the why and wherefore. It contains 156 pages, embracing illustrations of furnaces, supplements and working apparatus. It is a work of great merit, by an author whose reputation is unsurpassed in his specialty. PRICE, $3, cash, postage free.

Mining and Scientific Press.

LEADING MINING JOURNAL OF THE WORLD.

Established in 1860, this Journal has been eminently successful as a popular and useful mining and mechanical journal. Relative to precious metals especially, it is the leading mining paper of the world.

It is largely patronized by the leading Miners, Mine Owners, Superintendents, Engineers, Metallurgists, Chemists, Manufacturers, Mechanics, Scientific, Professional and Industrial "Men of Progress" on the Pacific Coast, and many leading Mining Men throughout the mining fields of the world.

It is by far the best advertising medium in the Pacific States and Territories for Mining, Mechanical, Engineering, Building and Manufacturing Tools and Implements, Goods, Supplies, etc.

Being thoroughly able and reliable in its editorial and business management, and long established in the most progressive industrial portion of the Union, at present, its power as an advertising medium is unsurpassed.

Subscription, $3 a year. Advertising rates, moderate. Send for samples and further information.

DEWEY & CO., Publishers,
253 Market Street, San Francisco.

To Subscribers.

While our paper is, generally speaking, very prosperous, the publishers find themselves more than usually in need of money at this time, as our expenditures are constantly large. Those who have been waiting for busy times, or for other reasons, before renewing subscriptions and making payments to this office, are now kindly urged to favor us at as early a date as possible. Also, please remember that it is a good season to suggest to others that they, too, profit by subscribing. We hope to hear from many within the next few weeks, from all along the line of our large subscription list of intelligent and appreciative readers.

Mining Share Market.

As our mining stock table show, there has been a reaction in the stock market and the "bears" are in the ascendant. Prices have been broken from their rise of last week. The fluctuations have made some little excitement on the street, to the joy of the brokers. On the Comstock all work is progressing favorably in the leading mines. In the Sierra Nevada they have started their first crosscut east on the 3100 level. This is known as east crosscut No. 1, and is at the north end of the main drift, just opposite west crosscut No. 4. There is nothing new in the deep winze that is being sunk by several north end companies, except that at the bottom there is a gradual increase of porphyry. This porphyry will gradually displace the bastard quartz which now forms the mass of material into which the winze is being sunk, and which blasts badly. In the Gould and Curry and Best and Belcher they are meeting with encouraging changes of material in some of the drifts. A force of men have been put to work on the 2800 level of the Hale and Norcross. The Chollar folks are making good headway, in a favorable formation, with their south drift on the 2600 level. The Yellow Jacket, Crown Point, Kentuck, Belcher and other Gold Hill mines are extracting and milling about the usual quantity and quality of ore.

Prompt Payment Needed.

It would be of great assistance to the publishers of this journal to have all its patrons renew their subscriptions promptly, save the expense of collections, avoid the changing and shifting of the position of the names on the printed mail list, and prevent some of the chances of errors occurring in addressing and mailing our very large list of subscribers. We, therefore, kindly urge upon all those who possibly can to renew their subscriptions early.

It is important to us that all not now paid in advance remit and place their credit ahead for a year. Verily every enterprising publisher heartily appreciates his list of promptly paying patrons. We hope our friends will not delay forwarding their postal orders because a single subscription is small in amount. We need the support of every intelligent person interested in the objects to which our paper is devoted. It is the interest of all such that the paper should be well sustained.

We have endeavored in every way to make this journal so valuable to its readers as to render it almost indispensable. No man can read it who will not likely find at least one or more single copies during the year, containing something worth many times the subscription price.

Don't Fail to Write.

Should this paper be received by any subscriber who does not want it, *or beyond the time he intends to pay for it*, let him not fail to write us *direct* to stop it. A postal card (costing one cent only) will suffice. We will not knowingly send the paper to anyone who does not wish it, but if it is continued, through the failure of the subscriber to notify us to discontinue it, or some irresponsible party requested to stop it, we shall positively demand payment for the time it is sent.

MINING SHAREHOLDERS' DIRECTORY.

COMPILED EVERY THURSDAY FROM ADVERTISEMENTS IN MINING AND SCIENTIFIC PRESS AND OTHER S. F. JOURNAL.

Bullion Shipments.

Paradise Valley, July 23. $4,578; from Nevada City mines for month of June, $92,000, by Wells Fargo & Co., and $20,000 by private hands; Stormont, 22, $3,340; Nevada ore, 22, $1,850; Horn Silver, 22, $12,000; Ontario, 22, $12,125; Hananer, 23, $2,600; Horn Silver, 23, $9,000; Hanaucr, 24, $2,450; Crescent, 24, $3,350; Horn Silver, 24, $9,000; Ontario, 24, $10,284; bullion from Salt Lake City, for week ending July 23, $123,358; Horn Silver, 26, $9,000; Ontario, 26, $1,054; Hanauer, 26, $8,450; Crescent, 27, $3,600; Ontario, 27, $5,725; Horn Silver, 27, $12,000.

COMPLIMENTARY SAMPLES OF THIS PAPER are occasionally sent to parties connected with the interests specially represented in its columns. Persons so receiving copies are requested to examine its contents, terms of subscription, and give it their own patronage, and, as far as practicable, aid in circulating the journal, and making its value more widely known to others, and extending its influence in the cause it faithfully serves. Subscription rate, $3 a year. Extra copies mailed for 10 cents, if ordered soon enough. Personal attention will be called to this (as well as other notices, at times), by turning a leaf.

Cheap Ore Pulverizer.

There is for sale in this city, by I. A. Heald, American Machine and Model Works, 111 and 113 First street, a Rutherford Pulverizer, an improved revolving barrel crusher, which was only used a few times and is as good as new. It will be sold very much below costs, and miners who are in need of such an appliance for a small mine will do well to make inquiries concerning it. It is suitable for a pulverizing mill for powder or other substances. References as to above can be had upon applying to this office.

IMPORTANT additions are being continually made in Woodward's Gardens. The grotto walled with aquaria is constantly receiving accessions of new fish and other marine life. The number of sea lions is increased, and there is a better chance to study their actions. The pavilion has new varieties of performances. The floral department is replete and the wild animals in good vigor. A day at Woodward's Gardens is a day well spent.

Educational.

W. E. CHAMBERLAIN, JR T. A. ROBINSON.

PACIFIC Business College, 320 POST ST. SAN FRANCISCO.

Returned to new building, former location, 320 Post street, where students have all the advantages of elegant halls, new furniture, first-class facilities, and a full corps of experienced teachers. Send for Circulars. LIFE SCHOLARSHIP, $70.

657 Mission Street, San Francisco.

MINING ENGINEER
Seeks Employment.

Inspect or develop mining properties; competent assayer; practical engineer and draughtsman; speaks Spanish; experience, Arizona, Mexico and Europe. Best of references. Address X. Y. Z., Box 2361, San Francisco.

First-Class Stationary Engine For Sale.

Right or left hand; 10½x24 inch cylinder; fly wheel 3,500 pounds; nearly new and all in perfect order. Will be sold at a great sacrifice for want of use. Terms of payment easy; on installment plan, if desired. Original cost $1,200. Can be seen in position any day. Address H. M box 2361, S. F. P. O.

PATENTS AND INVENTIONS.

List of U. S. Patents for Pacific Coast Inventors.

[From the official list of U. S. Patents in DEWEY & Co.'s SCIENTIFIC PRESS PATENT AGENCY, 252 Market St., S. F.]

FOR WEEK ENDING JULY 22, 1884.

302,317.—SAW-TOOTH—John J. Bowen, S. F.

302,488.—IRRIGATING AND DRAINING LAND—Luther M. Holt, Riverside, Cal., and C. N. Earl, Los Angeles, Cal.

302,338.—CONSTRUCTION OF BUILDINGS—Peter H. Jackson, S. F., Cal.

302,339.—STAIRS FOR BUILDINGS—Peter H. Jackson, S. F., Cal.

302,341.—SIDE-HILL PLOW—Ira B. Kilgore, San Jose, Cal.

302,343.—PIPE-JOINT AND COUPLING—John C. Kilton, S. F., Cal.

302,347.—SULKY CULTIVATOR—Neil McLean, Watsonville, Cal.

302,348.—DEVICE FOR OPERATING DOORS AND GATES OF ELEVATOR HATCHWAYS—Thos. H. Melrose, S. F., Cal.

302,615.—PEA SHELLING MACHINE—Felice Molini, S. F., Cal.

302,350.—ORE CONCENTRATING APPARATUS—Frederick Morris, S. F., Cal.

302,354.—SHEEP SHEARS—Samuel D. and D. E. Paxton, and A. Mahurin, Ukiah, Cal.

302,355.—BALING PRESS—Jacob Price, San Leandro, Cal.

302,357.—GRAIN SEPARATOR—Lovell A. Richards, Grayson, Cal.

302,359.—WAGON BRAKE—Thomas J. Sparks, Oroville, Cal.

NOTE.—Copies of U. S. and Foreign Patents furnished by DEWEY & Co., in the shortest time possible (by telegraph or otherwise,) at the lowest rates. All patent business for Pacific coast inventors transacted with perfect security and the shortest possible time.

Notices of Recent Patents.

Among the patents recently obtained through Dewey & Co.'s SCIENTIFIC PRESS U. S. and Foreign Patent Agency, the following are worthy of special mention:

GANG PLOW.—Robert Hendricks, Woodside, San Mateo Co., Cal. No. 301,985. Dated July 15, 1884. These improvements consist in the arrangement of the plows in front of the wheels and seat, in the means for throwing them to one side on sidling ground; in a means for changing the inclination of the plows, and in certain other details of construction.

GRAIN SEPARATOR.—Lovell A. Richards, Grayson, Stanislaus Co. No. 302,357. Dated July 22, 1884. It consists in certain improvements in connection with the straw-carriers whereby much of the grain which is usually carried off with the straw, and is discharged over the end of the machine, is separated and saved, being returned to the shoe.

SULKY CULTIVATORS.—Neil McLean, Watsonville, Santa Cruz Co. No. 302,347. Dated July 22, 1884. This sulky or orchard-cultivator consists mainly in certain details of construction embracing the connection of the frame with the wheel axle, the attachment of the teeth or shovel-shanks to the frame, an extension arm with a hinged tooth, a peculiar construction of the teeth or shovels, and certain details of construction.

HYDRAULIC ELEVATOR.—Albert F. Knorp, San Francisco, No. 302,003, dated July 15, 1884. This invention relates to certain improvements in that class of elevators in which the cage or platform is supported on the top of a vertically-moving column or piston rod, which is forced up to elevate the cage by a column of water; and it consists of a means for holding the sections together which form the column, and preventing their separation in case the joints become broken or detached. Binding rods extending top to bottom in the interior are so fixed that even if the column should separate it would not fall or produce a serious accident.

NINETEENTH
Industrial Exhibition
..... AND .....
MECHANICS' FAIR
SAN FRANCISCO. 1884
Opens August 5th; closes September 6th.

MECHANICAL PROGRESS, INVENTION, ART AND NATURAL PRODUCTS will be represented by the best obtainable exhibits on this coast. An

INSTRUMENTAL CONCERT

By an efficient Orchestra each afternoon and evening

PREMIUMS.

Medals of Gold, Silver and Bronze, Diplomas and Cash will be awarded as premiums to meritorious exhibits.

ADMISSION.

A. T. DEWEY, W. B. EWER, GEO. H. STRONG. } Dewey & Co.'s Scientific Press Patent Agency { ESTABLISHED 1860.

INVENTORS on the Pacific Coast will find it greatly to their advantage to consult this old, experienced, first-class Agency. We have able and trustworthy Associates and Agents in Washington and the capital cities of the principal nations of the world. In connection with our editorial, scientific and Patent Law Library, and record of original cases in our office, we have other advantages far beyond those which can be offered home inventors by other agencies. The information accumulated through long and careful practice before the Office, and the frequent examination of Patents already granted, for the purpose of determining the patentability of inventions brought before us, enables us often to give advice which will save inventors the expense of applying for Patents upon inventions which are not new. Circulars of advice sent free on receipt of postage. Address DEWEY & CO., Patent Agents, 252 Market St., S. F.

Iron and Machine Works.

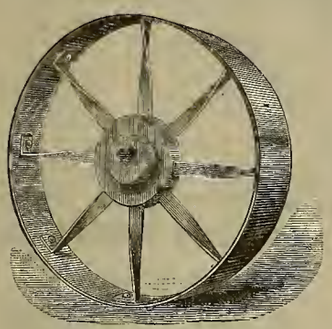
Brodie Rock Crushers, Steam Power, Hydraulic, Side Walk and Hand-Power ELEVATORS.

Manufacturers of B. E. Henrickson's Patent Automatic Safety Catches for Elevators. All kinds of machinery made and repaired. ☞ ORDERS SOLICITED.

MACBETH'S

—PATENT—

STEEL PULLEY.



Advantages of these Pulleys.

They are less than half the weight of cast-iron pulleys; are polished on the face; are made either crowned or straight, and are turned in the lathe the same as the best make of cast-iron pulleys.

They are carefully balanced. They are subject to no contraction strains, and can be run at very high speed without danger of bursting.

On account of their great lightness and the form of the arms, they absorb less power than any other pulley.

They are *the only pulley of the kind* which runs true. They cannot be broken in transport.

TESTIMONIAL:

MATHER LANE SPINNING CO. (Limited), LEIGH, ENGLAND, Nov. 5, 1883.

N. Macbeth, Esq.—Dear Sir: The Patent Steel Pulleys supplied throughout to our No. 2 Mill are working to our entire satisfaction.

They are very true, and are about 50 per cent lighter than the cast-iron pulleys in our No. 1 mill.

Yours faithfully,
For the Mather Lane Spinning Co. (Limited),
[Signed:] RICHARD T. MARSH, Managing Director.

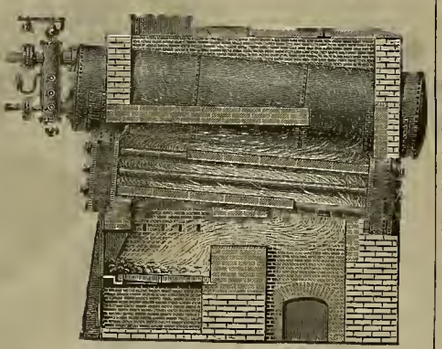
HEINE PATENT SAFETY BOILER,

RISDON IRON AND LOCOMOTIVE WORKS.

Sole Agents for the Pacific Coast, - Corner Beale and Howard Sts., San Francisco.



Economy in space and fuel. Safety at high pressures. Freedom from scaling. Equally adapted for power and heating purposes. Especially adapted for mills, factories, hotels, stores or any place where safety is a necessity. Will work well with muddy water and any kind of fuel.

TESTIMONIALS.

ST. LOUIS, Mo., Sept 28, 1883

Messrs. Adolphus Meier & Co GENTLEMEN: We cheerfully certify that the "*Heine Patent Safety Boiler*" put up by you in our establishment has proved very satisfactory in its working. The chief points of excellence in the "Heine Safety Boiler" are its economy in fuel and space, freedom from scaling, aptitude for power and heating purposes, working equally well with clear and muddy water. We warmly recommend it to all using steam machinery. Yours truly,

ANHEUSER-BUSCH BREWING ASS'N

OFFICE OF SUP'T OF ROYAL RAILWAYS, BERLIN, Sept. 23, 1883.

To Mr. H Heine, Civil Engineer: In reply to your inquiry of September 2d, we respectfully inform you that the three boilers built under your patents, under steam since September 25, 1881, at the Alexander Place Depot, as well as the two at Friedrich Strasse Depot, under steam since September 22, 1882, have given good satisfaction, requiring no repairs whatsoever to date. The internal cleaning of the boiler was always accomplished with ease on account of the convenient arrangement of the tube caps, the adhesion of scales being fully prevented thereby, and the boilers kept in prime condition.

(Signed): BRAUCKE.

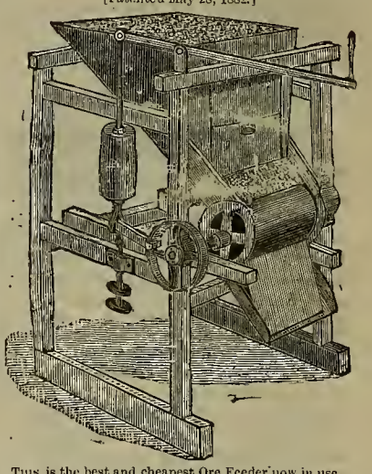
Water Jacket Smelting Furnaces for silver, lead and copper ores, with new and important improvements, superior to any other make. Hoisting Works, Pumping Machinery, Chloridizing Furnaces, etc. We offer our customers the best results of thirty years' experience in this special line of work, and are prepared to furnish the most approved character of Mining and Reduction Machinery, superior in design and construction to that of any other make, at the lowest possible prices. We also contract to deliver, in complete running order, Mills, Furnaces, Hoisting Works, etc., in any of the Mining States and Territories. Estimates given on application. Send for Illustrated Circular.

THE ROLLER ORE FEEDER

[Patented May 28, 1882.]



This is the best and cheapest Ore Feeder now in use.

It has fewer parts, requires less power, is simpler in adjustment than any other. Feeds coarse ore or soft clay alike uniformly, under one or all the stamps in a battery, as required.

In the Bunker Hill Mill it has run continuously for two years, never having been out of order or costing a dollar for repairs.

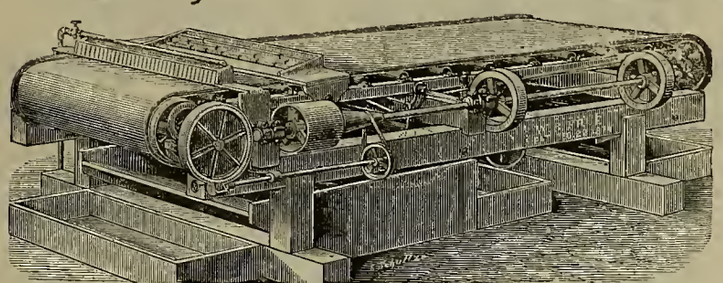
$1,000 CHALLENGE!



THE FRUE ORE CONCENTRATOR,
OR VANNING MACHINE.

PRICE REDUCED,

Jan. 1, 1884, to FIVE HUNDRED and SEVENTY-FIVE DOLLARS ($575.00).

OVER 800 ARE NOW IN USE. Saves from 40 to 100 per cent. more than any other Concentrator; concentrations are clean from the first working. The wear and tear are merely nominal.

A machine can be seen in working order and ready to make tests at the office of Huckley, Spiers & Hayes, No. 220 Fremont Street, San Francisco.

To those Intending to Manufacture or Purchase the So-called "Triumph" Concentrator, we Herewith State:

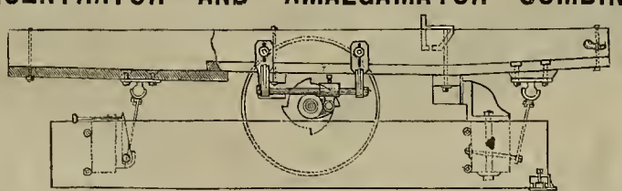
That legal advice has been given that *all shaking motion* applied to an *endless traveling* belt used for concentration of ores is an infringement on patents held and owned by the Frue Vanning Machine Company.

That suit has been commenced in New York against an end-shake machine similar to the Triumph, and that as soon as decision is reached in the courts there, proceedings will be taken against all Western infringements.

That we are and have been ready, at any time, to make a competitive trial against the Triumph, or any other machine, for stakes of $1,000.

ADAMS & CARTER, Agents Frue Vanning Machine Co.,
Room 7—No. 109 California Street, - - - SAN FRANCISCO, CAL.
January 3, 1884.

PATTEN'S
CONCENTRATOR AND AMALGAMATOR COMBINED.



This machine requires less power, less care or attention, and is less liable to get out of repair than any Concentrator now in use. All of which any practical miner will comprehend when seeing it in operation.

The wear and tear is nominal, and the construction so simple that any miner can put it up and run it, and the low price brings it within the reach of all millmen, as it will save enough to pay for itself in any mill in a very short time. One machine will concentrate the tailings from a five-stamp battery.

The undersigned is now located at the Etna Iron Works, 217 to 221 Fremont street, where he is building the above machines and prepared to fill orders, and guarantee them to do all that is claimed. Weight 625 pounds; price, $300. **Estimates given and orders promptly filled for all kinds of Mining Machinery.**

VOLUME XLIX Number 6.

Dry Crushing Silver Mill.

The accompanying cuts represent a dry crushing silver mill of forty stamps and eighty tons crushing capacity per twenty-four hours, as built by the Risdon Iron and Locomotive works of this city. This mill is intended for all base silver ores, where desulphurizing and chloridizing is necessary for amalgamation. It contains all of the latest improvements in cylindrical roasting furnaces and rotary dryers: also the Boss continuous process in pans and settlers and quicksilver apparatus. The engines and boilers are of the latest type and especially constructed for a mill of this kind.

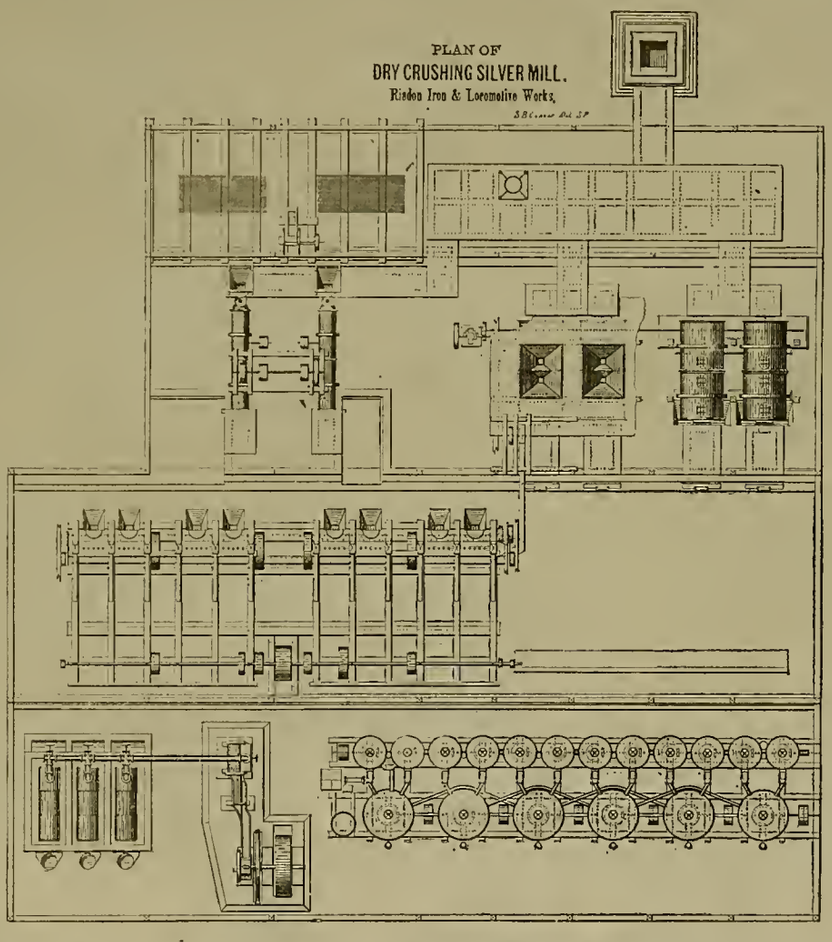
As will be seen from the cuts (the plan on this page, and cross-section on page 85), the ore is brought in at the upper part of the mill, where it is dumped on to the "grizzlies" or screens, made of bars of iron, ¾¾ inches, and set on edges 1½ inches apart, and inclined so as to allow the coarser rock to run to the lower end on to a platform, while the finer goes through into the ore bin. The coarse rock is then run through the rock-breaker (which stands in position where the coarse rock lands, after having passed over the grizzly), and into the bin with the fine rock, from which it is drawn into the self-feeders, and passed through the continuous discharge rotary dryers, which are arranged to discharge into cars, from which the dried ore is dumped into the battery feeders and is crushed. It is then carried by screw conveyors to a bucket elevator, and there raised to a bin above the roasting furnaces, from which it is drawn into cars and weighed, and then put into the hoppers over the furnaces, where the proper chemicals can be added, and the charge prepared for desulphurizing and roasting.

The furnaces are started and stopped by an improved arrangement of friction clutch, made only by the Risdon Iron Works. The furnaces are also made with all of the latest improvements in running gears, charging doors, sampling doors, dampers, etc., sheetiron fireboxes, and cast steel track-rings and rollers, making them both economical and durable, while at the same time they are well adapted to all kinds of roasting ores.

The furnace charging-doors being opened, and the furnace revolved to its proper position so that the doors come directly under the chute-doors of the hopper, it is stopped and the charge run in, when the doors are closed and the furnace started and kept running until the ore is thoroughly desulphurized and chloridized, when the discharging doors are opened and the furnace revolved until the ore is out, when another charge is put in as before. The whole time required for discharging and charging is from five to ten minutes. As seen by the cut, the furnaces are discharged at the end door into a chute which runs under the fire-box, where the ore can lay and be drawn off at leisure and spread out on the cooling floor directly in front and below. From there it can be conveyed by a screw conveyer to the first pan, water being introduced just before it enters it. There are pipe connections between all the pans and between all the settlers, and the pulp passes through all the pans from the first to the last before it goes to the settlers, receiving a continuous treatment and meeting with fresh quicksilver in every pan.

If necessary a different treatment may be pursued in different pans, according to the judgment of the mill superintendent. After the ore has passed all the pans it passes through all the settlers, from first to last.

It has been demonstrated that this process of working ores is very effectual, and makes a great saving in expense. It does away with a large amount of dust and dispenses with the labor of charging pans. There is less liability of loss of quicksilver, in consequence of the pulp passing through so many pans and settlers in succession. The process of amalgamation can be watched at every pan, and any defective amalgamation can be remedied before the pulp passes out of the last pan to the settlers.



MESSRS. GODBE & HAMPTON are preparing to leach the Raymond & Ely tailings at Bullionville. There are 80,000 tons of them. They had been run through the mill once and the lead taken out of them and smelted. It is proposed now to leach out the gold and silver, and it is expected to be done so as to leave a good margin for profit.

Precipitate.

There is a steady increase of the quantity of copper precipitate shipped from the mines which produce pyrites in Spain and Portugal. At these mines, among which are the Rio Tinto, Tharsis and San Domingo, a small proportion of high-grade ore is smelted into regulus direct; the medium grade, running about 3.5 to 4 per cent of copper (wet assay) is shipped as such, while all the low-grade ore is treated on the spot by roasting enormous quantities in heaps, leaching, and precipitating the copper with scrap iron. The resulting copper, called precipitate, is an impure metal, running from 50 to 70 per cent. Efforts have been made in the past few years to replace this crude process, with the drawback of the injurious effect of the sulphurous acid fumes upon vegetation and its enormous consumption of scrap iron, by the Doetsch and Derby method, which extracts the copper from the crude ore direct. This promises to solve the question which threatens the life of the pyrite mines. It dispels the hopes of the Spanish and Portuguese miners that by a gradual decline of their market with sulphuric acid makers, they would be checked in their steady advance as copper producers. It is difficult to arrive at the amount of precipitate imported into England because returns do not show the relative amount of precipitate and regulus.

Copper Pyrites.

The demand in England for copper pyrites has been lately subject to considerable fluctuations. The business is one which has, during the past year, been agitating copper producers in the country considerably. For some years, Canadian pyrites have been coming in, and more recently pyrites from New Foundland and Spain, and it has been feared the copper extracted from them would seriously affect our markets. Such pyrites are beginning to be used by our sulphuric acid makers, as a substitute for imported brimstone, which is consumed by them, at the rate of 100,000 tons a year. To supplant the latter entirely, 200,000 tons of pyrites a year would be needed. The average contents of the pyrites imported into England is a portion higher than 2.5 per cent, and the extreme limits of the copper contents, admissable for good working in pyrites kilns, is placed at five per cent. Assuming that the average of pyrites imported into the country would be 3.5 per cent, a general change of its present method of producing sulphuric acid from brimstone to the burning of pyrites, would carry into the country 7,000 tons of copper, assuming that there were no less in treatment. It is not likely that any other but the acid works on the coast would avail themselves of the cupriferous material, so that only a portion of the total demand could be covered this way.

In the last government report on mineral statistics, it is stated that there are now in this country, six works actually using pyrites, and with their present plant, and the ores they are working, they do not properly produce, at a rate greater than two or three million pounds of copper. One of them has adopted the European plan of leaching, and in fact is regarded as a plant to afford one of the Spanish mines an outlet for a portion of its product. The others follow the successful practice of smelting the cinders (after burning off the sulphur in kilns), in water-jacket furnaces, at a cost sometimes, as low as $1.75 per ton. The handling of large bodies of cinders is thus avoided, a small quantity only of concentrated matte being shipped to the copper works when the metal is extracted.

CARLISLE, NEW MEXICO.—A correspondent, "B. F. R.," sends us this item: The Carlisle mine is working a larger force of men now than ever before, being about a hundred miners and probably sixty to eighty outside. There is in course of construction a large smelter, which will be completed this season. Everything is running on full time. There has been quite a rush to this camp for some time, and the consequence is there are many who come and go without obtaining employment; consequently there are many reports afloat that would not be, if miners would use a little discretion. This camp, which is in Grant county, is one of the best in the Territory.

SACRAMENTO citizens are taking steps to clean the city and make it epidemic proof.

CORRESPONDENCE.

We admit, unendorsed, opinions of correspondents.—EDS.

Placer County Notes.

EDITORS PRESS:—Howard Hill, half a mile east of Ophir, is down 50 feet on free milling quartz rock having a width of from 12 to 18 inches which works from $20 to $30 per ton. The ore is galena and sulphuret of iron. The hoisting is done by an overshot water-wheel 24 feet in diameter with pump and friction gear for hoisting on one side, with arrangements on the other side for a two-stamp mill now in course of erection to be attached. Mr. Hill has about 20 tons of fine looking ore on the dump.

There is a general revival of prospecting going on around Ophir.

Chas. Reed is prospecting on West Hill.

Mr. Milton north of town.

Jim Wirm still pushing ahead in his tunnel on Brush feuce ledge.

Hooper & Norton at head of Baltimore ravine, are now erecting a 16-foot overshot water-wheel and putting in four inch pump. Intend, as soon as water is pumped out of the shaft to erect a five-stamp mill on claim. Ledge one and a half to two feet wide. Rock works over $20 per ton.

Frank Laveling has just let a contract for 80 feet of tunnel for prospecting in the direction of Newcastle. M.

A Small Locomotive.

EDITORS PRESS:—Mr. A. M. Davison, Agent of the C. P. R. R., at Cold Run, Placer Co., has constructed a small locomotive about thirty six inches long including tender, corresponding in all respects with an ordinary eight wheeler engine. Driving wheels are about six inches in diameter; connecting rods of brass; cylinders are brass; diameter of pistons one and three-eighths inches, with a stroke of two and one-half inches; boiler of copper, with flues and fire-box same as in large engine; wood burner; built of metal—copper, brass and iron; cab of wood; all the proportions of a large engine are preserved. A small passenger coach about three feet in length is attached. A good deal of power is developed by using a small flat car on which one of his children can sit, and the engine draws them around in fine style. Under a good head of steam the engine will represent a rate of speed of forty miles an hour, of a large engine. Mr. D. was about two years in constructing it, putting in spare time. It attracts a good deal of attention from those of the traveling public, who have the opportunity of seeing it in operation. The engine and cars run a circular track of about 200 feet in length, having a gauge of six inches. M.

THE SILVER KING.—This mine is probably more extensively known than any other on the continent, outside of the Comstock, partly owing to the romantic events attending its discovery, and partly to the wonderfully rich specimens of native silver which it has yielded. Judged by the dividends it has paid, it does not rank very high and even these have ceased for the past year. There is considerable mystery surrounding the present condition of the mine, but it seems to be generally conceded that the bottom has been reached, although there is a quantity of good ore yet to be mined in the upper levels. Sinking has been suspended at the 800 level. The Mowry Company, which has sunk over 1,000 feet just outside of the King line and drifted under the King has also ceased operations. We hear that an attempt is being made to dispose of the mine to an English company. If it is so it may be safely inferred that the begining of the end has been reached, as so valuable a cow as this has proved is not often sold until she begins to run dry. The mine has always been more or less of a close incorporation, having been worked in a manner that must be very satisfactory to Col. Barney, the chief owner, if not to the rest of the stockholders. —*Quijotoa Prospector.*

THE BELMONT MINE is coming to the front as one of the best mining properties in Eastern Nevada. Never in the history of this mine was there so much rich ore exposed as at present, and, in consequence, the force of miners has been increased. Under the able management of Superintendent N. C. Fassett, the work of development in the southern portion of this property, which is all virgin ground, is pushed with great vigor. All the stopes are showing rich ore, and this mine was never in a more prosperous condition than at present. The face of the drift is still in good ore, and the prospects at this point are most encouraging, and it is firmly believed that the ore body is continuous. The ledge carries chloride and black metal ore; measures all the way from three feet to four feet, five inches. The capacity of the leaching works has been doubled, and the capacity of the cooling floor has been quadrupled; and it will not be long before the old Belmont will turn out and ship bullion in good quantities. The plucky owners of the Belmont mine have now the greatest assurance that their labor will be rewarded in time.—*Belmont Courier.*

Vermilion Manufacture.

The following article is taken from Mr. Christy's translations of a brochure on the Imperial Quicksilver Works at Idria, Krain:

In the oldest times of the existence of the present works, vermilion was manufactured. In the beginning it was merely pure, pulverized, cinnabar ore, then later it was a product made by sublimation from this substance; and there were formerly other works for vermilion manufacture than those for quicksilver production. When the Venetians and Dutch began to produce better wares, the production here sank steadily.

The researches of Christofoletti, 1681, and of Baron Richtenfels, in 1726, for the improvement of Idrian vermilion, met with as little success as those of some Venetian women—1740–1741—who had lost their husbands in the Venetian works and had offered themselves to manufacture vermilion according to the Venetian method.

After Haequet had strongly urged the manufacture of vermilion, Oberhuttenmeister Ignaz v. Passetzky succeeded, with the Dutchman Gussig assisting him, in making beautiful cake cinnabar in 1782, and in 1785 vermilion also, in the newly built works on the right bank of the Idriza.

In 1796 Oberbuttenverwalter (manager of the works) Leopold v. Passetzky introduced the sublimate and precipitate manufacture, but it was abandoned as unprofitable in 1824.

The many foreign attempts to manufacture vermilion in the wet way caused similar ones here, as those of Fabriks-Controlor Rabitsch in 1838, and latter of Huttenverwalter M. Glowacki, which brought larger amounts of the vermilion so manufactured into the market. Still this manufacture came to no full development, and became forgotten until, finally, in the years 1877 and 1878, experiments led to its being discontinued on account of its costliness and uncertainty of the method. A new set of experiments in 1878 and 1879, by Assayer E. Teuber and Director of Works (Huttenverwalter) H. Langer, under the direction of the Imp. Agricultural Ministry, led to favorable results. A new manufactory, set in operation in 1880, furnishes three sorts of vermilion manufactured in the wet way.

The arrangements of the works for the manufacture of vermilion in the dry way consists of: One sulphur stamp battery. One amalgamating plant with eighteen small barrels, both pieces of apparatus being driven by a two-horse-power water wheel. Four sublimation furnaces each with six retorts of cast-iron. Four vermilion mills, each driven by a water wheel of 2.5 horse power. Kettles and vats for heating, digesting and refining the ground cinnabar. One drying hearth. The preparation of vermilion, as an article of commerce, falls into several separate operations, viz:

1. Almalgamation; *i. e.*, preparation of the raw Mohr.
2. Sublimation; *i. e.*, preparation of the cake cinnabar.
3. Griuding of the cake cinnahar, refining and drying of the vermilion.

For the preparation of the raw Mohr for each charge of eighteen kegs there are taken 80.64 kg., powdered and sifted sulphur, and 423.36 kg., of quicksilver.

The amalgamating kegs each contain twenty-eight kg. of the charge, and are given intermittent rotating motion by a rack and pinion driven by a water wheel. After, on an average of two and three-quarter hours, the amalgamation is complete and the raw Mohr is taken from the casks.

For the sublimation four furnaces are used, each with six pear-shaped cast iron retorts of considerable thickness. Each is charged with fifty-eight kg. of Mohr, the mouth covered with a loosely-placed sheet-iron helmet, the furnace being slowly fired; the combination of the sulphur and the quicksilver then results in about fifteen minutes, with a detonation. As soon as this operation (das Abdampfen) is over, a clay helmet is placed over the retort and the firing is increased so that after two hours and twenty minutes, the exeess of sulphur evaporates from the tube. The condenser is now added (Stuckperiode Cake-period) and luted then the firing is still more urged, whereupon the cinnabar volatilizes and deposits itself upon the glazed earthernware condensation apparatus (tube, helmet, etc.). After four hours the sublimation is complete, and there is furnished by the helmet 69 per cent., by the tubes 26 per cent., by the coudenser (Vorlage) 2 per cent. cinnabar.

The grinding of the cake cinnahar takes place in four mills driven by an undershot water wheel. These mills have a fixed under and movable upper stone, and the grinding is done with water. The vermilion which leaves the spout and runs into glazed clay vessels has a temperature of about 38° C., that of the air being 15° C. The millstones make forty revolutions per minute, and after each passage of the charge are placed nearer together. There are three sorts of vermilion manufactured:

H. R: high-red vermilion
D. R: dark-red vermilion.
C: Chinese vermilion.

From the mill the cinnabar undergoes the refining, which consists in digesting the cinnabar in potash lye.

As soon as the cinnabar charge has settled in the refining vat, the solution is drawn off and the cinnabar is washed with water until the water runs off perfectly clear. The pulpy mass is placed in glazed drying vessels and dried.

The dry vermilion is then sifted and packed. The greater part by far of the vermilion, as well as cake cinnahar, is packed in tanned sheepskin in packages of 12.5 kg., of which a pair are placed in a wooden keg. Only a small part of the vermilion comes in boxes of 0.5 kg., which again are packed in larger boxes of twenty-five and fifty kg.

California Iron.

From an interview with Irving M. Scott, of the Union Iron Works, in the *Chronicle*, we make the following extracts, which impart some information concerning the iron interests of the State: "The furnace plant at Hotaling, Placer county, has a capacity of about 30 tons a day. The fuel used is charcoal, of which there is consumed about 100 bushels to the ton. With other expenses of manufacture, it costs there about $18 per ton. The tariff is $6 75 per ton. The selling price of pig-iron is about $25. The freight to San Francisco is $2 75 per ton, which, added to $18, the cost, makes $20 75. There are 177 men employed, and they distribute in the county of Placer about $12,000 dollars a month.

"There are great numbers of iron deposits in the State. There is splendid iron ore found in Sierra valley, in Shasta, near Napa, in the neighborhood of Sonoma, not far from Los Angeles, in San Bernardino county, and elsewhere in the State. There are also great deposits in Oregon and Washinton. There is plenty of ore everywhere, but, unfortunately, a lack of fuel. The iron interests of California have much to prevent their rapid development, and need all possible encouragement.

"There is the Oswego furnace at Portland, Or., which has been closed for some time. It has been in existence several years. When iron is $30 a ton it makes a profit, but when it is $25 it comes out about even. Pig-iron is made there with charcoal. The reduction or abolition of the tariff on pig-iron would have the effect of permanently ruining that enterprise.

"There are 225 men employed there. These two are not, however, all the furnaces on the coast where pig-iron is made. There is an iron company at Irondale, on Puget sound, owned and operated entirely by San Francisco capital. Their works are located in a large bank of ore known as bog ore, in the midst of dense forests. A portion of it they bring from Texadra Island. They have not yet manufactured enough with their improved facilities to know the exact cost per ton of the pig-iron they produce.

"At present not one pound of boiler iron-plate suitable for shop work is made on this coast; but the California Iron and Steel Company are putting up a 'blowery' for the purpose of manufacturing plates, or making the 'blooms' out of which plates are rolled. Any reduction of the tariff that would affect the manufacture of iron would seriously affect the manufacture of plates. Of course all this represents a beginning, but it means the birth of many new industries and the opening of many new avenues of labor. We want to keep the money that is being constantly sent East or abroad in our pockets and circulating among ourselves. We want to see our workingmen kept busy. When it is no longer necessary to send east of the Sierra for any of the articles that we need for our daily use, then the transportation question will have been settled forever. Then it will not be so much a matter of what we receive by rail as of what we send away. Then the railroads will be obliged to carry *from* San Francisco a thousand miles in any direction as cheaply as they now carry the same distance from Chicago or New York."

MINERAL HILL.—A correspondent of the Eureka *Sentinel* writes as follows from Mineral Hill, Nev.: During the early Spring it was confidently expected that leaching works would be erected here this summer, but for some unexplained reason, this much-to-be-desired improvement will not be consummated this season. The mill has been operating on tailings for six weeks or more, and is said to be producing more satisfactory results than during any previous run. Seven bars of bullion is the product for the present month. The works are now closed for a general clean-up, but will resume operations in a few days. It is proposed to keep running until winter, and, perhaps, then, if the weather is not too severe. Only a few men are employed in the mines of the company, but those few are all working in ore of a high grade. The battery will probably be dropped later on, when this ore will be run through, and add materially to the bank account of the owners. But few other mines are working on the hill at present. The Hartford and a few other small mines are still producing some good ore, while the Swallow, which held out such promises a month since, seems to be under a cloud. The managers of the furnace near Palisade became interested, in some way, in the latter-named property, and for a month or more have had men working and sorting the old dumps. Considerable of this ore was recently shipped to the furnace, since which time but little has been heard from the management, and the wherewithal to reimburse the employers has not been forthcoming. As a result of this apathy, on the part of the managers, the mine is now idle. Frequent letters of inquiry to find out why this is thus failed to elicit any response from their employers, and sundry expletives are heard in highways and by-ways which are more forcible than elegant, and seem to portend a coming storm.

Crystallized Gold in Prismatic Forms.

Near Clancy, on Clancy Creek, Jefferson County, Montana, minute crystals of gold occur which present the novelty of a solid octahedral nucleus, or head, with a long divergent brush-like or prismatic development of the gold on one side, or angle, giving the whole the appearance of the drawings usually made to represent comets. The total length of these crystals does not exeeed from two or three millimeters (about one-eight of an inch), and the minuteness of the cross-section of the delicate divergent prisms makes it extremely difficult to determine their form. They are, also, very brittle, and they cleave or break asunder in planes at right angles to their length. Under the microscope these prisms are seen to have three or more plans and they appear to be hexagonal. They taper gradually and uniformly to a sharp point, and are sometimes composite, being for part of their length formed of two or more prisms joined side to side.

Among the fragments, one larger and broader than the others exhibits a solid octahedral nucleus with a flat or plate-like projection on opposite sides. This projection shows distinctly on one side a line of composition through the center, with divergent lines or markings at an angle of 45° with the medial line of composition, is slightly trouth-shaped, being formed of two plane surfaces inclined towards the medial line. The opposite side is rough, with angular projections.

These plate-like projections from the octahedron are much larger than the prisms, but it is probable that the origin and crystallization of both are similar. The plates have the appearance of being formed by the combination or twinning of octahedrons parallel with their faces with their main axes inclined towards each other at an angle of 60°.

Hexagonal Prisms of Gold.

At Sonora in Tuolumne County, California, I obtained some years ago from the late Dr. Snell a sample of very small but brilliant prisms of gold. Under the microscope these are seen to be hexagonal prisms with smooth and brilliant planes and terminated at one or both ends with a pyramid. They appear to be well formed crystals without marks of composition or twinning. The basal plane is also visible. The angle between the prism (*I*) and the pyramid (1) is approximately 130°, by measurement kindly made for me by Professor E. S. Dana. They resemble the prismatic gold crystals figured by Professor A. H. Chester, and obtained artificially by digesting gold amalgam in nitric acid. He obtained 136° for the angle $O \wedge 1$, which would give 134 for $I \wedge 1$. It is possible that the Sonora crystals are also artificial, but there is no means of verifying their origin. Similar crystals obtained at Angels Camp in the same region were said to have been taken from a cavity in quartz.

The crystals described by Professor Chester contained 9 per cent of mercury. Le Sage, a writer of the last century, 1777, also mentions prismatic crystals of gold obtained by heating the amalgam. He describes them as square prisms with terminal pyramids of four planes, and considered them to be lengthened octahedrons.—*Wm. P. Blake in Journal of Franklin Institute.*

CUMMER ENGINES.—The 250 H. P. Cummer engine just started in the Amoskeag Cotton Mills, Manchester, N. H., has attracted the admiration of all in that vicinity, and is looked upon with a great deal of pride by the owners and manufacturers. During the past week the Cummer Co., have made the following shipments: A 55 H. P. engine, with outfit complete, to the Goshen El. St. Co., Goshen, Ind.; one of 120 H. P. to Louie Mitchell, Wausan, Wis.; a 130 H. P. engine to C. B. and D. H. Gowan, Canal Winchester, O.; one of 55 H. P. with complete outfit, to A. Dietly and Son, Moorheadville, Pa.; and a 250 H. P. engine to I. P. Evans & Co., Indianapolis, Ind. The Cummer Engine Co., have just started one of their ice and refrigerating machines in the plant of the Robt. Portner Brewing Co., Alexandria, Va., and another in the brewery of Albert Ziegele & Co., Buffalo, N. Y. This is the second Ballantine ice and refrigerating machine furnished the Ziegele Co., and the makers consider it a strong endorsement of their machine. The Cummer Co. have just completed the erection of two of their refrigerating machines in the plant of the Co-operative Brewing Co., Buffalo, N. Y., and expect to ship another ice machine and four more engines this coming week. They report a very flattering outlook for their business, and that they are running to their capacity on ordered work.

THE promoters of the proposed American exhibition in London have been earnestly at work during the past few weeks, and the success of their exertions is shown in the composition of the "Council of Welcome," which has just been announced. The Board comprises some of the most influential peers and public men in England.

THE assessment roll of Shasta county for the present year stands as follows: Real estate and improvements, $2,123,685; personal property, $1,334,113. Total, $3,457,798, being an excess over last year of $1,079,676.

THE Piute pow-wow recently held at Wadsworth, Nev., broke up in a row over the election of a chief to succeed the recently deceased Winnemucca. A deadlock ensued and no chief was elected.

MECHANICAL PROGRESS.

A New Process of Steel Making.

A patent has recently been granted to Mr. W. A. Otto Wuth, of Pittsburgh, for a new process of producing steel from wrought iron with plumbago, the steel produced being, it is claimed, of a high grade and substantially free from sulphur and phosphorus, and containing a definite percentage of carbon. The process consists in making the steel from wrought iron that is practically free from phosphorus, sulphur and carbon, by melting it on an open hearth in contact with a form of carbon which will not oxidize at the heat necessary to smelt the iron, but which will unite with the iron at that heat. Any wrought iron which is sufficiently low in phosphorus may be used as the basis of this process, though muck bar made according to a previous patent of Mr. Wuth he preferred as being especially pure. The decarburized iron of the requisite purity is first cut into pieces of convenient length, and placed in the hearth of the furnace in layers piled one above the other. Between each layer of iron is spread a thin stratum of plumbago, preferably in a pulverized condition, although it may be used in lumps. For this purpose the inventor employs the plumbago of commerce, but of good quality, containing about 98 per cent of carbon and 2 per cent of silica, with a trace of iron. The hearth of the furnace is charged with alternate layers of wrought iron and plumbago, until it is sufficiently full, the relative thickness of the layers depending upon the amount of carbon which it is desired that the resulting steel should contain. If the iron were absolutely free from slag, and the plumbago were also absolutely pure carbon, then the proportions of the charge would be the same as the proportions of iron and carbon in the desired steel product; but as there is always more slag in muck bar (not, however, exceeding 1 per cent), and some silica in the plumbago, the proportions of which can be ascertained before the furnace is charged, the necessary allowance for these elements will have to be made, and the percentage of carbon can be regulated with great exactness, so as to produce steel, it is claimed, very nearly approaching to an ideal steel. The furnace being thus charged with muck bar and plumbago, the charge is melted in the usual way, and the operation further carried on as in the well known open-hearth process. Before the melted metal is withdrawn from the furnace, a small and definite amount of spiegeleisen or ferromanganese is added. By this process Mr. Wuth says he has made several charges of steel of 12 tons each, containing as low as one-hundredth of 1 per cent of phosphorus, and that he will be able to produce any kind of fine steel that may be desired.

Turning Chilled Iron.

The difficulty, says the *Mechanical World*, of turning rollers that have been chilled in casting, for the purpose of increasing their strength to resist the action of rolling, is owing to their extreme hardness, and in some cases the strongest tools will have but very little effect upon them, and even then they require a very slow speed with as slight a cut as possible. In turning, rolls not more than 14 inches in diameter—a speed that will not make more than one turn in four minutes, is often used. The cut is taken with a wide tool, without any feed motion, in the direction of the central line of motion. The cutting face of the tool lies in nearly the radial plane with the axis, and the amount of clearance is as small as possible, while a fine cut is taken by scraping, and weeks are required to finish what would be accomplished in as many days if the metal was not chilled in casting. The turning tool must be dressed from the very best of cast steel and left as hard as possible, held firmly in the tool-rest, and forced slowly to its work while the material is being removed slowly, but surely, till the proper size is reached, when it is set along on to take the next cut in this similar manner.

In working with hardened steel, such as cutting out circular cutters from saw-plates that have been hardened without disturbing their temper, clamp the saw-plate firmly to the face-plate of the lathe, and drive with as slow a speed as possible. If the back gears will not reduce the speed sufficiently, then manage to connect the lathe in some other manner for this purpose. The hardness of the tool must exceed the temper of the plate, or one will be as likely to be affected as the other. The particles at the extremities of the cutting edge must be as hard and more firmly supported than any of the material to be removed, and where there is but little difference between the resistance of the cut and the strength of the turning tool it is evident that the speed must be very low, as the resistance increases with the speed of the cutting and increases the strain brought upon the cutting edge of the tool. This amount is reduced to its minimum by reducing the depth of cut and the time in which it is to do the work, which reduces the operation of working metal of extreme hardness to that of scraping, as it were, while the work is barely perceptible in motion.

GRINDING BY MACHINERY.—For some time past a machine has been at work in Sheffield, which has effectually solved the problem, whether grinding can be done by machinery. It is the invention of James Mitchell. Not only can the machine do the work of five or six men, but the quality of grinding is said to be superior to that produced by hand labor. It is almost automatic in its action, and it does its work so easily and satisfactorily that a boy is sufficient to attend to it. The machine is altogether unlike what had been expected. There is no large revolving stone like those to be seen in grinding mills; but its place is taken by segments or blocks of stone, fixed by wedges and screws into the ribs of a hollow disk. These stone blocks are set with their faces toward the object or objects to be ground; and they are so fixed that they can readily be moved outward as the face begins to wear. When the machine is set in motion, the disk rapidly revolves at right angles to a bed or bedplate. To this bed plate the objects to be ground are secured. It has a backward and forward movement, and as it moves the articles secured to it are brought into contact with the stones on the face of the disk. The rapidity with which the machine does its work in comparison with the results of hand labor is very striking. But not only is it capable of grinding flat surfaces, and truing up edges; it grinds concave or convex, and bevels and angles equally well. It will thus be seen that the machine can be used upon a variety of objects.—*Scientific American.*

A New Manganese Steel.

A patent has been granted to J. F. Bennett, of Pittsburg, for an improvement in the manufacture of manganese pig iron, the object of which is to produce a pig iron having an excess of carbon by reason of the presence of manganese, and a minimum of silicon. The inventor claims that the result is a metal of such varying hardness as is desirable for stamp-heads, ore-crushers, &c. The precentage of the principal elements in the iron are: Manganese, 8.5 per cent; carbon, 4.45 per cent; silicon, .05 per cent. The first step in the progress of manufacture is to add manganiferous ores to the iron ores in the blast furnace to such an extent as to produce iron of the requisite percentage of manganese. The liquid measure is conveyed from the blast furnace into a reverberatory furnace, where it is kept until by the action of the hot gases passing on it silicon is removed; the metal is then run into pigs or else the entire charge of the reverberatory furnace is transported by means of a large ladle and trough to the casting mold. Concerning the amount of manganese ore necessary to add to the blast furnace charge, Mr. Bennett says that it would depend largely upon the quality of the iron ore and the mode of smelting, and would be governed by the following reactions.

If the iron ores contain as much as one per cent of phosphorus and are smelted with a comparatively cold blast of 800° F., part of the manganese would be taken up by the phosphorus and passed into the slag as phosphate of manganese; consequently it would require ore containing 11.5 per cent of metallic manganese to give 8.5 per cent in the finished product; again, if the same iron orea are smelted with a hot blast of 1,200° F., the same proportion of manganese would be taken up by the phosphorus, but a smaller proportion would go into the slag as silicate of manganese; therefore, ore containing 10.5 per cent of metallic manganese would give 8.5 per cent in the finished product; further, if the iron ores contain as little as one per cent of phorphorus and but little silicon, and are smelted with a blast of 1,200° F., it would require ore containing 9.5 per cent of metallic manganese to give 8.5 per cent thereof in the resulting pig iron; hence the most favorable conditions for reducing the percentage of metallic manganese required in the manganese ore to obtain a product containing a given per cent of the same are iron ore comparatively free from phosphorus and containing a minimum of silica, smelted at a low pressure of blast raised to the highest attainable temperature.

Mr. Bennett has been granted a second patent for a method of producing a manganese pig iron having a different composition from the above, the advantage claimed for it being that it has superior chilling qualities, and is therefore specially adapted for the manufacture of car-wheels. To attain this product the constituent elements should be present in the following proportion: Four per cent manganese, 4.15 carbon, .05 silicon, .375 phosphorus and other metals, and 91.425 iron.

HEAT OF COMBUSTION OF WOOD.—Mr. Ernest Gottlieb, says the *Revue Industrielle*, has made several analyses of different woods after drying them at a temperature of 115° C., and has compared the figures obtained with the amount of heat that would be developed in their combustion. The carbon and hydrogen were determined directly by combustion, by weighing the carbonic acid and vapor of water formed, the remainder, after deducting the ashes, giving the oxygen and nitrogen. The results were found to be in access of those deduced by applying the formula of Dulong. The wood containing 40.03 per cent of carbon and 6.06 per cent of hydrogen by combustion produced 4785 calories, which number, according to the formula, should have been only 4139.

A RULE for calculating the steam space of a boiler places it at twelve times the volume of steam required per stroke; another gives the volume of steam at something less than half the volume of water.

SCIENTIFIC PROGRESS.

Influence of the Earth's Rotation on the Flow of Rivers.

Mr. G. K. Gilbert contributes a new element to the discussion of "the sufficiency of terrestrial rotation for the deflection of streams," in a paper read to the National academy of science in April, and recently published in the *American Journal of Science*, which is presented by *Science*, as follows: Taking Ferrel's measure of the deflective force that comes from the earth's rotation, Mr. Gilbert shows, by a remarkably simple consideration, that its value is not so much in throwing the whole stream against its right bank, as in selecting the swiftor threads of the current, and carrying them against the bank; and, further, that this action will have especially well marked development in meandering streams, where it will aid the cutting on the meanders of right-hand convexity, and diminish it on those of left-hand convexity. For the Mississippi, the selective tendency thus determined toward the right bank is nearly nine per cent greater than toward the left; but it is not stated that the valley form has been noticeably affected by this preference. On Long Island, however, the form of the valleys is clearly controlled by the earth's turning, as was first suggested by Mr. Elias Lewis some years ago, and recently confirmed by Mr. J. C. Russell.

The article by Mr. Gilbert advances the question not only by properly applying the law to rivers flowing in any direction, but further by giving it a more delicate analysis than it has yet received, with the conclusion that in a certain favorable case the form of a valley may be decidedly influenced by this hidden control. While the result is of interest to physical geographers, the method of analysis has a wider importance. The application of mathematics to terrestrial physics has too often been fruitless from dealing with problems in a simplified or idealized form that departs too widely from the complications of natural conditions. This was notably the case with the supposed demonstration obtained by Hopkins in his geological speculations. It is therefore gratifying to find that increased value of Von Baer's law, now found by Gilbert, comes essentially from a close consideration of the actual rather than of the ideal conditions of river-flow. It is an advance in the application of mathematics as well as in the explanation of facts.

The lateral tendency of rivers was first noticed in the case of the Volga, which undercuts its right bank, as it should in this hemisphere. Other examples are found in North Carolina, in the channels of the streams flowing eastward to the coast, where the southern banks are the steeper; again on Long Island, and on the plains of New Zealand. But the radical valleys of south-western France afford better illustrations than any of these, inasmuch as their forms are accurately shown on the great map of the army engineers. North of the Pyrenees, about the towns of Tarbes and Auch, there is an old sandy delta deposit spread out by the rivers from the mountains while this region was still under water; and since its elevation, the streams formed upon it all follow its gentle slopes, diverging like the ribs of a fan from the higher center toward the lower margin, and cutting down their channels into the old delta plain. There is nothing here in the flat layers of unconsolidated sands to determine an unsymmetrical form in the valleys: and yet they all show most distinctly a gentle slope on the left, and a steeper slope on the right; longer lateral branches on the left, and shorter ones on the right; and many of the highways, constructed parallel to the streams on the as yet, unbroken uplands, are clearly closer to the streams on their left than on their right. All this is a direct effect of the earth's rotation.

It is customary, in speaking of the deflective force that arises from the earth's rotation, to say that it acts to the right in the northern hemisphere, but to the left in the southern. The reason for this is not found in a change in the direction of the force, but only in a change in our way of looking at it. It is as if one should look at the face of a watch in the northern hemisphere, and say that the hands turn to the right, and then, on going to the southern hemisphere, look at the back of the watch, and say that the hands turn to the left. Let us therefore suggest that the geographers of the southern hemisphere look at their winds and storms and streams from the upper side, just as they look at their watches; and, although this would involve them in the slight inconvenience of standing on their heads it would give them the moral satisfaction of seeing that the deflective forces of the earth's rotation, as well as the hands of their watches, always "make for the right."

THE SUN'S HEAT.—In a recent lecture on "Solar Physics," at the Royal Institution, C. William Siemens gives his reasons for setting the temperature of the photosphere of the sun at about 2,800° C., instead of about 10,000°, where Rosetti and other late investigators put it. He agrees, in this lower estimate, with Violle, St. Claire, Deville and Sir Wm. Thomson, and thinks the solar temperature cannot much, if at all, exceed that of the most powerful electric arcs. He recognizes fully the fact that a temperature higher than 3,000° C. would be absolutely conclusive against his theory that the solar heat is due to the recombination or burning of compound gases at the surface of the sun. He bases his estimate of the solar temperature upon three foundations: First, the behavior of a carbon rod and a small gas flame in the focus of a reflector exposed to the sun; second, on a comparison between the spectra of various lights—for instance, the Argaud burner, an incandescent lamp, the electric arc, and the sun itself, as observed by Langley on Mount Whitney; third, upon experiments on the relation between temperature and radiating power, made by means of a long platinum wire heated by an electric current.

HEAT DUE TO MAGNETIZATION.—Some 40 years ago, observes *Nature*, Dr. Joule raised the question whether a body that is magnetized undergoes any change in its temperature; but the question has not yet received a definite solution, the rise of temperature which accompanies magnetization being ascribed by some to induction currents, and not directly to magnetism. While recognizing the influence of the former, Mr. Borgman has tried to show that there is also a change of temperature due to magnetization and demagnetization, and that the amount of heat thus disengaged is proportionate to the squares of the temporary magnetism. M. Bachmetieff, having made at the University of Zurich an extensive series of experiments, arrived at the conclusion that magnetism, by itself produces variations of temperature in magnetized bodies, and that this "magnetic heat" is equal to the product of the magnetic moment by the magnetizing force multiplied by a constant; it increases, also within a certain limit, with the frequency of the interruptions of the magnetizing current, and increases still more when the direction of the current is alternately changed. Its amount is not equal throughout the length of an iron cylinder, reaching its maximum about its middle and decreasing toward its ends. Its cause must be searched for, in purely mechanical forces, and it depends upon the speed of rotation of the molecular magnets.

PREPARATIONS OF ALUMINUM. According to an account in *Chemiker Zeitung*, ferro-silicium is mixed with fluoride of aluminum in equal proportions, and the mixture is exposed to a fusing heat. The materials decompose each other; and volatile fluosilicium are produced, the latter two bodies being alloyed together. In order to extract the valuable aluminum, a copper alloy is formed by melting the iron alloy with metallic copper; by reason of a greater affinity of the copper for aluminum this is secured, leaving with the iron only a slight residue of aluminum. When the fused mass is cold, copper, bronze and iron have so settled that both bodies can be easily separated. In place of the pure fluoride of aluminum, chloride can be used, when chlorsilicium and iron aluminum alloy are formed. If in practice the chemical reactions above outlined are found to hold true, this patented process promises to be of considerable value.

DECAPITATED INSECTS.—S. R. Canestrini has been experimenting upon the defects of decapitation upon insects. Butterflies were able to use their wings eighteen days after they had lost their heads. Crickets leaped on the thirteenth day after they had been beheaded, and the praying-mantis showed signs of life in fourteen days after the head had been separated from the body. He gives still more singular observations, to show that the head in insects cannot be subject to the same perpetual strain as the head in mammals in guiding the motions of the body.

BY MICROSCOPIC EXAMINATION of the cross-section of a single human hair, Prof. E. B. Taylor states, the race of the individual to whom it belongs can be determined. Pruner's method shows whether it is circular, oval or reniform. Mosely has explained how the follicule curvature may be estimated by the average diameter of the curls. Sorby's plan gives the coloring matter. Dr. Muller, of the Novara expedition, has published a classification of man, primarily arranged according to the hair, with a secondary division according to language.

SOLAR HEAT.—Hirn, the French astronomer and physicist, has devised an apparatus for determining the actual calorific power of the solar rays. An alembic of copper containing sulphuric ether is exposed to the sunshine. The heat absorbed volatilizes the liquid, which is condensed in the alembic. Regnault's formula is employed to calculate the solar heat absorbed from the quantity of liquor condensed.

BLUE AND RED RAYS.—As to the rays of the solar spectrum, Prof. G. Forbes still maintains that the blue rays travel faster than the red, the assertion of M. Cornu to the contrary notwithstanding. It may be remembered that M. Cornu thought that Prof. Forbes was misled by the nature of his apparatus.

MAGNETISM.—Prof. Hughes explains the phenomena of magnetism by a simple rotation of the particles of iron. He gives a full exposition of his theory in a paper read before the Royal Society, London.

MAN AND BIRD.—It has been figured out by Dr. Wood, the eminent student of nature, that if a man could eat as much in proportion as a bird he would consume a whole round of beef for his dinner.

Passing Events.

There is some little excitement about the New River mines, which are about 85 miles from Eureka, Humboldt Co., in this State. The quartz is gold-bearing, and there are hopes that the new camp will be a permanent and prosperous one.

There are two "booms" going on in Colorado just now, one near Breckenridge, caused by the discovery of large and reputedly very rich placer fields, and the other in the Tomichi district, Gunnison county.

Three fires in as many mining districts within the past few weeks have given "set-backs to each of the localites, but where the mines are at all prosperous, the camps will be rebuilt in better shape.

The opening of the Mechanics' Fair in this city occurred on Tuesday, an account of which is given in another column. The exhibition this year, when all arranged, is expected to be much superior to former ones, and will show our industrial advancement in very many branches.

The strike in the Quijotoa mines, Arizona, reassures many persons concerning the future of that important camp.

PERSONAL.—We received an invitation to attend the wedding of Prof. John A. Church and Miss Jessie Angeline, daughter of Mr. Bryant M. Peel, at Los Angeles, July 30th, and are pleased to extend congratulations to the happy couple. Prof. Church is evidently now settled on this coast.

Water Rights in California.

The system of water rights built up by the early decisions of the courts in this State was not based on either the common or the civil law rules regulating the rights of riparian owners or the use of water in running streams, but was, as Chief Justice Murray said in one of his decisions, "based upon the wants of the community and the peculiar condition of things in this State, for which there is no precedent, rather than any absolute law governing such cases." This remark was repeated in other cases, and the fact is admitted by Mr. Justice Heydenfeldt, who first made the wide departure from the common law, in the absence of legislation, in the principal case of Irwin *vs.* Phillips; and also by Mr. Justice Burnett, who apologized for the error, and then justified it in a certain decision in which he says "that, being left without precedent or specific legislation, the courts were compelled to apply the analogies of the common law and the *more expanded principles* of equitable justice."

In the same opinion of the Chief Justice (in the case of the Bear River Co. *vs.* York M. Co.) he remarks: "The absence of legislation on the subject has devolved on the courts the necessity of *framing* rules for the protection of this great interest; and in determining these questions we have conformed as nearly as possible to the common law. In a case, however, which occurred in 1865, where there was a controversy about a water right, Mr. Justice Sanderson combated the idea, which he said prevailed, that the rules of common law touching water rights have been materially modified in this State upon the theory that they were inapplicable to the conditions existing here. He says "the notion is without substantial foundation. The reasons which constitute the common law remain undisturbed. The conditions to which we are called upon to apply them are changed, not the rules themselves." Judge Heydenfeldt said substantially the same thing in one of his early decisions.

Another justice decided, however, that the law as applied in water cases, that a riparian proprietor is entitled to have the stream flow in its accustomed bed, without diminution or alteration, is not applicable to miners or ditch owners, because the conditions upon which its rule is founded do not exist in their cases, as they seek water for another purpose—that is, diverting it from its channels for mining or irrigating. But the ground of the misapplication of the common law principles with earlier cases, says Gregory Yale, matured into the settled law of the State is, in the very example given as an exception to the rule, namely, its diversion of the water in running streams from their beds, in violence of the rights of riparian owners.

In the principal case of Irwin *vs.* Phillips the broad doctrine was announced for the first time in any system of jurisprudence, that the right of the unlimited use of water in a running stream vested in the first appropriator, whether a riparian owner or not with the correlative right to divert it to any extent, for sale or other use, and that subsequent locators even for mining purposes, upon the banks of the same stream, as riparian owners, could only acquire an interest in the water for any purpose subordinate to the rights of the first appropriator, provided any water was left.

This is the principle at the foundation of the hydro-mining rights in this State, and applies to all other cases of the appropriation of water for any legitimate purpose, subject to the rules originating in the same manner, modifying the general doctrine.

In a case involving a question of water rights, decided by the Supreme Court last week, the following points were made:

A lawful appropriator of water is entitled to an injunction against a trespasser.

Each and every tenant in common has the right to enter upon and occupy the whole of the common property and every part thereof, and may recover the whole from a trespasser.

The circumstance that the time or times when the plaintiff is entitled to use the waters in question, has not, as between him and his co-appropriators, been fixed in any way, does not concern defendant, who is a mere trespasser.

Co-tenants being entitled to use *all* the waters, when an outsider diverts any from them, or any one of them, he is injuring all and each of them.

A Mexican Mining Code.

The Mexican code of mining laws is the oldest on the continent, and when settlers on this coast began to mine, many of the Mexican customs were adopted. In fact, the United States had no laws on mining, until after the discovery of gold in California. The Mexicans who were here were the only persons with experience in this direction. General H. W. Halleck, long a resident of this coast, wrote a work in 1859, on the mining laws of Spain and Mexico. The study of this code was a matter of special interest in California, because the territory had previously been governed by Spanish and Mexican laws. In 1848, ten days after the treaty with Mexico was signed by the commissioners, but then unknown to the military officers of California, and shortly after the discovery of gold, Col. Mason, as Governor, issued a remarkable proclamation concerning the mines, operating directly, as he supposed, upon mining titles; and, by a wondrous forsight, while committing a blunder in fact, settled the laws as the Supreme Court held fourteen years afterwards, in Castellero's case: "From and after this date, the Mexican laws and customs, now prevailing in California, relative to the denouncement of mines, are hereby abolished. The legality of the denouncements which have taken place, and the possession obtained under their seventh occupation of the country by the United States force, are questions which will be disposed of by the American Government, after a definite treaty of peace has been established between these two countries."

Under President Tyler's administration the topic of mining was first presented by the Executive to Congress. He thought the establishment of a mint would afford facilities to miners and to the Government in disposing of mineral lands. He also recommended a geological survey and that the mineral lands should be divided into small lots valuable for mining. Our interest in Mexican laws thus ended, though many Mexican mining terms and customs were drafted into our mining literature and industry.

It seems now that the Mexicans find their mining code, so long in existence, is faulty, and they are about to remedy it. They will doubtless graft into their proposed code many features which experience has proved correct in this country. General Pacheco, the Minister of Public Works of Mexico, wishing to collect full mining statistics, and to utilize the knowledge of miners for the publication of a new mining code, recently called on all the Governors of the different States to revise the two projects to that end submitted to them. The following Governors and engineers will do so: Aguas Calientes, Mining Engineer Miguel Velasquez de Leon; Colima, Justinio Solorzano; Chiapas, Manuel Carrascosa; Durango, Carlos Bravo; Guanajuato, Miguel Rul; Guerrero, Alberto Garcia Gronados; Hidalgo, Gabriel Mancera; Jalisco and Mexico, Mariano Barcena; Michoacan, Manuel Urquiza; Morelos, Leonardo Fortuno; Nuevo Leon, Emerterio de la Garza; Oaxaca, Licentiate Manuel Dublin; Puebla, Antonio del Castill and Nicolas Islas Bustamente; Queretaro, Lic, Jose Sinares; Linaloa, Ignacio L. Vallarta; Sonora, Jose Patricio Nicoli; Tabasco, Lic, Joaquin Arcalde; Tamaulipas, Francisco B. Leal and Enrique Montamar; and Tlaxcala, Joaquin Salazar and Thomas Murphy.

When a Relocation is a Trespass.

Miners making relocations of mining ground should be careful to find out that the said ground is legally abandoned and open to relocation by failure to do assessment work, etc., before they take the trouble to claim it. The Supreme Court of Colorado has just re-affirmed its former decision that actual possession is prima facie evidence of title, and that entering upon premises in the actual possession of another for the purpose of performing the acts necessary to constitute location and possession, amounts to a trespass, and cannot form the basis for the acquisition of title. Whether the location of the party in possession be valid or not, their possession is sufficient to defeat a recovery by the party entering to make a new location. In this decision, the principle of "possession being nine points of the law" is maintained, and miners should bear this in mind when desiring to make relocations.

The same court also decides that mine owners are not responsible for recorders' mistakes. A prior location of a mining claim is not invalidated by a mistake of a recorder in recording such location by a name somewhat different from that stated in the certificate of location.

A Reversible Steam Gang-Plow.

There is in process of construction at the Union Iron Works, in this city, the engine and machinery for a steam-plowing plant, on an improved system, the invention of Mr. Wm. H. Foye, who has just received his patents through the MINING AND SCIENTIFIC PRESS Patent Agency. The machinery is being made for the Pacific Steam Agricultural Manufacturing Co., of this city, an organization with the following officers: Irving M. Scott, President; Josiah Stanford, Vice-President; Moses Hopkins, Treasurer; C. W. Brooks, Secretary; and Wm. H. Foye, Superintendent. The other Directors are ex-Governor Geo. C. Perkins, Hon. John F. Miller and Ariel Lathrop. Mr. Foye has several patents on steam-plowing machinery, but the plow just patented is far superior to any other, and has a number of advantages over the Fowler system, being simpler, lighter, smaller and much more easily moved and managed.

The Fowler plowing plant costs, laid down here, $40,000. This apparatus, with two plows, harvesting and thrashing machinery, etc., will cost about one-sixth of the other system. The machinery is so arranged that when the plowing and sowing is done, and harvest time comes, the same engines used for plowing can be used for cutting and thrashing the grain.

The plow is of that class of gang-plows which are hauled across the field to be plowed by means of engines placed at one side or both sides of the field, or by other suitable means; and its object is to provide a plow to be operated by steam and wire cable that will plow forward and back upon the same landside without turning around. It consists of a series of right and left-hand plows, secured at the proper angle on opposite sides of the plow-beam, with the points standing in the opposite direction to the line of travel. The beam may be provided with any number of plows cutting different widths of furrow, or any other tools used in working the soil. The plow beam is square at the ends, and provided with a bearing at equal distance from each end, which holds it firmly in a position to swivel around in the arc of a circle, and when at a point parallel with the side frame, it revolves or capsizes, bringing the right-hand plows that have completed their cut to the top of the beam, exchanging places with the left ones, so that the plow may start on the return cut upon the same landside without turning around.

The frame in which the plow beam is mounted is provided with slots at each of the four corners, through which the end of the plow beam works, and is depressed to give the required depth of cut, and elevated for the purpose of changing the position of the plows from right to left-handed work. Means are provided by which the beam is raised in the slots at each corner of the frame; and there are channel-ways, in which the ends of the plow beams travel from a right to left-hand corner. There are also castor-wheels which support and carry the plow and steering-gear by which it is guided across the field, as well as means by which the beam is supported at the bearing in the center of the frame.

This beam plow is only 14 feet long, whereas the English plows to do the same work are 36 feet, and are proportionately heavier. The details of construction are very much simplified. The machinery will be completed in a few days, and thorough trials are to be made in a practical way.

Academy of Sciences.

President Davidson, who returned from the East last week, occupied the chair at the meeting of the Academy of Sciences on Monday evening.

The President reported having received a letter from Lieut. Doty, commanding United States Revenue Marine steamer *Corwin*, reporting that on their way to Kotsebue sound they stopped at Oonalaska, in latitude 54 degrees north, and after leaving there, May 20th, they spent the following day examining Bogosloff island, in Behring's Sea, north of Oonimak. Photographs and drawings of the new island were exhibited.

Prof. Davidson then spoke of his recent visit to the Grand Canyon of the Colorado at a point 160 miles east of the Needles, on the Atlantic and Pacific Railroad, which required only 21½ hours' time, and an expense of $10 for horses and guide and 75 cents a meal. He saw vertical walls 2,700 feet high, 6,200 feet above sea-level, where the Colorado river was 190 feet deep, and cannot imagine anything grander than the effect of sunset shining on these walls only 10° from vertical, composed of different colored rocks, red sandstone and the black overhanging rocks. The temperature was 136 Fahrenheit.

Capt. William Lund, of the Hawaiian brig *Dora*, presented a collection of water snakes found 10 miles at sea; also a live *Iguana*, 12 feet long, or species of boa-constrictor, found by him on Tres Marias Island.

Mechanics' Institute Fair.

The annual exhibition of the Mechanics' Institute was formally opened on Tuesday last. The exercises took place at the Grand Opera House. Mr. P. B. Cornwall, President of the Institute, in the course of his remarks gave a brief review of the history of the Institute. He said that just twenty years ago, after nine years labor they were ahead only $11,588. He said:

It would weary you to listen to the statistics which show the labors and gains during the past twenty years, but the visible and material results are evidenced by the substantial three-story brick library building on Post street, in which is a library of over 35,000 books, selected with great care, and to which large additions are made each month of new and valuable publications; and by the entire block of land bounded by Hayes, Larkin, Polk and Grove streets, with its vast exhibition building fitted with powerful engines for driving all kinds of machinery.

It is safe to estimate in dollars and cents the net value of the property of the Mechanics' Institute to-day, at half a million dollars, and to say that with careful management it is likely to become within the next twenty years one of the most wealthy and useful institutions of its class in any country. It is contemplated to build when the proper time comes, a spacious and convenient library building on the corner of Larkin and Hayes streets, with large rooms fitted for lectures, technical classes and other purposes.

The Institute owes the larger part of its material prosperity to its Industrial Exhibitions, and something to the faithful and gratuitous services of its founders and their successors in the management of its affairs. Besides its financial solidity, it has a sure foundation in the hearts of its members, and, I hope, and believe, has the sympathy and good wishes of the people of this city, who have witnessed its early struggles and are glad of its success.

The oration was delivered by Mr. Frank M. Pixley. It is a scholarly production, but space forbids making more than a few extracts. His remarks on the work of the mechanic were specially forcible:

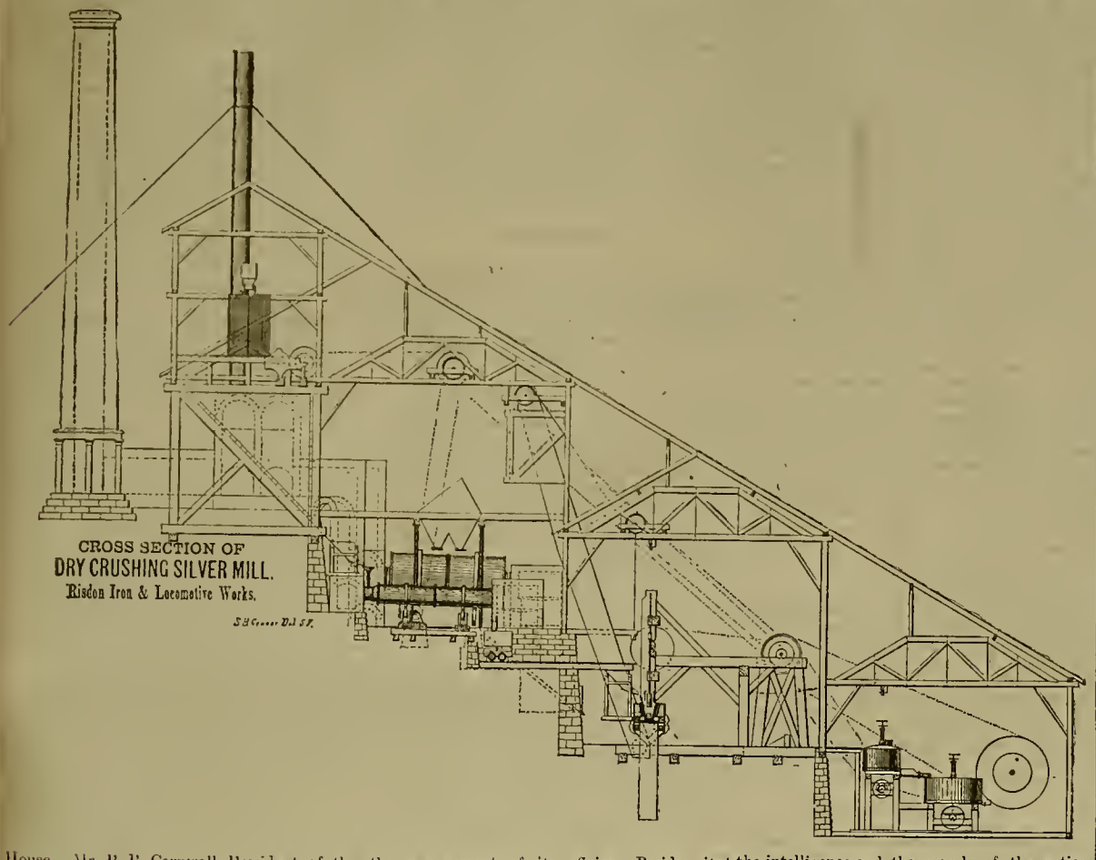
The work of the mechanic is seen in grander results than in the product of his mechanical skill in the manipulation of material things. It is observed in the social life that surrounds us, in the fabric of law, order and Government, without the protection of which there is neither safety, progress nor comfort in existence.

California is a State and this Pacific coast an Empire of magnificent destiny, and in that future you gentlemen of skilled trades are to enact a responsible part. You, with the other workers, compose the great middle class of society upon whom devolves most of the duties and responsibilities of upholding the Government and maintaining the law. You are so placed in the organization of society that in your own interests, and in your own defense, you must shield the community from the follies of aggressive, indolent wealth, from the actions and greed of corporate power and all the evils necessarily incident to wealth and power.

The middle class is that in which the wealth, the intelligence and the morals of the nation are found. It is the great voting majority of the country, and upon its political course hangs the destiny of the Republic. The sum total of millionaires is small when compared with the accumulated wealth of the great industrial class. The intelligence of the schools, the culture and learning of the educated few, is not to be measured for practical usefulness with the common sense intelligence of the great middle class. The place to look for any virtue is not among those who inherit wealth, or the class that indulges itself in criminal idleness.

It is the mechanical man more than any other of the business or laboring class that thinks. The mechanic is compelled to think as he labors, necessarily, and naturally he considers whether by some ingenious mechanical device or some skillful appliance he may not render his labors less severe or more satisfactory in results, whether he may not attain better ends in lesser time by some labor-saving invention. He is the father of a family, the owner of a home; he is a citizen called from his duties to perform the duties which society demands; he must serve on juries, pay taxes, serve as *posse comitatus* in war; he must serve his country; he is an elector; he has lives to guard, property to protect and rights to defend, and as he toils he thinks. He can work with his hands and think. There are very few who think—they are many who think they think—and when from the pulpit, the rostrum or the press, there is suggested some pregnant thought, the mechanic that has the brains has the time to think it out to a rational conclusion.

I say the mechanic that has brains, for, unless the man has brains, he is not a mechanic, he is a worker and imitator, but he is not a mechanic. Professional men consider specialties. The merchant as a class, thinks but little, the farmer, as a class, thinks less, the laborer who works only with his muscle not at all. There are splendid exceptions to the rule as we have generalized it, of great active-minded, noble men in all the classes named, and from these then arise those superior minds that compose a class that rules the world, a class embracing the great thinkers, philosophers, scientists, statesmen and heroes, the great inventive geniuses of the world, the great guiding, directing minds, who in all past ages have, and in all future time will, control the destiny of mankind.



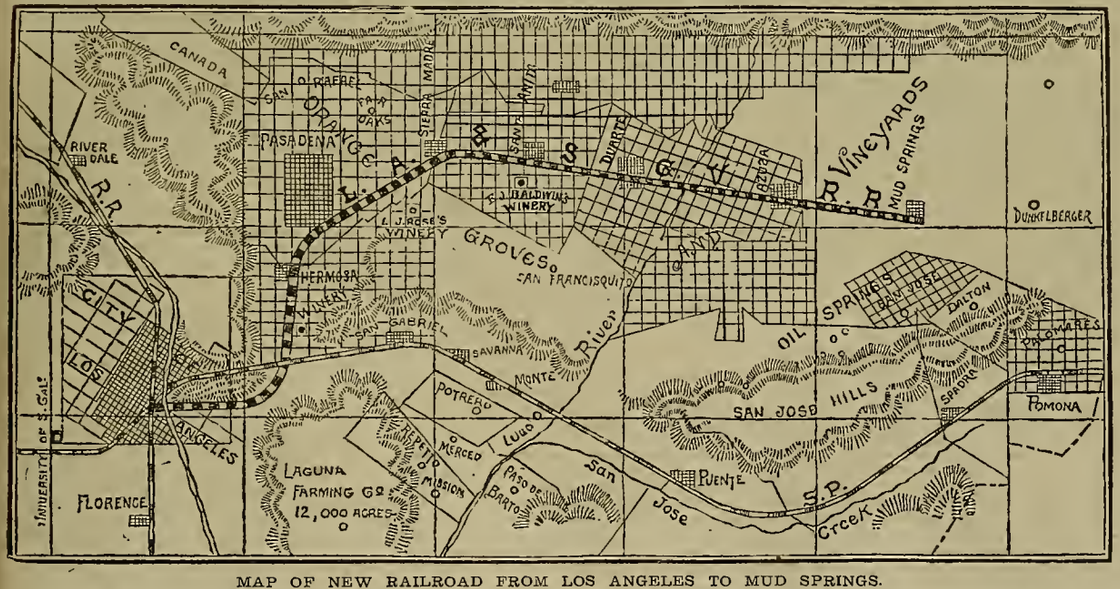
Hoisting Ropes.

A noted writer on mining topics, who has been visiting the Continent and noting such things as would interest mining engineers, states that notwithstanding the frequent breaking of aloe fibre drawing ropes, the Belgian miner clings to the opinion that they are superior, from the point of view of safety, to wire ropes. And in France, where such accidents are relatively rare, it would be hard to shake the confidence of the collier in this vegetable material. In both countries there is a distrust of wire ropes not easily to be accounted for except by attributing it to the influence of habits and custom. It is contended, in justification of the opinion, that the metal of wire ropes undergoes rapid change when subjected to the vibrations of violent shocks to which a drawing rope is continually exposed, and that it is very hard to perceive by mere inspection the existence of conditions that lead to rupture. The weakening of a fiber rope is said to be a gradual process, and by measuring the extent of stretch and the consequent diminution of the diameter, the true stage reached in that process may be easily and accurately ascertained. But these indications are not found in wire ropes. It is strange that this distrust of the wire rope has not been removed, or at least diminished, by the experience obtained in England and in Germany, where it is in general use. But the fact remains that in only a few instances has the fiber rope been discarded, and in these cases it has been done with much misgiving. Mention the wire ropes to the French miner and you are answered by a determined shake of the head.

In Germany it is a common practice to interpose springs between the drawing rope and the cage. A mining engineer of much experience in that country states that this practice, which is fast becoming general, adds very considerably to the life of a rope by relieving it of the shocks of starting, and that as a security against accidents from breakage of the rope these springs have been found to be of great value, inasmuch as they notably lessen the destructive effects of abnormal shocks.

A New Railroad Project.

We give herewith a map of a new broad guage railroad projected from Los Angeles to Pasadena, and then along the northeastern boundary of the San Gabriel valley, over the high mesa land at the foot of the mountain, passing through the vineyards of Gov. Stoneman, and Mr. Rose, touching at the Sierra Madre Villa, passing just to the north of Baldwin's winery, and thence northwesterly and easterly to Mud Springs. Here a halt will probably be made for a short time, until that part of the road is placed in good working order, and business upon it well established. It will then probably be continued onward along the northern edge of the valley to San Bernardino, which is the ultimate proposed terminus.



MAP OF NEW RAILROAD FROM LOS ANGELES TO MUD SPRINGS.

The line has been run and the center stakes driven and a profile prepared as far as Mud Springs, and negotiations are now in progress to put the work of grading and track-laying, if indeed they have not already been completed, under immediate contract. If the present proposed arrangements are carried out, as we presume they will be, the track will be laid and the road ready for operation to Mud Springs early the coming winter. Careful estimates of the business that would naturally come to such a road, show that it would in all probability be a paying investment from the start. Such a road is much needed, and will greatly assist in developing and building up the localities through which it will pass. It will form a most convenient means of access to Pasadena and the Sierra Madre Villa, both of which places are rapidly growing into importance as places of resort for invalids, where all such can visit or remain with equal benefit, summer or winter. A large hotel, calculated to accommodate several hundred guests, is already projected at Pasadena, and it is expected will soon be constructed, which will be fully equal, if not superior, to the Hotel del Monte, at Monterey.

The Lost River Region.

There are many prospectors in the Lost River country, where three towns bave already been laid out—Alder City, Houston and Carbonate. The Wood River *Times* says Alder City is beautifully situated on an undulating plain, and susceptible of cheap irrigation. The site is owned by W. T. Riley, Texas Angel, Moses Biddy and Mr. Eggert, of Hailey.

Houston is two and a half miles above Carbouate, and the site belongs to the Bruner Brothers, Frank Brown, Mr. Williams and M. H. Vanlandingham.

Carbonate is two and a half miles farther, and nearer many of the mines than either of the other towns. The site is owned by W. G. Seamands, J. H. McAllister, and others.

There are many good mines within a few miles of the town above mentioned. The enormous copper vein of the Bruners, Williams, Brown, etc., is already attracting the attention of capital every where, and will undouhtedly sell up in the millious some time.

H. Curtis, C. Ross, W. Yates and Jesse Stinsou are opening up some very fine prospects.

Messrs. Peterson, Tarbitt and Canady have the Mammotb and Copenhagen claims, up Alder gulch. On the first named a 75-foot shaft shows a 6-foot veiu of galena and carbonates; the second has a tunnel 100 feet long, showing 4 feet of ore, averaging 90 ounces.

G. W. Rose and Mr. Harrison own the John L. Sullivan—a 3½-foot vein of galena and carbonates, with a 10-foot shaft. They also own the Found-at-Last and Nature, the former a 4-foot and the latter a 3½-foot vein.

Jack Woodruff's 30-foot shaft on the Alice shows 3 feet of ore, and the Mayflower, 10-foot shaft, 4 feet of ore.

Owen & Hall own the Isabella, shaft 30 feet deep, showing good ore. Vein carries 15 feet of solid ore. This is also a mammoth mine.

Near the head of Alder gulch the Grand Prize, owned hy Jones & Herndon, is located. The vein is 30 feet wide. and shows 18 feet of ore. There are all of 400 tons of ore on the dump, and the property is bonded to E. Egan, of Salt Lake, for 30 days from last Monday, for $40,000.

Jonas & Herndon also own the Hidden Treasure, 10 feet wide, with 5 feet of ore.

Stoner & Reeser owu the Hill Top and Gray Eagle—a very fine prospect.

A short distance above Alder creek, on Lost River, W. H. Burnett owns the Denver & Rio Grande and other claims. These show a large body of carbonate.

Above Carbonate City, Dow & Platt own the Pilot, which shows a 60-foot veiu, of which 4 feet is high-grade ore.

James Viar & Co.'s Black Daisy has a 60-foot shaft, tunnel and open cuts; the vein is 2 to 20 feet in width, with 500 tons of high-grade ore on the dump.

Highly Phosphuretted Pig Irons.

The following note by Prof. N. W. Lord, of Columbus, Ohio, was read before tbe American Institute of Mining Engineers:

There bave been made at one or two places in Ohio, during the last year or two, some irons of rather unusual phosphorus percentages.

The first of these which I had occasion to examine came from Moxahala furnace, in Perry county. The furnace was built originally to smelt an ore found in large deposits near its furnace in the "black band" horizon. The deposit was easily exposed by simple "stripping;" it was from six to eight feet thick, being a blue carbonate ore very free from silica. This ore yielded, on analysis, from two to three per cent of phosphorus when carefully sampled.

The furnace company had trusted entirely to old analysis made on "out-crop" ore, well weathered, and received all other results with differences. The result of the first run of the furnace was an iron in large whitish-gray crystals, and so brittle that it could be pulverized in a mortar. This iron contained 4.90 per cent phosphorus. A limited quantity only was made, which was gradually disposed of as a great "softener" to foundries. The Moxahala furnace was subsequently run on Lake Superior ore mainly.

The second case of such iron occurred last summer at Mt. Vernon furnace. A deposit of what was locally known as "Hallelujah" ore was opened for the furnace. This ore was a blue carbonate similar to the first described.

The iron made was pure tin-white in color, and showed large crystals without a trace of the grain of ordinary pig iron. It was supposed at the furnace to be spiegeleisen, and was sent to me to be examined for manganese, of which, however, it only contains a small amount. It, however, contains phosphorus 4.30 per cent; silicon, .05 per cent.

It is remarkable in its very low silicon percentage. This element was determined by Dr. Drown's nitric and sulphuric acid methods.

The iron contains no graphitic carbon, but dissolves completely in nitric acid to a brown solution. The carbon was not determined, owing to pressure of other work.

The above facts show that when basic steel manufacturers want an iron with little silicon and four to five per cent of phosphorus we can furnish it *ad libitum*.

Asiatic Cholera.

There is perhaps no term in the English language packed with more horror and dread than the word cholera. Its approach is so silent and mysterious, its ravages so widespread, and its attacks so formidable to the ablest medical science, that it well deserves to be called the crowning terror of the world. As nearly a generation has grown up since its last visit to this country, many of our readers may be practically ignorant of this terrible disease.

There are three well defined species of the disease; cholera morbus, cholera infantum and the Asiatic or epidemic cbolera. It is the last form that raged last year in Egypt, is now raging with fatal results in Southern France and threatens Europe and America. It is well named the Asiatic cholera, as its breeding places are known to be the marshy lands of India, where it is formed and bred hy the filth, squalor and wretched food of a crowded population. It has been known for centuries, and in 1817 it left its nsual home and set out on a pilgrimage of death that twenty years of horror and the boundaries of the globe alone could check. In 1826 cholera destroyed 150,000 persons in the city of Bombay alone. The inhabitants of Madagascar, the eastern coast of Africa, and the islands of the sea, next fell victims to the pestilence, and one year later it had advanced into Arabia, Persia and Asia Minor. In 1829 Southern Russia and Moscow, were overtaken, and three years after it had found its way into the heart of Great Britain. The first appearance of cholera on this continent was in Quebec, in June, 1832, and two years later the yellow flag of death was flying in Montreal. The fearful pestilence broke out in New York, June 21st, and raged with violence for three months.

In spite of the strictest quarantine along the rivers, canals and ways of travel, it soon spread to all the cities and large towns of the Union, digging grave-yards in a day. In 1834 there was a renewal of the epidemic, but in a modified form, and it gradnally disappeared. In 1849 it again reached our shores and raged with more or less intermission up to 1853, sweeping away thousands, or more truly, hundreds of thousands of victims. It has since appeared in this country, but not to an alarming extent, and for nearly twenty years has not been here at all.

Dr. Koch, the eminent German physician, by patient experiment, has succeeded in tracing the cause of this terrible disease to an infinitely small parasite. He was led to this discovery by verifying the fact that a large number of the most fatal diseases are owing to the same cause. These iuclude typhus and typhoid fever, small pox, diphtheria, scarlet fever, yellow fever, and even consumption—all of which are propagated hy living organisms. These microorganisms are about the one-thousandth part of an inch in size, and most of them, under the microscope, look like fine rods of various lengths and sizes. They can he isolated and cultivated on a soil made of gelatine and the watery portion of the blood. There each variety may be developed into its own peculiar shape and form, Some form little mounds, some adhere together like the blood corpuseles, and others assume the most strange and grotesque shapes. One, supposed to cause typhoid fever, is called bacillus; those found in the decaying tissues of the lungs, in consumption, are the micrococci.

Dr. Koch, following up this discovery, applied it to the study of cholera for a long time without success; but at last succeeded in demonstrating that this disease is governed hy the same law, and the cholera bacillus is now an established fact. And what seems remarkable, this bacillus is not found in the blood of persons suffering from the cholera, nor in that of those who succumb to the disease, but is only found in the intestinal canal, where they accumulate in astonishing numbers.

This discovery explains the cause of the numerous rice-water discharges that so long seemed incomprehensible, and why the use of disinfectants first proposed and tried in London produced such good results; they destroyed all low organisms and especially hacteria. It is found, however, that some disinfectants are better than others, the effect probably depending upon the kind of bacteria they are called upon to kill. For instance, quinine acts as a disinfectant mainly on the bacteria of decomposition. From a great number of observations made during the last great cholera epidemic in London, the physicians came generally to the conclusion that sulphuric acid and the tincture of the chloride of iron were specially destructive to the cholera bacillus.

But the greatest preventive to the origin and spread of cholera is, undeniably, cleanliness. In Oriental countries it is eminently a disease of filth, and its ravages have always been greatest where squalor, wretchedness, had food and dirt abounded. It, therefore, clearly becomes the imperative duties of the authorities of our cities and large towns to prepare for the visit of this dread epidemic. It is the hight of folly to assume that cholera can he kept out by quarantine and instructions from the State Department. We should he prepared to meet it with the most effective preventives, for in this disease, as in all others, an ounce of prevention is worth a pound of cure. Among the many suggestions that have been made, none are more sensible than those of Sir Robert Rawlinson in a recent number of the *Pall-Mall Gazette*. Mr. Rawlinson has passed through several seasons of cholera, was in the Crimea when the disease raged so fatally there, and his opinions may he regarded as those of an expert. The prime element of the cholora, he says, is human life, "massed on swampy or low, undrained sites, having been long occupied, unceasingly fouled and deusely crowded." And he adds: "But drain these sites, remove foul privies and cesspools, regulate the tenements, and at short intervals cleanse, ventilate and limewash the slums, and cholera, if introduced, will not spread." But he places more reliance upon systematic and thorough scavenging. After finshing the main sewers, providing plenty of pure water in the house, perfect closet accommodation and drains to remove waste water and impurities, the scaveuger must thoroughly do his work. "All that water can remove must he washed away; all matter liahle to become putrid must be consumed hy fire."

Local Glass Works.

The San Francisco and Pacific Glass works on King street near Fourth have heen almost entirely rehuilt within the past few months so as to adapt them to the manufacture of fine goods of flint glass. They propose to make table ware, har goods, jelly glasses, retorts, chemical ware, all kinds of pressed goods, druggists shop ware, lamps, lamp chimneys, etc. They propose also to do grinding and make stoppered ware, such as tincture bottles, etc. The factory will he fully equipped. They will make colored glass also, such as ruhy, blue, turquois, etc. They have in eight crucible furnaces with a capacity of four tons of glass per day. Some 75 hands will be employed in the flint glass works; though part of the old works will still be kept on rougher qualities of glass as at present—hottles, demijohns, etc.

Hands for these new works have been brought from the East—hlowers, pressmen, cutters, engravers, etc. They expect also to make fish globes, candy jars, etc. Only white labor will be employed at this work.

They have 200 men at work in tbe factory now making fruit jars, jugs, bottles, castings, etc.

The works can procure no suitable sand on this coast, so have to import it from Belgium. They have 1,000 tons of sand ou hand and 400 tons more on the way. Tbe soda and chemicals come from Europe also.

This enlargement of the glass factory and its new features will make it a very complete establishment and one of much use to the people on this coast. It will stop much of the large importation of glass now going on.

CALIFORNIA BUILDING STONE.—It was originally iutended by Mr. J. C. Flood to build his mansion iu this city out of stone quarried in this State. Samples of stones from all parts of the State were submitted and over 50 of them were tested. A number were found to answer all requirements, among them heing varieties of granite, marhle, sandstone, brownstone and the so-called blacklog stone. But when matters were reduced to a husiness basis it was found that the cost of getting this stone to San Francisco in the desired shape would he so high that three times the required amount could he brought from the East for the same sum of money. For instance, it would cost as much to break out California marble and ship it to this city over the railroad as it costs to hring marble from Italy, leaving out of consideration the fact that the latter can be worked much more easily. It was the same with Penryn granite, although this variety of stone was undesirable for other and personal reasons also. Of brownstone there were two excellent samples. One came from an island lying south of San Diego, off the coast of Lower California, and the other from Solano county. In both cases the quarries required to be opened, their owners expecting that J. C. Flood should furuish the money, although they were not willing to give him an interest in the property. The negotiations with the owners of the blacklog mine resulted unsatisfactory for the same reason, although a company was incorporated to quarry the stone, which is of a hluish-gray color and is found just north of the California line iu Oregon. But in this case the building of 10 miles of railroad and a breakwater were found to be necessary, both operations of far greater magnitude than the huildiug of the house itself. It was for these reasons that it was finally decided to go East for building material. The negotiations, however, have at least shown that California possesses abundant and choice building material and that it requires only a little enterprise and capital to make use of these resources.

THE Los Angeles Board of Trade, iu a late memorial to Congress, gives some interesting county statistics. In this document the number of acres of vineyard is given at 20,000, which produced 4,000,000 gallons of wine and 250,000 gallons of hrandy in 1883. There are iu the county 526,000 fruit trees in bearing. The cereal products are given at 2,000,000 hushels of wheat 1,500,000 hushels of corn, and 1,000,000 bushels of harley. The petroleum district, extending into Ventura county, includes 200,000 acres of land, from which there was pumped, in 1883, $1,000,000 worth of coal oil. In the district made up of Los Angeles, San Diego and San Bernardino counties there are 9 breweries, 10 cigar factories, and 46 grape brandy distilleries. The mineral products include gold, silver, lead, iron, copper, tin, lime, granite, asphaltum, gypsum, coal, borax, salt and cream tartar.

THE GREAT EXPOSITION.—The Exposition at New Orleans is attracting the attention of the press in all parts of the country and abroad. Almost every newspaper has something to say about the preparations that are being made to further the work of State or local associations. The special representatives of the Exposition, commissioned hy President Arthur, for the purpose of procuring exhihits, have found the newspapers ready to report speeches and print the latest news relating to the World's Fair. This circumstance, no douht, springs from the fact that the people throughout the land read with much interest, all that is printed concerning this great enterprise. By the wide-spread influence of the press, the Exposition is known and talked about in India, Australia, on the banks of the Congo, in the South American republics, and in the frozen regions of the North. Seeming impossihilities have heen overcome, and the scheme limited to a cotton exhihition at first, has been enlarged by degrees till it now embraces a grand exposition of arts, manufactures, mines, agriculture, and in fact, about everything in which the people of to-day are interested. This Exposition to be opened iu Decemher next, covers more ground, has more exhibits entered, than can be recorded of any other World's Fair ever attempted. Aside from the pecuniary means furnished the untiring industry of its directors, this marvel of the nineteenth century owes much of its renown to the power of the newspapers.

CUBIC FOOT OF ORE.—In the course of the trial of the Albion-Richmond mining case, there was a question of the weight of a cubic foot of ore. The *Sentinel* says: The first witness put on the stand for the Richmond side was L. W. Davis, the company's smelter and refiner, who, in company with Mr. Longley, Mr. McMillan and Mr. Humphreys, went dowu into the Richmond 300 level Sunday, and brought up for weighing a cubic foot of brown carbonate ore. By actual test on the scales it was found to weigh, within a pound, more or less, 135 pounds. There was a great deal of questioning as to how the cube was obtained, but the four witnesses agreed in their statement as to how it was done to get the measure accurately. They took dowu a sheet-iron hollow cube, open at two ends, and drove it into a five-foot breast of ore, and displaced its volume, as stated. The weight of the ore cube was found thus by the most practical method to be considerable less than the estimate made of similar ore by Col. E. N. Robinson. The idea of such a test is certainly original and ingenious. Col. Robinson's estimate was that it takes 10 cubic feet of ordinary Ruby Hill carbonate ore to make a ton of 2,000 pounds, or 200 pounds to the cubic foot. From other witnesses the evidence was obtained that the ore in Ore Body B would give an assay of $40 or $45 per ton, and also that the rock displaced in excavating this chamber was not all ore, but was mixed with an average of one-third waste.

CALIFORNIA SALT.—There are twenty-five salt works on the eastern shore of San Francisco hay, and the traveler by rail will see huge piles of salt all over the marshes at Alvarado and thereabouts. Shallow vats or ponds are formed, into which the water of the bay can flow at high tide. The warm sun, re-enforced hy the trade winds, soon evaporates a quantity of the water, which is then let into a number of successive ponds in which the same process is repeated until it is finally reduced to a brine. In the last pond, the floor of which is constructed out of boards, the salt crystallizes, and such portions of the brine as do not crystallize are manufactured into magnesia. San Diego and Los Angeles counties also have salt works operated upon the same principle. The only place where salt is made out of salt well water is in Siskiyou county. There is a well situated about six miles from Yreka and bored to a depth of 675 feet, throws up 10,600 gallons of salt water each hour. The well also discharges an uninterrupted flow of gas which burns with a bright yellow flame. The salt from this water is produced by allowing it to fall from a considerable height through brush arranged for that purpose.

THE Virginia (Nev.) *Chronicle* of July 26th says: Superintendent Boyle of the Alta mine has rigged up a queer apparatus for crushing quartz for prospecting purposes, and thinks he has found the germ of a practical working mill. It is merely an Ingersoll drill with a stamp attached, firmly set upright in a mortar. With a limited head of compressed air, the machine develops a wonderful appetite for quartz or anything else that may be fed to it, striking a blow equal to a 700-pound stamp, at the rate of several hundred clips a minute.

THE government is building the light-house on St. George reef, in Humboldt county, entirely out of granite quarried near Mad river. The deposit has been found to be very extensive, besides being located in a very favorable position.

THE Nevada City Mining Company are running their 20-stamp mill night and day and crushing from 40 to 50 tons of quartz every twenty-four hours. Each stamp weighs 850 pounds and drops 95 times a minute.

PRELIMINARY surveys are heing made to turn the Stanislaus river at a jutting point near Rolero's Ferry. By this means the bed of the river can be drained and minded for a long distance.

ENGINEERING NOTES.

Electrical Transmission from Niagara Falls.

At the annual convention of the American Society of Civil Engineers, Mr. Benjamin Rhodes read a paper, from which we condense as follows:

Dynamic electricity is used substantially only for the electric light, but this has become a great industry. It is the object of this paper to show what has been done and what may be done toward the utilization of Niagara for electrical purposes. The power of Niagara can be estimated very approximately. To utilize this amount of power by water wheels, generate electrical currents, and transmit to various cities within five hundred miles would necessitate a plant representing at least $5,000,000,000. Such figures as these give some idea of the enormous amount of power here in reserve.

A small proportion of the power of Niagara is already utilized for electrical purposes, and a much larger amount can be developed at moderate cost. Its use for this purpose has hitherto been limited to the local use of the electric light, but this use has been such as to give much valuable experience. A brush dynamo has been in use in Prospect Park for the illumination of the falls and grounds, since July 4, 1879. This machine is run under peculiarly favorable conditions, having always the same number of lamps in circuit, with power supplied by a water-wheel of proper capacity, and the plant operated only two hours of each day. The working has always been smooth.

A local brush company was formed in the fall of 1881, and has since been lighting the streets and dwellings of the village of Niagara Falls with from 40 to 60 lamps. The company has met with fair results in this enterprise.

The future application of Niagara's power to electrical purposes is an interesting subject. The local use will keep pace with the growth of the town, but will of course be comparatively small. In order profitably to transmit currents of electricity to a distance, several conditions must be observed: The cost of transmission must be less than the difference between the cost of steam and water power; the distant point must be one where the currents of electricity can be used, and where water-power can not be obtained.

There is no point so likely to fulfill these conditions as the city of Buffalo, and the project must be proved practical there before being attempted in larger and more distant cities. The cost of erection complete of a number of circuits of proper length would be about $4,000 per circuit, which would supply 100 lights. The size of the wire will be less for water-power than for steam.

Careful calculations show that the saving in the cost of the electric light by the use of water rather than steam would be $40,000 a year on 1,000 lights. Enough has been said and done to show that the power of Niagara can be transmitted to a distance of 25 miles with a great saving over steam, and that, with improvements in storage batteries and electro-motors, this distance can be increased with economy to from 100 to 150 miles. With further improvement in dynamos and insulating material, to permit the use of currents of higher intensity, the economical distance may be still further increased.

How Vessels May Pass Over Niagara Falls. An ingenious inventor has devised a plausible scheme to accomplish this end. In the longitudinal center of an inclined trough of sufficient length and size for the race or passage-way are cells, while in the sides are a series of triangular cavities. The water falls in succession into each cell as it passes down the way and forced from beneath into the triangular cavities and to the surface again. These cavities face the top of the way, and as the water rushes through them it goes upward, forming an upper current. The effects of the way is that a waterfall, or strongly flowing current, can be forced to run up hill instead of down. Thus will be afforded practically a stream running counter to the course of the falls. The inventor reckons that the inclined trough would have to be about 2,000 feet long, with a fall of one foot in forty. The current could be forced up the way with sufficient velocity to carry a tow of vessels to the top without any assistance from either steam or sails.

The Oldest Steam Engine, Perhaps.—From a recent item in the English papers we notice that an English firm, Geo. Atkinson & Co., of London, are about to remove from their premises an old beam engine, which has been continuously at work on the spot where it now stands 90 years. It is a Boulton & Watts engine, sun-and-planet motion, and both its beam and connecting-rod are of wood. This relic of former days should be carefully preserved in some museum.

Railroads in India.—Ten thousand eight hundred and thirty-two miles of railroad in British India are now open for traffic, and Mr. Juland Danvers states that the forthcoming annual report will show that the capital expenditure amounted to $713,034,500, including lines under construction; that the average cost per mile came to $56,500, and that the net receipts from all the lines were $42,094,500 for the year.

USEFUL INFORMATION.

Nickel in Kitchen Utensils. It is well known that acids have a more or less decided solvent action on nickel, and on nickel-plating; and inasmuch as the use of nickel-plated kitchen utensils (in Germany) is becoming quite general, it is a matter of serious moment to determine what would be the effect on the human organism of the nickel which may find its way into the food prepared in such vessels. An investigation, having this purpose in view, has recently been made by F. Geerkens, who affirms that as much as ½ gramme (about 7½ grains) of nickel may be taken into the stomach, and repeated for a long time, without producing any noticeably bad effects. When, now, it is considered that the quantity of nickel, which, by any probable means, could find its way into food in the course of its preparation in nickeled vessels, would be only a very fractional part of this quantity, there would seem to be no grounds for uneasiness in the use of nickeled kitchen utensils, especially where the same precautions are used as in the case of copper utensils -namely, thoroughly cleansing them and avoiding the storing of food in them. *Manufacturer and Builder.*

To Make Kofmiss.—Invalids for whom kofmiss is prescribed will hardly care to pay extravagant prices for it at the drug store when they learn that it can be made for fifteen cents a quart with very little trouble. Fill a quart bottle to the shoulder with good milk; then dissolve two tablespoonfuls of white sugar in a little water at high heat; add to it the milk and drop a quarter of a two-cent cake of yeast the latter must be fresh—into the mixture. What remains to be done is merely to stopper the bottle securely; shake the contents well together; leave the mixture to ferment for six hours at any temperature from 60 to 95 degrees F.; cool it in the ice-box over night, and drink it at leisure.

Mummy—What is It?—There is a pigment which paint manufacturers prepare for artists, called "Mummy." It is said to come from the catacombs, and is an asphaltum, which has become incorporated with the remains, and makes a rich transparent brown, which is used by artists in glazing and toning down effects. A manufacturer, who always had some doubt as to this pigment being what its name indicated, says, he was recently convinced, when a workman brought him a perfect section of a human vertebræ, which he preserved as an "antique" of some old fellow who "walked in Thebe's streets 3,000 years ago."

In preparing terra-cotta lumber, Gillman mixes one part pure clay, with one to three parts sawdust, and the requisite amount of water, and presses the mass into large blocks, which are dried and then burned for two days. The blocks are then cut into the desired shape with circular saws. Terra cotta lumber is incombustible. It resists acids and the influence of the atmosphere. It is a bad conductor of sound, heat and electricity. It is only half the weight of the same bulk of bricks, and it can easily be sawn, planed or carved. Finally, when put into a building, it combines intimately with lime, gypsum, etc.

A Substitute for the Bit.—An invention has recently been patented, which, it is thought, may eventually abolish that barbarous part of a horse's bridle known as a "bit." It is called the carrago, or anti-horse torture. It is composed of a steel band placed over the front bone of the horse's nose, and to this appliance the reins are attached. The inventor claims for this substitute for the bit that it gives complete control to the driver over the horse without inflicting the least discomfort or torture on the animal itself. It is said to have been tried with satisfactory results.

A mineral white, suitable for use as a pigment, may be prepared, according to Cobley, by converting the first magnesium sulphate into the chloride by the addition of calcium chloride. To this 10 per cent. of aluminium chloride is then added, and from the mixed chlorides a white precipitate of the hydrated oxides is thrown down by the addition of milk of lime. A cheaper white is obtained by the direct precipitation of the corresponding sulphates with milk of lime. These pigments do not discolor by the action of sulphurous gases, like lead pigment.

The Mechanics' Fair.—The opening exercises of the Mechanics' Fair will be held at the Grand Opera House at 2 P. M. next Tuesday. Prayer will be offered by Rev. M. M. Gibson, and the opening address will be made by President Cornwall. After a song by the Amphion Quartette, Frank M. Pixley will deliver the oration. A visit to the fair building on Tuesday showed that very few things were in place; but workmen were busy and doubtless matters will be in the usual state of forwardness by Tuesday next.

The Wear of Coins.—More than £11,000 worth of silver, remarks an English contemporary, is wasted every year in the course of the circulation of the crowns, half-crowns, florins, shillings and sixpences. One hundred sovereigns of the date of 1820, which were weighed in 1859 by Mr. Miller, showed a loss in weight through circulation, which was estimated at £1 6 7. There is more waste produced in the circulation of gold and silver coins than is generally thought of.

To Make Fly Paper.—Take of rosin, in clean pieces, four ounces: castor oil, two ounces. Melt together by means of a water bath, and spread on sized paper. If it should be an advantage to have something sweet, it is probable that glucose, thickened by an additiou of dextrin or gum, would be very attractive to the flies. But as this mixture would be liable to soak through paper in very hot weather, it would probably be safest to spread it on paraffined paper. *—Druggist.*

Another New Use for Glass.—The *Popular Science Monthly* records the interesting fact that an Italian ship has been sheathed with glass plates, cast like iron plates, so as to fit to the hull, to take the place of copper sheathings. The joints of the plates are made water-tight by the use of water-proof mastic. The advantages claimed for glass over copper, are its insensibility to oxidation and its exemption from incrustation. The suggestion strikes us very favorably, and we shall look for the result of the experiment with interest.

Peculiarities of Nitro Glycerine.—Writing of the peculiarities of nitro-glycerine as an explosive, a puzzled engineer asks an explanation of the fact that only small fragments—sometimes a hand, a foot, or merely a finger or toe—of persons killed by explosions of that compound are ever discovered. These fragments are often intact and uninjured, while the rest of the body has disappeared as completely as though it had been converted into vapor.

To Prevent Cinder.—A compound to prevent the fusion of cinder has been patented by Mr. Wesley Case, of Topeka, Kansas. It consists of bicarbonate of ammonia, saltpeter, bicarbonate of soda, resin and other ingredients, mixed and used after a designated manner, to prevent the formation of clinker in the combustion of coal.

Smalley writes that there is some variety of opinion as to the right pronunciation of "Pepys." It is commonly pronounced in London as if written "Peps," though in the lifetime of the diarist it was pronounced "Peeps."

Oil stains may be completely removed from tiles by the application of twenty-four hours of a thick paste of fullers' earth and water, the application being repeated if necessary.

Orange Peel is now said to be collected, dried in ovens, and sold for kindling fires. It burns readily and with great fierceness, and is safer than kerosene.

GOOD HEALTH.

Poisonous Sleep Producers.

The idea is gaining ground, and the *London Lancet* favors it, that it is just as sensible to knock a man down who needs rest, as to give him narcotics because he needs sleep. Sleeplessness, says the *Lancet*, is always wakefulness in one or more of its multitudinous forms, and the recourse to narcotic poisons for its relief is utterly unscientific and deplorable. It is as clumsy in theory—in so far as it can be said to have a theory—as knocking a man down because he needs rest. What is it that prevents the natural and physiological rest of the body at rythmical periods? The brain is as truly a part of the body as the stomach, and it is as much a fault of the organs of the mind to prevent sleep by mental worry or wakefulness, as it is a fault of the stomach to render sleep impossible by bad digestion. No intelligent practitioner dreams of narcotizing the nerves of the gastric organ to promote sleep. Why, in the name of common sense, continues the *Lancet*, should any medical man for an instant think it legitimate to narcotize the brain because *it* exhibits some disturbing irregularity in its functions?

Sleep is not a special prerogative of the brain. Every organ sleeps, and general sleep is the aggregate of many sleeps. It is time to protest against this clumsy procedure. If we do so warmly, it is because we feel that the mistake is of common making. It is so much easier to write a prescription or make up a bottle of medicine or a box of pills with one of the rank poisons that mimic sleep, and as they do so deprave cerebral and nerve tissue, than it would be to search out the real and active cause of wakefulness.

There are more than a score and a half of *known* causes or forms of sleeplessness, each one requiring direct and specific treatment, and yet, as by common consent, the profession sanctions the abuse of such drugs as chloral and bromide as "poisoned sleep" producers. No medical man is justified in undertaking the treatment of his maladies. It is impossible that he should so far step out of himself as to be able to form a reasonable judgment of his case *objectively*; and no practitioner has the justification of science for the recourse to narcotics as remedies for sleeplessness, except when an exceptional pain is the accidental disturber of a sleep function, or a habit of wakefulness may be broken by an occasional dose of the stupefier.

Contributions to the Germ Theory of Disease.—The researches of scientific men are slowly but surely increasing the sum of our knowledge of the nature of infectious diseases, and furnishing us with more effectual weapons with which to combat them. One of the latest contributions to this important theme is that made by Prof. Tyndall, in which he offers a plausible explanation to account for the hitherto unaccountable fact that a single attack of a number of the most fatal diseases of this class usually affords the survivor complete immunity from a second one. Prof. Tyndall suggests that, just as the soil may be so effectually robbed of some essential ingredient by one abundant crop as to be incapable of producing another, so in the human system a parasitic disease may so completely exhaust the blood of some ingredient necessary to the growth and propagation of the parasite, that the production of a second crop in such quantity as to be fatal may be rendered impossible. Thus it may be possible that only once in the lifetime of an individual his system may present the conditions suitable for the development of small-pox, typhoid, scarlatina, etc.; and having successfully passed through the ordeal, the body may have been so impoverished, or deprived of some essential ingredient by the first crop of parasites, that it becomes invulnerable to a second attack. This view certainly has great plausibility, and has lately been to a certain extent rendered more probable by certain researches of other experiments in the field of experimental physiology.

The Hygienic Effect of Patents.—In many of the later articles on the advantages attributable to our patent system we have seen tabulated statements to show saving in money and saving in time, but we have no recollection that any statistics have been offered to prove that we nwe more in health, and even in longevity, to patents than to any one cause. We want to see tabulated statements of the number of lives saved by the kitchen appliances which lessen toil and drudgery, or by the household articles which make domestic work rather a pleasure than a toil, or by the labor-saving appliances in the factory, the workshops or on the vessels. These devices each and all lessen toil; harness a motor into service for the brute work, and have the human being merely to guide and direct—to do the thinking, as it were. Consider how much more work can now be done per capita, and the minimum of physical labor required for it. In the mere item of traveling by land or by sea, what a gain in all that lessens the strain on the system? One now can almost go from New York to San Francisco in about the same time and with far less weariness or effort than was required fifty years ago to toil and moil over the long and dusty or dreary and muddy roads from New York to Washington. This general statement of physical and material gain is indeed true in all the departments of life work. Some scientists say that in less than the last fifty years we have added a half generation to the life span. We doubt if the true reason for this can be found in any other source than in the one we have above intimated.—*Ex.*

Length of Our Lives Increasing.—At a recent international health exhibition held in London, Sir James Paget delivered an address before the association, the Prince of Wales being present. The learned physician asserted that people live longer than formerly, and that less sickness prevails among the mass of people, and he then gives the following reasons for the decrease of mortality during the last few years: "There is less from intemperance, less from immorality; we have better, cheaper and more various food, far more and cheaper clothing, far more and healthier recreations. We have, on the whole, better houses and better drains, better water and air, and better ways of using them. The care and skill with which the sick are treated in hospitals, infirmaries, and even in private houses, are far greater than they were; the improvement and extension of nursing are more than can be described; the care which the rich bestow on the poor, when they visit them in their own homes, is every day saving health and life; and even more effectual than any of these is the work done by the medical officers of health and all the sanitary authorities now active and influential in every part of the kingdom. But we want," adds the lecturer in closing, "more ambition for health—a personal ambition for renown in health as keen as is that for bravery or for beauty, or for success in our athletic games and field sports."

A New Explanation of Mental and Nervous Disorders.—Dr. B. W. Richardson has offered a new and plausible explanation for the occurrence of various forms of mental and nervous disorders, namely: That they depend for their development on the presence in the body of certain organic compounds, formed by certain unnatural or abnormal chemical processes carried on within the body itself. He has proved that the substance amylene—an organic product that is sometimes formed in the body—produces phenomena identical with somnambulism. He believes, from his researches upon the action of lactic acid, that the presence of this substance in the body will account for certain forms of heart disease and rheumatism. Similarly he advances other suggestions as to the probable effect of other chemical compounds of poisonous nature which he believes may be developed in the body by abnormal processes, and discusses their possible relation to the causation of special forms of disease.

MINING SUMMARY.

The following is mostly condensed from journals published in the interior, in proximity to the mines mentioned

CALIFORNIA.

Amador.

CLEAN UP.—Amador *Ledger*, August 1: Another clean up was made last week at the Lighthouse mine, near Butte City, owned by W. E. Stewart and Herman Tripp, which yielded at the rate of $6 per ton. This amount leaves a good margin of profit, as the ore is worked at very little cost. Four men are employed at the mine and two at the mill, and five stamps are kept steadily at work. The big tunnel at Middle Bar is now in a distance of nearly 1300 ft. The formation through which it is at present passing is comparatively soft, and rapid progress is being made. The ledge has not been cut yet, and it is likely that another 100 ft or more will have to be run before a junction is made. The last clean up at the Iowa at Sutter creek, was richer, we are informed, than any previous run. The South Spring Hill has been much troubled of late on account of frequent breakage of hoisting machinery. The engine is not of sufficient power for the work it has to do. The mill, however, is kept pretty steadily at work.

SUTTER CREEK.—The mining outlook remains about the same, considerably mixed, and the question agitating the public mind is whether we are to be struck by lightning or have a spell of prosperity. Many think the one is just as likely to happen as the other. The men that were put to work in the 200 foot level of the Mahoney have all been laid off, on account of the ore being of too poor quality to pay. Twenty stamps of the mill were kept running four or five days, but were hung up as soon as it was evident that it would not pay. The contractors are making fair headway with sinking, and have already completed about one-half of their job. Mr. Stewart has a crew at work on the Lincoln ground. Everything about the Eureka is quiet. Only a few men are retained, who are employed in running a crosscut. The mill is idle, the pay rock being exhausted. I have it on good authority, however, that it is the intention of the company to commence sinking at once. The Voorheis sulphuret works will close down soon to undergo considerable repairs. New ovens are to be built, a large portion of the brick for which has already been secured. The works will remain idle for about two months.

Calaveras.

SILVER.—Cor. Calaveras *Citizen*, Aug. 2: Considerable excitement has prevailed at Sheep Ranch of late owing to the discovery of a rich silver lode, by John Swank, near Blue Mountain, on the south side of the South Fork of the Mokelumne river. For years past it has been the belief of mining men that Blue Mountain is a massive body of mineral although the baser metals it was considered predominated so extensively that the more precious treasure could not be found in rich enough strata to warrant working. However during the digging of Clark's ditch, near its head in the Mokelumne, the laborers found a bolder which when broken attracted attention and specimens of the ore were sent below for assaying, resulting in the report that the ore was rich—some say fabulously—running up to figures in the hundreds per ton. Subsequently parties interested in the discovery of the float, held a meeting, organized a company, and begun the work of running a prospect tunnel. Recently John Swank, learning the past history of the place, saw fit through the advice of his father, to do some prospecting in that section. He had worked but a few days when he made the lucky find of the rich vein above described, the rock from which is said by experts to be quite rich in silver. The lode was found by him a very short distance from where the operating parties years ago ceased their labors in the tunnel.

Inyo.

POLITA MINE.—William Irwin and Tom Luther, formerly of Bodie, have purchased a three-fifth interest in the famous Polita Mine opposite Bishop creek, and have also rented the Hawley mill, where they will crush several hundred tons of ore and ascertain the best method of reducing the same. They will then probably put up a mill near the mine. The C. & C. R. R. Co. are now putting in a side track at a convenient point for the transportation of the ore, and will also probably build a side track to the Hawley mill. Messrs. Irwin and Luther are shortly to be joined by Mr. Geo. Storey, and we have no doubt but this trio will make a success of it.

MAXIM MINE—Last Tuesday Mr. Nevins brought in from the Maxim mill seventy-seven ounces of gold bullion, worth fourteen hundred dollars. This bullion was obtained from seventy tons of quartz. The quartz contains a large per cent of sulphurets, and as there is no concentrator at the mill the loss must have been heavy. From the result of this run it is very evident that with concentrators and vigorous working of the mine, the Maxim would develop into a very valuable property.

DEFIANCE FURNACE.—At the Defiance furnace six tons of bullion are being turned out daily, being a yield of twenty per cent from the ore smelted. The bullion is all high grade. The mine and furnace are the property of Hon. P. Ruddy, who is a firm believer in the great value of the mines of the district, and is confident that immense profits will be made by working them.

MODOCK FURNACE.—The Modock mine and furnace at Lookout is turning out bullion steadily. There is now a large quantity of bullion at the railroad ready for transportation to San Francisco. Mr. Frank Fitzgerald, the owner of the property, is making a good run at the furnace. Messrs. Alexander and Kehoe will shortly make a shipment of ore from the Eclipse to Etna furnace, which will soon start up. Yesterday morning four miners left Lone Pine for the Beveridge district to work for Cohn & Straus. Three miners have gone to Kreggs' canyon to work the mine there and start the mill. At the old San Carlos mine a force of men will be put to work next Monday.

Placer.

RICH GRAVEL.—Placer *Herald*, August 2: A correspondent, writing from Pino, says, that about three years ago, George Lee sunk a shaft in his ground about three miles south of that place, and at 54 feet he struck a bed of river gravel about four feet deep, which proved to be gold bearing, and which averaged from eight to ten cents per pan. A year later he commenced a tunnel in the hill, and about 250 ft from the entrance the gravel came in overhead and gradually, but unevenly fell, until near the shaft, when he found the gravel from three to seven ft deep, and resting on the sandy or pebble stratum which underlies the old river bed. He washed out 260 cubic yards, from which he realized $2,600. The bed seems to be extensive, averaging about four ft deep and 60 ft wide. Mr. Lee, says the correspondent, has recently commenced work again, and his prospects are favorable for another big clean-up.

THE GOLD BLOSSOM.—Some weeks ago, in referring to a decision of the Secretary of the Interior, affecting the title of the Gold Blossom quartz mine in this county, we inferred that the case involved the whole of that company's property. It appears, on information from the party in charge, that the ground in dispute was a piece independent of the main property, and that the decision will not materially affect the company, since they retain all the ground on which work has been done, and on which their mill, hoisting works, etc., are located.

Plumas.

GREEN MOUNTAIN.—Greenville *Bulletin*, July 30: At this mine work is progressing and everything is running smoothly. The air drills which had been stopped on the 17th inst. in order that the air compressor might be repaired, were started Tuesday in the face of No. 2 blind drift. This drift will now be pushed to the east line of the chimney without delay. No. 3 blind drift goes steadily along, and fair progress is made, though the rock is exceedingly hard. No. 2 raise is now forty ft above No. 3 blind drift, and is in hard quartz. As soon as the raise connects with the winze from No. 5 level, the mine will be in good shape for easy handling of the ore of this chimney. The mill is running well at its full capacity.

FOREST KING.—The owners of this mine have leased the Arcadian mill for one month in order that they may test the ore. Though the mill has been running but a few days on the rock of this mine, the indications are that the ore is paying well. About twenty tons per day are being hauled from the mine. The quartz in the tunnel prospects better than the croppings. The vein is quite strong. A width of from four to eight ft is being removed.

San Bernardino.

PROVIDENCE NOTES.—Calico *Print*, August 2: The Bonanza King mine still maintains its reputation as being the richest silver mine in the State. It shows no signs of exhaustion, and rich pockets and veins are constantly being opened. The work is progressing smoothly and in a systematic manner. Under the able management of the general superintendent, Mr. Thomas Ewing, and his skillful subordinates, the mine and mill accomplish the highest possible results from the facilities at their command. The mine is yielding about $60,000 in bullion, each month, and has reached a depth of 550 feet, and work is progressing from the seventh level. Eighty men are employed in the mine and twenty in the mill. Perry Kerr's claim, situated about a mile north of Bonanza King, is still working a few men, and is improving in appearance. The shaft is down 80 feet with crosscut of 15 feet showing ore its entire length. The owners of this fine prospect lately refused $40,000 bond with a forfeit of $2,000. It is rumored that the last expert who examined the property will advise the purchase of the mine at $75,000, the owner's price. The original discoverers of this flourishing camp, Dwyre and Gorman, are still prospecting the Belle McGilroy mine south of the Bonanza King. They lately struck some good ore on the contact in good working ground. Their shaft is down about 30 feet and gives promise of a large deposit of carbonate ore carrying about 150 to 200 ounces in silver. Still further south the group of claims called the Lucknow, Mozart and Mineral Point, are also being prospected by the owners, Barrett, Cook and Thompson. Our reporter was shown some of the rock, specimens of a fair grade. There are about 250 people in the camp.

Sierra.

FOREST CITY.—Cor. Sierra *Tribune*, August 1: The mines, of course, are first in importance, for they support the other lines of business. Soon after the fire some seventeen months ago the South Fork Mining Company made arrangements with the Bald Mountain Extension Company allowing them to work a small portion of the South Fork ground. During the winter this furnished employment for about seventy men. It now employs thirty-five or forty men. It has well repaid both companies for the labor performed, and up to May 1st a little over $100,000 had been taken out. After deducting expenses quite a handsome dividend remained for the lucky shareholders. In the main tunnel bed-rock has been found, and everything looks encouraging for the other mines on that ridge. Of the Bald Mountain it is unnecessary to speak, for it is already widely known. They have, however, arranged to work a part of the South Fork ground, and it is the earnest wish of all that it may yield the coveted ore as abundantly as the part worked by the Extension Co. The South Fork location is a valuable piece of mining ground, and capital is the only thing needed to prove it so. It was prospected several years ago, when a lower channel was discovered which is entirely independent of that being worked by the Extension and Bald Mountain Companies. In the North Fork dump several of our citizens are prospecting for a new metal, the name of which I dare not try to spell.

Siskiyou.

PICK AND PAN.—Yreka *Journal*, July 31: Daggett & Lasource, at Buckeye Bar, are on bedrock with derrick, and are realizing good pay. A $14 nugget was found in their claim last week, which is an extraordinarily heavy piece for river mines. Jacobson & Crary will have their wingdam completed next week, by which time everything will be in complete working order. In the well-equipped claim of Cole & Mott, on Klamath river, the work of pumping out has commenced. They have also commenced sinking to bedrock. Leduc, Barton & Co., four miles below Oak Bar, have completed their wheel and are sinking for bedrock. They will realize pay this week. The Klamath Quartz Mine in the Salmon district has, in the past four months, paid $2,000 over and above expenses, and its prospects are brightening. The credit of the rapid development of this mine from an expensive experiment to a paying property is, to a great extent, due to the efficient management of Superintendent J. B. Tonkin. The mill is at present idle, owing to the failure of water, but will be started and run by steam in about six weeks.

HANKINVILLE.—Cor. Yreka *Union*, July 31: The water through the big ditch has at last reached us, and is used by several companies who are engaged in ground sluicing. Several breaks occurred in the ditch last Thursday, caused by the storm. Mr. Joseph Marie is busily engaged in cleaning and washing bedrock which he had ground-sluiced some three years ago, but was unable to clean up at that time on account of failure of water in the big ditch. We have noticed several new comers here who are engaged in prospecting for quartz or placer claims, and who, like ourselves, believes there are good mines yet to be discovered in this vicinity. John Miller & Co. are busily engaged rigging up their claim and making big preparations for ground sluicing.

Trinity.

CLEARED UP.—Trinity *Journal*, August 2: Miners in and about Weaverville have nearly all finished cleaning up, and, while they do not report figures, we understand that most of claims have paid better than last year.

LOOKING SPLENDIDLY.—Mr. T. C. Cox, of the firm Cox, Gibson & Co., owners of the Enterprise mine in Deadwood District, was in town this week and informs us that on Tuesday last they broke through the shaft connecting with the end of the tunnel in the mine, and were now happy in the possession of plenty of good air. The perpendicular raise is 142 feet, and in addition to giving them the much-needed fresh air, the shaft demonstrates the richness and extent of the lode. Mr. Cox had with him a splendid specimen of ore taken from the face of the tunnel the day before he came in, and informs us that there is plenty more of the same sort in the mine.

EAST FORK QUARTZ.—Mr. James Moor was in from East Fork this week, and from him we learn that the mine of Day, Moore & Co., is holding out well and paying as heretofore, the average of rock crushed thus far going over $100 to the ton. Parties of experience, recently in that section, and who have concluded to locate there, are reported as having given their opinion that formation and general indications in the East Fork District are the best on the Coast, and we shall expect to soon be called upon to chronicle more rich discoveries in that section.

WEAVER BASIN VS. COEUR D'ALENE.—Last week we mentioned the visit of Mr. Chas. H. Watt, of Placerville, to Trinity county, for the purpose of inspecting our mines and prospects generally, with a view to investment and possible location. He is an old practical miner, and has only recently returned from the Coeur d'Alene mining section. In private conversation, regarding the two sections, he said: "Weaver Basin has four times the mining ground that Coeur d'Alene has, and from what I have seen of both am of the opinion that Weaver will pay four dollars where the other will not pay four bits!"

NEVADA.

Washoe District.

ALTA.—Virginia *Enterprise*, August 2: After the diamond drill had been sent in to the eastward on the 2150 level to a distance of 92 ft the hard rib of black dyke was passed through and the west side of the ore vein reached. When the edge of the vein was cut a strong flow of water was tapped. The water was forced out through the stem of the drill so strongly that no samples could be obtained—all the drillings being blown about in jets of spray. The water is now being allowed to drain out. The west drift on the 2150 level is being pushed forward at the rate of about 50 ft per week, and in a few days will reach the belt of fertile ground passed through by the diamond drill.

SIERRA NEVADA.—The joint Ophir, Union Consolidated and Mexican winze below the 3200 level of the latter mine is showing improvement at the bottom. The bastard quartz is giving place to the genuine article, intermingled with bunches of porphyry. The winze is now down about 58 ft below the 3200 level. On the 3100 level work in the crosscuts is not being steadily prosecuted. Men are being shifted to that point from other places to keep them employed.

MEXICAN.—The winze on the 3200 level, which is being sunk jointly with the Ophir, Sierra Nevada and Union Consolidated Companies, is now making fair progress. It was yesterday down about 58 ft. Genuine quartz is now taking the place of the bastard variety which has for so long made blasting a difficult operation. Detached bunches of porphyry are still met with.

OPHIR.—The west drift on the 500 level is now being rushed along at the rate of 60 ft per week. On the 250 level of the old works some paying ore is still being obtained from the fillings of the old drifts.

HALE AND NORCROSS.—The diamond drill having been run in various directions on the 2800 level to feel for water, and all being considered safe, regular work at drifting was resumed yesterday morning. From the ore body on the 200 level they continue to ship about 400 tons a week to mills on the Carson river. Last Monday there was sent to the Carson mint 4,300 ounces of crude bullion, being an additional return of bullion from the Eureka mill on last month's account.

GOULD AND CURRY.—The joint Best and Belcher west drift on the 2500 level is now being advanced at the rate of about 60 ft per week. Some promising quartz streaks have been cut through and the porphyry is becoming softer.

BEST AND BELCHER.—On the 2500 level the joint Gould and Curry west drift is making about 60 ft per week. It is now in softer ground than heretofore, and is showing some quartz of promising appearance.

CHOLLAR.—The main south drift on the 2800 level has been pushed forward at the rate of over 60 ft per week. They have now reached the point where crosscutting will commence.

YELLOW JACKET.—A good deal of low-grade ore is still being extracted and sent to the mills. While the ore already opened up is being extracted a considerable amount of work is doing in the way of running exploring drifts.

UTAH.—The southeast drift on the 1950 level is being advanced at the rate of about 30 ft a week. It is passing through vein porphyry, with seams of clay and occasional feeders of quartz.

CROWN POINT.—About the usual quantity and quality of ore is being mined and sent to the mills. A considerable amount of ore is being opened up by the prospecting drifts.

ANDES.—The winze is fast nearing the vein, where it is expected some paying ore will be found. The north drift is in quartz showing occasional bunches of low-grade ore.

CONSOLIDATED VIRGINIA.—The diamond drill is still being run on the 2900 level. The ground is found to be wet and the water is becoming very hot.

Bald Mountain District.

SLUICING FOR GOLD.—Eureka *Sentinel*, August 1: John Adams, Smith Fuller and several other miners have taken advantage of the unusual snowfall, and consequent large supply of water in Bald Mountain, to sluice for gold. They have to work at considerable disadvantage, but for the last month or so they have got out an average to the man daily of about $3. They get a color any place along the ravine, and in some places find little nuggets running from 50 cents to $1.50 in value. The gold is coarse and harder as they go down, and they are now working for bedrock, where, perhaps, they may make a good clean-up. Since starting into work they have found gold for a distance of some 400 or 500 yards in the gulch, and above where they had supposed the cross-ledge to be, from which the supply of gold originates. The Judge and Mr. Fuller thinks that they have a bright prospect for finding the mother lode, and they believe that when they do, Bald Mountain will be the scene of the next grand rush and excitement. They were surprised, after digging down some seven or eight feet through the loose dirt and gravel, to find, along quite an extent of the ravine, here and there, small quantities of native quicksilver resting in crevices on the compact gravel. There has been some sluicing in the ravine before, and quicksilver has probably been used, but not where it is now found. It is evident from the circumstances that the metal is deposited, in the state discovered, by some natural process. As everybody knows, quicksilver is ordinarily found in the form of cinnabar, from which it is extracted for use. It does not always occur in the form of ore, however, and is sometimes, though rarely, found in a pure state. The books tell us that when it is so found, it is in proximity to mercurial ores, from which it has been eliminated by chemical process in nature's own laboratory, as bluestone is found crystallized near by deposits of copper ore. Hence, possibly, the gentlemen sluicing for gold on Bald Mountain may be working in the neighborhood of a deposit of cinnabar. If so, they have a better thing than even gold to prospect for.

Columbus District.

MOUNT DIABLO.—*True Fissure*, August 2: The north crosscut from winze No. 5 has been stopped after reaching a length of 34 feet, and a west drift has been started on the ore body cut by the same. The west drift on the third level has been stopped, and a south crosscut started from the same is now in 15 feet, and shows a strong ledge of low grade. A north crosscut, from the east drift on the third level, some 75 feet east of the shaft, is now being extended. The west intermediate, between the second and third levels, is in 126 feet, and shows but little of value. A small amount of ore is being taken from the west drift in a winze on the first level, and there is a small streak of ore near this place. The west drift on the fourth level has been driven 13 feet during the week, and shows a little ore in the face.

Garfield District.

MILL.—Bodie *Free Press*, July 28: The mill being put up by Farrington, near Garfield, will be in running order about the first of next month, and he will start in working rock that will go in the neighborhood of $500 a ton. Farrington has his three mines—the Western, Allington and Bell—now running. A five-foot ledge has been developed on the Bell and the rock is very rich. Mr. Moss has discovered a very good prospect which he is now working nine men on. The rock contains only gold, is free milling and very rich. A shaft has been sunk 200 ft and the ledge cut two or three times. As soon as a good mill site can be found Mr. Moss will put up a ten-stamp mill. Work is going on in the Hindley mine, owned by some Dayton parties, and the prospects are good. Two men are working and have a tunnel in 600 ft. A ledge was struck at 450 ft that carries ore assaying $200. The vein is a small one. Archie Farrington will put about fifty men to work in his mines in a short time.

Gold Run District.

COMMENCED OPERATIONS.—*Silver State*, July 29: The Great Republic Company, a San Francisco corporation, has commenced operations on their mines in Gold Run District, twelve miles from Golconda. They have two leads, one of which is thirty or forty feet wide, and both carry considerable ore of a low grade. It is the intention of the company, if the developments warrant it, to build furnaces for reducing the ore at Golconda.

Star District.

A VALUABLE MINE.—*Silver State*, July 28: J. H. MacMillan, who has just returned from a visit to Star District, informs us that the prospects in the new mines of that old camp are good. There are seven men at work on the Grizzly taking out ore, the first quality of which nets $1,000 per ton in San Francisco, and the second-class, from $250 to $400 per ton. The owners have employed Alex. Wise to haul fifty tons of the ore from the mine to the railroad at Mill City. A carload of the first-class ore will be shipped to San Francisco this week, and the remainder will be worked at Mill City, the mill at which place is expected to start up about Wednesday.

ARIZONA.

RIVERSIDE AND MINERAL CREEK NOTES.—*Silver Belt*, August 3: Mr. Charles E. Taylor, who returned on Tuesday from Riverside and Mineral Creek, reports matters, particularly mining, in that district as exceptionally brisk. He noted a number of improvements at Riverside. The 30-ton water jacket furnace is being repaired and will soon be ready for use. At the Ray mine on Mineral Creek, six miles from Riverside, there is unusual activity, and a town is rapidly springing up. The Ray Copper Co. have in process of erection concentrating works which will have a capacity of 75 tons. They

are completed with the exception of the roof, the iron for which has not yet arrived. They expect to have everything in readiness to start up on the first of next month. Nothing is being done in the Ray mine at present nor will there be until the reduction works are completed. There is a large quantity of ore on the dump. Work is being energetically pushed on the Poorman mine, belonging to the same company, and it improves as the development progresses. The Old Dominion Co. has a very promising property known as the "Mineral Creek," but it is not being developed at present. One of the richest claims in the district is the Monarch, owned by D. H. Snyder and Dr. T. C. Stallo. Considerable work has been done on it and the mine is developing finely. Miners who have worked in the Ray say they would rather own the Monarch than the Ray. Mr. Snyder will continue work on his claim. The Mineral Creek district is undoubtedly one of the richest copper districts in the territory. There appears to be a belt of mineral two to three miles wide, running from Mineral creek in a southeasterly direction, crossing the Florence road at Cane springs, and extending to Tweed's camp on the Gila. The success of the Ray Company will make this district one of the most prosperous in the territory.

COLORADO.

NOTES.—Georgetown *Courier*, August 2: Two more Rouse tables have been added to the Cory mill. Some good ore is coming out of a few lodes on Irwin's Peak. A run from the Bright Lode in Daily district, gave 328 ounces silver to the ton. The last mill run from the Kongsburg Lode, on Democrat Mt., gave 650 and 375 ounces silver to the ton, according to class. Every lessee on the Baltimore mine is reported to be doing well. Bryant & Co. are steadily shipping high grade ore. Peterson & Co. recently encountered fine mineral which promises to pay them well. Work at extending the adit on the Montreal, Brown Mt., is steadily progressing. The adit is now in 440 feet, and approaching the point beneath the rich ore pocket discovered a number of years ago. The property is located in a hot-bed of rich mines, and will undoubtedly prove very valuable. It is owned by the Montreal G. and S. M. The contract to extend the drift on the Corry City vein No. 3, Diamond Tunnel level, has just been completed. This drift is now in 125 feet, and in it has been found the first rich mineral discovered in the tunnel workings. The tunnel company is now considering the letting of a contract to extend this drift to a point under the Corry City discovery from which they will commence raising.

UTE CREEK.—Gow Bros. have a very flattering prospect. Although the developments are very meagre, there is enough to show an experienced miner that it is a good piece of property. Carbonate of copper, black and gray sulphurets and native silver runs from Grassroots, and as depth is gained the mineral improves in quantity. The Andes, Argosie, Alexander and Livingston are all good looking prospects, and all showing more or less mineral. We understand, Dr. Hoop, of Idaho Springs has bought the Humboldt property. He has six men at work, and as ground is opened up, the force will be increased. This is the best developed mine in the camp, and more money has been taken out than any other. It is one mine that has paid its way, and there is enough money in the dump to do as much as has been done.

DAKOTA.

THE TIN MINES.—*Pioneer Press*, July 28: The discovery of tin ore marks a new and important epoch, not only in the history of the Black Hills, but in the history of metal mining in the United States; for, although small finds of stream tin have occasionally been reported in America, nothing in paying quantities, and in no instance tin ore—cassiterite—has been heretofore discovered. The Black Hills have both; there can be no question of it. The doubting period has passed; the existence of a tin belt sixty miles long has been unquestionably established. They find it at Sand creek, on the north, and at Harney's peak, on the south; at Rockford, midway between those points, and unmistakable evidences everywhere. True, no vast amount of work has been done, so secret is the discovery, but developments are sufficient to convince the most skeptical of all that I allege—like Mercutio's wound, it is enough. The most prominent metallurgists of America, such as Professor Riotte, of New York; Professor Bailey, of Cheyenne; Professor Phelps, of London; Professor Hulst, of Milwaukee, and others, have given the district the most critical examination, and have pronounced in its favor. The ore assays from five to seventy-five per cent. The famous mines of Cornwall do not average over three per cent. You can, therefore, draw your own conclusion as to the value of the Black Hills tin mines. The Etta was recently sold to a New York company for $21,000, and is being rapidly developed.

IDAHO.

VIENNA.—Wood River *Times*, July 30: Mike Rose is down from Vienna, to see what arrangements can be made for shipping his ore. He says that he has from 18 to 24 inches of ruby silver ore in the Silver Circle, from which he is extracting about a ton per day. He reports Vienna quiet, but prosperous. A new strike was made in the Vienna mine about a week ago, and there is not now one idle man in town. Additional men are being put to work every day. Mr. Jessen, who is managing Smiley's Emma for the new owners, has just put half a dozen men to work, and will erect buildings and lay in supplies for permanent working. Superintendent Childs, of the Solace, is in Vienna, but not doing anything. He seems to be trying to make arrangements to lease the Vienna mill for a run of his ore.

MONTANA.

ORE.—*Inter-Mountain*, July 31: Drifting and stoping continue on the 150 foot level of the Poser. The first-class ore is sent for reduction to the Moulton mill. The second grade ore is accumulating on the dump which now contains over 600 tons on an average assay value of 30 ounces in silver. Crosscutting has begun from the 320-foot station of the Clear Grit. Active sinking continues on Clark's Colusa. The upper levels are producing about 40 tons of ore daily on mixed grades. A shaft is being sunk on the west Colusa, or Ganibetta, owned by the Montague Copper company. Sinking was begun soon after Mr. Saly Rauuheim left on such important business for New York and it has since been prosecuted to a depth of about 100 feet. Daily shipments of crude ore averaging forty tons continue to be made from the Liquidator. The equipment of the mine is now complete, a well appointed assay office having lately been added as a necessary precaution. The character of the product is somewhat changeable, and the extraction of the best ore is greatly facilitated by frequent assays. The Liquidator is a well managed property. The Mint, a prospect adjoining the Orphan Girl on the west, has been leased by Henry Thompson. The Moose shows some excellent ore in the north shaft. It looks like worthless talc, but assays handsomely. The Gagnon is looking well on the 600-foot level, and is producing considerable ore. The Anaconda has shipped no ore since the 26th inst., but will resume to-morrow. During the month 28,000 tons of ore were raised of various grades. This is almost a thousand tons a day. The record was never beaten in the history of western mining operations.

THE COLUSA SMELTER.—*Inter Mountain*, July 26: The smelting plant of the Montana Copper Company consists of ten calciners, six matting furnaces and one blast furnace. The average product of the mine is 120 tons daily, of which 75 tons are put through the concentrator, the remainder being smelted into matte without preliminary treatment. The matte product of the works is about 25 tons per day, assaying from 60 to 70 per cent copper and containing considerable silver. The blast furnace is not at present operating. During the present year it is more than likely that the capacity of the works will be increased, but this depends partly on the nature of future contracts to be made by the company, and also on the work of development now progressing on the Parrot fraction and the Colusa. The mine is stated to be looking well and an important strike of high grade silver-copper ore is reported in the east 400 foot drift in an upraise. The company employs 225 men and ships over the Northern Pacific.

BLUE WING DISTRICT.—Dillon *Tribune*, July 28: Messrs. Trask & Graves, who are the owners of extensive silver mining properties in the Blue Wing district, and who also own large interests in the leading gold properties of the Bannack-Marrysville district, are putting a plant on the Ruby mine, which is located in the first named district. This is the first move toward revolutionizing the manner of working the Blue Wing mines, which have heretofore been worked by the slow and unprofitable way of hand-windlasses and man muscle for power to hoist ore and water. The steam hoist and pump are on the ground, and will be put in position shortly. In opening the Ruby drainage will be given to the Erie mine, another valuable property owned by Messrs. Trask & Graves. When the machinery is put in motion we will give a more detailed report of this mining enterprise.

STEADY PRODUCTION.—Butte *Miner*, August 1: The Liquidator keeps on the even tenor of its way. Operations are confined chiefly to the 300 ft level, and averages 100 tons a day, of which 40 tons daily is contracted for and taken by the Montana copper company at $15 per ton net. This gives the Liquidator people a steady income of $600 per day. Last month the Montana company took 1,200 tons of 25 per cent. ore, and this month the Liquidator will supply 1,100 tons, which will realize almost $20,000, as the ore will sample 28 per cent. On the dump are about 15,000 tons of low grade ore, worth as it is, $6 per ton, or $90,000. This, it is stated, will also be taken by the Montana company before the expiration of the contract, which will end in two months. It is in contemplation by Superintendent McDermott to remodel the old Clipper 5-stamp mill, and convert it into a concentrator for the treatment of the Liquidator product, which samples less than 20 per cent. This enterprise will render available, for extraction, a vast amount of ore in the 100 and 200 ft. levels of the mine, and will more than double the present output.

NEW MEXICO

GOLD GULCH DISTRICT.—Silver City *Enterprise*: The Gold Gulch district, as named at the meeting of the locators and miners of the camp, includes the country south of the Burro Mountain district, and runs from the Angle peak on the south of the Burros, 14 miles northeast of Lordsburg, west 25 miles to what is known as Flat mountain, thence 20 miles northeast to Round Top mountain, near Burro springs, thence circling to Angle Peak, the place of commencing. The district embraces Gold Gulch and Thompson's canon, and a large unexplored country west of soldier's Farewell. The new camp was named Malone, and is located about one mile east of Thompson's canon, near the largest mine in the district, if not in the territory, considering development. In no district that we have ever visited have we seen as large leads and deposits of mineral bearing quartz, and in the language of Col. Donahoe, of Knight's ranch notoriety, "The formation of the camp has put science at defiance. Mineral in nearly every form is found in nearly every formation known to mineralogy. The largest and best prospect in camp is in litigation, there being two claimants for it, which is much to be regretted. The Young Man claim, as it is located by Messrs. Rutter Bros., Mikesell and Ficel, and the Horseshoe claim, as it is known in dispute, by Messrs. W. P. Dorsey, Potter, Miller, Banker and Noel, is an immense outcropping of quartz running very high in gold and silver. The lead in place crops out at one point about forty feet in width, and the lowest assay from samples taken from this outcropping, is $15. There are two openings upon the claim, both of which are in good grade mineral, and the upper one of which is in extraordinarily high grade ore, considering the quantity. Flood & Mackey's expert, from California, who has carefully examined the claim, believes it to be the largest deposit of high grade mineral in the country, and intends to return with an assayer to carefully sample the property with a view to purchasing the same. The outcropping on the backbone of the mountain, upon which the claim is located, measures twenty-five feet from wall to wall, and is in good mineral the entire distance, scarcely a piece of the ore from which native, sulphide or horn silver cannot be found at a glance. The rock also carries from eight to twenty dollars in gold. Southeast of the initial location of the camp, several claims that have been discovered are being worked by the owners. Geo. Goodwin has also struck two claims, both of which show horn and sulphides, and the ledges give promise of permanency. In Thompson canon there is some gulch mining going on, but at present very little, if any, gold is being taken out. Mr. Alexander has built a dam about a mile from the mouth, and is experimenting on the "booming" system, but thus far has not had water enough to uncover the bedrock. On each side of the Young Man mine, Rascom Bros., James and Watts, have claims on which considerable development has been done, and on both of which good ore is opened up. These claims give promise of developing into fine mines with a little work. There are many other fine properties located within a short distance of the original find on which the same character of ore as that of the Young Man is found, and which lack but development to show them up. There are many prospectors searching the adjacent hills, and some good prospects are reported outside the ones above described.

OREGON.

CLEANING UP.—Jacksonville *Times*, August 3: Miners on Grave creek have finished cleaning up. Jack Layton, of Farris' gulch, will soon finish this year's run. Wimer & Sons, of Waldo, have about finished cleaning up for this season. Sargent Bros., of Steamboat, have resumed rocking, and are making good wages. Gin Lin is piping away at his diggings in Uniontown precinct, and seems to be doing well. Work still continues at the hydraulic mines of McCall & Anderson on the hill northwest of the Eagle mills. One thousand dollars worth of gold-dust was cleaned up at E. K. Anderson's diggings, southwest of Phœnix, this season. Goff & Co., who have excellent mines in the Grave creek district, made a successful run this season, everything considered, cleaning up a nice lot of gold-dust. Wm. Bleckert, of Gall's creek, was in town during the week, who informed us that the miners have done tolerably well, all things considered. A heavy storm in the mountains demoralized the Sterling's company's ditch for quite a distance one day last week. The damage done was repaired in a very few days, and cleaning up is again progressing there. Mr. Caldwell informs us that active operations have ceased for the season at the Steamboat mines. Considering the scarcity of water, the result has been favorable. A piece, weighing $25, was picked up in Caldwell & Son's diggings.

UTAH.

PARK CITY NOTES.—Park Mining *Record*, July 28: The lumber for the concentrator is on the ground and we are informed that work will be started on the same next week. The Smelter has been running for the past week, and the familiar sound of its whistle makes one feel as though good times were going to come to the Park again. The Parley's Park mine, which has been engaged in a search for the Ontario vein east for several years past, has finally given up, and the pumps, etc., have been raised to the surface and the mine shut down. A vein of ore has been struck on the City of Rome and Conkling mining claims, and the parties owning the claims feel greatly encouraged thereby, and intend pushing work right along on those claims. These claims adjoin the Black Bear and Disappointment mining claims. There has been quite a large land slide on Jupiter hill on the Gen. Dodge and Liberty mining claim. The slide took in a surface of over five acres and carried everything before it, but did not do any great damage, other than crushing in some fifty-five feet of tunnel on the Gen. Dodge claim. We understand that the owners of the Morning Star mining claim have leased the same to R. and A. Mulhall, and that work will be begun at once on that property. Work was commenced on the Crescent tramway on Wednesday, and it will be rapidly pushed along to completion. Mr. F. H. Dyer has taken the contract for the work, and has sub-leased part of the work to other parties. On the completion of the tramway the Crescent Company will have a way of getting their ore down from the mines that they can rely upon, and the route that has been chosen is one that is comparatively free from snow in the winter, and the grade is the lowest that could be found after a number of surveys, being about 400 feet to the mile.

REVIEW.—Salt Lake *Tribune*, August 1: The week has been a warm one, and the movement of the metals has been fairly active. For the week ending July 30th, inclusive, there were received in this city bullion aggregating $117,044.05 in value, and ore to the value of $0,320; total value, $126,364.05. The Horn Silver shipped in eighteen cars of bullion, valued at $54,000, making the aggregate shipment for the present year to date, $1,378,000, from which two quarterly dividends of $300,000 each have been paid. The Ontario shipped for the week forty-six bars of bullion, of the value of $32,914.05, making the total shipments of this company for the present year to date $950,996.44. The Crescent made three shipments of ore during the week, of the value of $9,320, being all the ore received. The Stormont sent up two bars of silver, assaying $2,080. The product of the Hanauer smelter for the week was nine cars of bullion, $25,450. For the first time in many months we have a car of bullion from the Park City smelter, showing that it is again in blast. The car is valued at $1,750. Mr. Hampton says the amount of ore in the Cave mine, Beaver county, and its general appearance justify the extension of a spur out from Milford to the base of Cave mountain, which has been talked of for more than a year, and which has only awaited the present condition of things to be done. So it is to be done. The Cave tunnel extends 1,200 ft into the mountain from the Cave; then an incline at an angle of 45 has been driven down from the end of the tunnel, where they have struck water. There is a tunnel below the Cave or main tunnel, 175 ft vertical, through which the mine was worked in the first years. A new tunnel, 2,100 ft long into the foot of the incline where the water is, has been begun, and 300 ft of it excavated, starting at the base of the mountain, 125 ft below the old tunnel. This is being driven in very cheaply, men working for their board, but to have their wages out of the first ore struck. No doubt ore will be struck before long, as the mountain is full of channels of ore, striking off in all directions and pitching at all angles, and winding about without apparent law or reason. Above this lower tunnel there will be hundreds, if not thousands, of feet of mountain full of these ore deposits to exploit and work out. The ore is the finest in Utah in some respects, the gangue being iron and invaluable as a flux. The Summit, which divides the hill with the Cave, something as the Eureka Con. and the Richmond divide Ruby Hill, has recently changed hands at $20,000, and development work on it, so far reasonably encouraging, is to be continued steadily.

THE CAVE.—Salt Lake *Tribune*, July 25: The Cave mine, in Bradshaw district, covers largely the face of a mountain rising 3,000 ft above Milford. The ore occurs in a series of channels or caves, now enlarging, now closing, but ever as they extend into the heart of the mountain, becoming richer and carrying a larger proportion of gold. The inner workings are taking more and more a direction at right angles with the face of the hill; in other words, pitching more and more downward. The working tunnel runs in 1,000 to 1,500 ft from Discovery Cave, and then, following the ore becomes an incline, at the head of which a hoisting engine has been set up, and the bottom of which has struck water. Steam is made in Discovery Cave, which is a vast natural rock "tepee," and taken in in pipes. It can be truthfully said of this mine that the more there is done on it, the more valuable it appears to be. It has been worked, more or less, these ten years, but its capabilities just begin to dawn on the owners.

THE HORN SILVER continues its output of about 140 tons of ore a day, and shows no signs of exhaustion. On the sixth level, in one place the pay ore is 200 ft wide, or thick. The chimney promises to be longer below. The new hoisting works are being erected and a new three-compartment shaft is approaching 300 ft in depth. The machinery and everything is designed to work to a depth of 2,000 ft. Water is expected at the level of Beaver river, perhaps 1,200 ft down the shaft. There is no known reason why such an ore chimney should not go down indefinitely. At all events, the owners would not willingly leave it short of the 2000-foot level. Mr. Fyson is opening a copper-silver lode in Newfoundland district, samples of which assay 16 copper and 126 silver. At a depth of 20 ft there are three ore veins within walls six or seven ft apart. Doubtless they will come together, deeper, and make a good strong vein of paying ore. One goes out there by the Central Pacific to Terrace, then by wagon.

WASHINGTON TERRITORY.

RICH COAL DISCOVERY.—Kiltitas *Localizer*, July 28: We hear from authority that is deemed reliable that the coal deposits on the Cle-el-um are unparalled in this country. The surface vein is said to be from twelve to fourteen feet deep, while an under-stratum, separated by a layer of slate, is being sunk down on, and is more than six feet deep, and the bottom not yet reached. This under-stratum is of a much better quality, and has a glistening jet color. Coal of the upper stratum is now in general use by the blacksmiths of this place, and they pronounce it an excellent article. Its value is being appreciated here so much that it is superseding the use of charcoal. The Cle-el-um coal-bed, where it is being developed, is the richest strike yet made in the Territory, and the quality of the second stratum, perhaps, the very best that has yet been discovered on either side of the mountains. It will be seen that the Cle-el-um district is not more celebrated for its rich quartz mines than for its valuable coal and iron deposits. We shall have more to say of this coal-find in our next, when we shall know more about it.

FROM CLE-EL-UM.—Cor. *Localizer*, July 14: Today Mr. Bills leaves here with a load of coal from the Cle-el-um mines, located about two miles south of Cle-el-um lake, and two miles northeast of Cle-el-um river. I saw an item in your paper that located this coal mine as being on the Teanaway. This is a mistake. The mine, from which the first load of coal was brought to Ellensburgh, is about twelve miles from the Teanaway—that is, from where it is crossed by wagon-road; and located as above described. Coal was found on the Teanaway about five years ago, by Geo. Verdin, but not in paying quantities. My first discovery of coal was made on the Snoqualmie pass about four years ago. The coal was of anthracite quality, and after locating thirty parties we went on prospecting for a paying quantity. We spent about $6,000, but without success. Hearing there was coal found in this part of the country, I came here last August to see for myself. I was successful in finding several veins near Cle-el-um lake, and some parties from both Seattle and Ellensburgh were located by me.

PESHASTIN NOTES.—Cor. Kiltitas *Localizer*, July 18: The Peshastin mines show more good rock at present than at any time since their discovery. The Hummingbird has about 500 tons of rock in sight that will mill from $15 to $30 per ton in free gold in the stopes. The lower level taps the ledge at a depth of 125 feet; and in the west face of the tunnel the formation indicates nearness to the main shute. The lead in sight is 15 inches in width of heavy sulphurets ore, that carries some free gold; the sulphurets carry from $80 to $300 in gold, which is worth $17 50 an ounce. Adjoining the Hummingbird is the Bob-tail, the vein of which will average about four feet in width for a distance of 200 feet, of ore that will mill $12 to $15 per ton in free gold, and there is about 75 tons on the dump. Adjoining the Bob-tail is the Schaffer lode, with a tunnel over 300 feet in length, in ore that varies from six inches to five feet in thickness, of ore that will average $25 a ton in free gold. The summit pocket has about 400 tons of quartz in sight that will pay from $20 to $60 to the ton in free gold. The company has a six-stamp mill on Peshastin creek, near the mines. This mill is a credit to the men who built it, considering that neither of them ever saw a quartz mill or mine before they went to Peshastin. The company has about 75 tons of sulphurets and tailings saved for other machinery, that is to be specially built for working base ores. There is also the Pole-pick mine, that has a good showing to become good paying property; and the Golden Phœnix, which is the richest free-gold mine in the district; the vein is from four to twenty inches in width, which if properly worked will pay $175 per ton. The sulphurets ore assays from $300 to $4,000 per ton. The ore in sight is sufficient to satisfy any experienced miner that the camp is destined to become one of the paying properties of the territory.

CHICAGO **FRASER & CHALMERS.** ILLINOIS

MANUFACTURERS OF IMPROVED AND APPROVED FORMS OF

MILL AND MINE MACHINERY.

Having made extensive additions to our Shops and Machinery, we have now the LARGEST and BEST APPOINTED SHOPS in the West. We are prepared to build from the Latest and Most Approved Patterns,

QUARTZ MILLS

For working gold and silver ores by wet or dry crushing. The Stetefeldt, Howell's Improved White, Brunton's & Bruckner Furnaces, for working base ores. Rotary Dryers, Stetefeldt Improved Dry Kiln Furnaces.

SMELTING FURNACES,

Water Jackets, either Wrought or cast iron, made in sections or one piece, either round, oblong, oval or square. Our patterns most extensive in use. SPECIAL FURNACES FOR COPPER SMELTING. Slag Pots and Cars, improved form. Bullion and Copper Moulds and Ladles, Litharge Cars and Pots, Cupel Furnaces and Cars.

HOISTING ENGINES Large or Small for flat or round rope. Double Cylinder Engines, from 6x10 to 18x60. This latter size furnished J. B. Haggin or Olant and Old Abe Co., Black Hills also Corliss Pumping Engines, 20x60, for Hoisting and Pumping Works, for 2,000 feet deep. **Baby Hoists for Prospecting, 4 H. P. to 6 H. P.**

Wire Rope, Safety Cages and any Size and Forms of Cars. **McCaskell's Patent Car Wheels and Axles—Best in Use.**

Principal Office and Works, Fulton and Union Sts., Chicago, Illinois. **New York Office, Walter McDermott, Manager, Room 32, No. 2 Wall St.**

Frue Ore Concentrator, or Vanner Mills.

Coarse Concentrating Works, Improved Jigs, Crushing Rollers, Sizers, Trommels, Rittenger Tables, and all other adjuncts for the proper working of Gold, Silver and Copper Ores, complete in every detail.

HALLIDIE IMPROVED ORE TRAMWAYS. We refer to Gen. Custer mine, Idaho, 5,000 feet long; Columbus Mine, Col., 4,750 feet long; Mary Murphy mine, Col., 5,000 feet long, all in constant operation.

LEACHING MILLS,

Improved Corliss and Plain Slide Valve Meyer's Cut-off Engines.

CORLISS ENGINES from 12x36 Cylinders to 30x60. PLAIN SLIDE VALVES from 6x10 to 36x36. BOILERS of every form, made of Pine Iron Works C. H. No. 1 Flange Iron, or Otis Steel. Workmanship the most careful. All Rivets Hand Driven.

SILVER PLATED

AMALGAMATING PLATES

FOR SAVING GOLD.

Used in Quartz, Gravel and Placer Mining

In any Size or Quantity Furnished to Order.

The Best Process yet discovered for saving fine Gold. Gold, Silver, Nickel and Copper plating on all metals. Old Tableware repaired and replated.

E. G. DENNISTON, Proprietor.

JENKINS PATENT VALVES.

Gate, Globe, Angle, Check and Safety.

Manufactured of BEST STEAM METAL. We claim the following advantages over all other Valves and Gauge Cocks now in use:

1. A perfectly tight Valve under any and all pressures of steam, oils or gases.
2. Sand or grit of any kind will not injure the seat.
3. You do not have to take them off to repair them.
4. They can be repaired by any mechanic in a few minutes.
5. The elasticity of the Disc allows it to adapt itself to an imperfect surface.

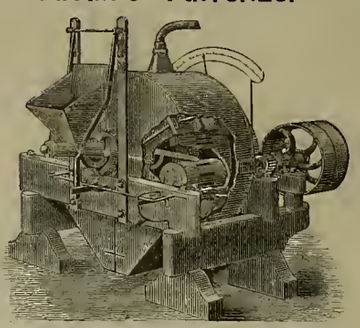
In Valves having ground or metal seats, should sand or grit get upon the seat it is impossible to make them tight except by regrinding, which is expensive if done by hand, and if done by machine soon wears out the valve, and in most cases they have to be disconnected from the pipes, often costing more than a new valve. The JENKINS Disc used in these Valves is manufactured under our 1880 Patent, and will stand 200 lbs. steam. Sample orders solicited. To avoid imposition, see that Valves are stamped "Jenkins Bros." For sale by

DUNHAM, CARRIGAN & CO., San Francisco, Cal.

A. T. DEWEY. W. B. EWER. GEO. H. STRONG. } **Dewey & Co.'s Scientific Press Patent Agency** { ESTABLISHED 1860.

INVENTORS on the Pacific Coast will find it greatly to their advantage to consult this old, experienced, first-class Agency. We have able and trustworthy Associates and Agents in Washington and the capital cities of the principal nations of the world. In connection with our editorial, scientific and Patent Law Library, and record of original cases in our office, we have other advantages far beyond those which can be offered home inventors by other agencies. The information accumulated through long and careful practice before the Office, and the frequent examination of Patents already granted, for the purpose of determining the patentability of inventions brought before us, enables us often to give advice which will save inventors the expense of applying for Patents upon inventions which are not new. Circulars of advice sent free on receipt of postage. Address DEWEY & CO., Patent Agents, 252 Market St., S. F.

Tustin's Pulverizer



WORKS ORE WET OR DRY.

Awarded SILVER MEDALS in 1882 and 1883 By Mechanics' Institute.

Mining Share Market.

Stocks have been on the down grade this week, much to the disgust of those who thought the rising market would continue for a while. There were no special developments to start them up in the first place. On the Comstock they are working away prospecting as usual. At the north end the joint Ophir, Sierra Nevada, Union Consolidated and Mexican winze is down about 58 ft below the 2300 level. Genuine quartz is now beginning to take the place of the bastard variety that has heretofore predominated. As yet this quartz gives no assays, but is metal-bearing in appearance. There are still encountered some detached blocks of porphyry. At the Sierra Nevada they are now advancing west crosscut No. 1, following up a diamond drill hole that was run last winter. At the Best and Belcher and Gould and Curry they are making rapid progress in the joint drift on the 2500 level, and are finding favorable material. At the Hale and Norcross they have explored for water in various directions with the diamond drill, and finding all safe, regular work was resumed on the 2800 level by a force of miners. The management are reticent in regard to the exact nature of their present operations. At Gold Hill the Yellow Jacket, Crown Point, Belcher and other mines that are at work on the old upper levels are taking out and shipping to mills on the Carson river the usual quantity and quality of ore. At the Alta they are pushing forward the west drift on the 2150 level. In about another week it will enter the fertile belt of ground (200 ft wide) that was tapped a short time since by the diamond drill.

Prompt Payment Needed.

It would be of great assistance to the publishers of this journal to have all its patrons renew their subscriptions promptly, save the expense of collections, avoid the changing and shifting of the position of the names on the printed mail list, and prevent some of the chances of errors occurring in addressing and mailing our very large list of subscribers. We, therefore, kindly urge upon all those who possibly can to renew their subscriptions early.

It is important to us that all not now paid in advance remit and place their credit ahead for a year. Verily every enterprising publisher heartily appreciates his list of promptly paying patrons. We hope our friends will not delay forwarding their postal orders because a single subscription is small in amount. We need the support of every intelligent person interested in the objects to which our paper is devoted. It is the interest of all such that the paper should be well sustained.

We have endeavored in every way to make this journal so valuable to its readers as to render it almost indispensable. No man can read it who will not likely find at least one or more single copies during the year, containing something worth many times the subscription price.

Bullion Shipments.

Hanauer, July 29, $11,500; Crescent, 29, $3,450; Horn Silver, 29, $8,294; Stormont, 30, $2,980; Hanauer, 30, $5,450; Ontario, 30, $4,104; Horn Silver, 30, $12,000; Park City, 31, $1,750; Crescent, 31, $2,270; Horn Silver, 31, $6,000; Ontario, 31, $4,248; Hanauer, Aug. 1, $4,500; Nevada, 1, $4,300; Horn Silver, 1, $12,000; Ontario, 1, $4,011; Hanauer, 2, $2,050; Park City, 2, $1,700; Horn Silver, 2, $3,000; Ontario, 2, $10,874; Bodie, July 3, $4,380; Bonanza King, 25, $8,530; Navajo, 28, $10,500; Contention, 25, $10,687; Standard, 28, $7,120; Bonanza King, Aug. 2, $12,532; Bodie, 5, $1,755; Navajo, 4, $10,000.

Secure the Reduced Rate.

After the first of April, 1884, we announced a reduction of the price of the MINING AND SCIENTIFIC PRESS from $4 to $3 a year to all who would settle up arrearages at old rates and pay *in advance* thereafter. There are some who have not yet taken advantage of this offer, and we would therefore urge all subscribers still in arrears to remit what is due us to this date, at the rate of $4 a year, and pay in advance for another term at the reduced rates for new subscriptions paid in advance.

Our Agents.

OUR FRIENDS can do much to aid of our paper and the cause of practical knowledge and science, by assisting Agents in their labors of canvassing, by lending their influence and encouraging favors. We intend to send ooos but worthy men.

JARED C. HOAG—California.
J. J. BARTELL—Sacramento county.

IMPORTANT additions are being continually made in Woodward's Gardens. The grotto walled with aquaria is constantly receiving accessions of new fish and other marine life. The number of sea lions is increased, and there is a better chance to study their actions. The pavilion has new varieties of performances. The floral department is replete, and the wild animals in good vigor. A day at Woodward's Gardens is a day well spent.

Mining and Scientific Press.

LEADING MINING JOURNAL OF THE WORLD.

Established in 1860, this Journal has been eminently successful as a popular and useful mining and mechanical journal. Relative to precious metals especially, it is the leading mining paper of the world.

It is largely patronized by the leading Miners, Mine Owners, Superintendents, Engineers, Metallurgists, Chemists, Manufacturers, Mechanics, Scientific, Professional and Industrial "Men of Progress" on the Pacific Coast, and many leading Mining Men throughout the mining fields of the world.

It is by far the best advertising medium in the Pacific States and Territories for Mining, Mechanical, Engineering Building and Manufacturing Tools and Implements, Goods, Supplies, etc.

Being thoroughly able and reliable in its editorial and business management, and long established in the most progressive industrial portion of the Union, at present, its power as an advertising medium is unsurpassed.

Subscription, $3 a year. Advertising rates, moderate. Send for samples and further information.

DEWEY & CO., Publishers,
252 Market Street, San Francisco

To Subscribers.

While our paper is, generally speaking, very prosperous, the publishers find themselves more than usually in need of money at this time, as our expenditures are constantly large. Those who have been waiting for busy times, or for other reasons, before renewing subscriptions and making payments to this office, are now kindly urged to favor us at as early a date as possible. Also, please remember that it is a good season to suggest to others that they, too, profit by subscribing. We hope to hear from many within the next few weeks, from all along the line of our large subscription list of intelligent and appreciative readers.

COMPLIMENTARY SAMPLES OF THIS PAPER are occasionally sent to parties connected with the interests specially represented in its columns. Persons so receiving copies are requested to examine its contents, terms of subscription, and give it their own patronage, and, as far as practicable, aid in circulating the journal, and making its value more widely known to others, and extending its influence in the cause it faithfully serves. Subscription rate, $3 a year. Extra copies mailed for 10 cents, if ordered soon enough. Personal attention will be called to this (as well as other notices, at times), by turning a leaf.

Cheap Ore Pulverizer.

There is for sale in this city, by I. A. Heald, American Machine and Model Works, 111 and 113 First street, a Rutherford Pulverizer, an improved revolving barrel crusher, which was only used a few times and is as good as new. It will be sold very much below costs, and miners who are in need of such an appliance for a small mine will do well to make inquiries concerning it. It is suitable for a pulverizing mill for powder or other substances. References as to above can be had upon applying to this office.

Don't Fail to Write.

Should this paper be received by any subscriber who does not want it, *or beyond the time he intends to pay for it*, let him not fail to write us *direct* to stop it. A postal card (costing one cent only) will suffice. We will not knowingly send the paper to anyone who does not wish it, but if it is continued, through the failure of the subscriber to notify us to discontinue it, or some irresponsible party requested to stop it, we shall positively demand payment for the time it is sent.

PATENTS AND INVENTIONS.

List of U. S. Patents for Pacific Coast Inventors.

[From the official list of U. S. Patents in DEWEY & Co.'s SCIENTIFIC PRESS PATENT AGENCY, 252 Market St., S. F.]

FOR WEEK ENDING JULY 29, 1884.

302,021.—CHIMNEY—L. L. Clawson, S. F.
302,025.—ORE ROASTING FURNACE—M. B. Dodge, S. F.
302,828.—CABLE GRIP—Dods & Hindes, Va. City, Nev.
302,833.—REVERSIBLE PLOW—W. H. Foye, S. F.
302,843.—FORCE PUMP—L. Herbert, Hicksville, Cal.
302,850.—ACID FEEDER FOR SODA WATER APPARATUS—Thos. Kendall, S. F.
302,851.—ESCAPEMENT—A. W. Kientoff, Dallas, Or.
302,852.—SHIRT—L. Lemos, S. F.
302,576.—TRACK CLEARER—Thos. S. Manning, S. F.
302,766.—SAW SHARPENING MACHINE—Thos. O'Connor, S. F.
302,630.—STEAM ENGINE.—J. B. Pichlord, S. F.

Patents Allowed.

Among patents recently allowed, and not yet announced, we are at liberty to mention the following which will soon issue:

TWO WHEELED CART—F. A. Knox, Woodland.
DENTAL TOOL—Grace & Miller, S. F.
SAFETY CAR TRACK—J. Denechaud, S. F.
MOP AND BRUSH—W. J. Mills, Oakland.
PLOW—A. H. Fitch, Santa Cruz.
MILL STONE IRONS—Geo. Summerton, S. F.
GRAIN SCOURER—J. C. Hunt, Chico.
HORSE SHOE NAIL—J. C. Simpson, S. F.
WHIP SOCKET, OIL CAN AND WRENCH—C. L. Bard, San Buenaventura.
WINDMILL—Saunders & Bentley, San Jose.

NOTE.—Copies of U. S. and Foreign Patents furnished by DEWEY & Co., in the shortest time possible (by telegraph or otherwise,) at the lowest rates. All patent business for Pacific coast inventors transacted with perfect security and the shortest possible time.

Notices of Recent Patents.

Among the patents recently obtained through Dewey & Co.'s SCIENTIFIC PRESS U. S. and Foreign Patent Agency, the following are worthy of special mention:

WAGON BRAKE. T. J. Sparks, assignor of one-half to Robt. McDonald, both of Oroville, Butte Co. No. 302,359. Dated July 22, 1884. This new brake for wagons, consists in straps applied to the upper semi-circumference of the wheels, one end of the straps being secured to a transverse beam or bar under the wagon bed, and the other attached to cranks on a rock shaft at the back of the wagon, by which means they are tightened down on the wheels to brake them, or lowered to relieve them.

BALING PRESS.—Jacob Price, San Leandro. No. 302,355. Dated July 22, 1884. It consists of an upright press, the bale being formed in a chamber at the top by a succession of charges which enter through an inclined feed-throat or hopper at the bottom of the press, into which the material to be baled is placed, and the hopper closed after each charge is received, until it has been forced into the baling chamber by a vertically-moving follower. It also consists in a mechanism for operating the follower, an eccentric of variable power by which this mechanism may be operated, retainers by which each charge is held in place while the follower descends for a new charge, and the means by which the horse-power lever may be disconnected from the mechanism by which the follower is moved, so that the latter may descend without stopping the horse or changing the direction of his movements.

REVOLVING ORE-ROASTING FURNACE.—Miles B. Dodge, S. F. No. 302,025. Dated July 29, 1884. This is one of that class of furnaces in which the body of the furnace is rotated during the process of roasting. The invention consists of a roasting chamber, having its interior composed of parallel surfaces extending from end to end, provided with flanges, and means for revolving the chamber, combined with a fire-box, a dust-chamber and chimney.

SAW TOOTH. John J. Bowen, S. F. No. 302,317. Dated July 22, 1884. The invention relates to improvements in saw plates, into which independent teeth or cutting bits and bit holders are inserted, and it consists of a supplemental segment fitted with a correspondingly curved and grooved recess in the saw plate, where it is held by a rivet or suitable device, said segment having its front adapted to receive the rear portion of the bit and bit holder, and operating as an intermediate holder between them and the saw plate itself.

GRAPE CRUSHER AND STEMMER.—Pierre Sainsovan, San Jose, Cal., No. 301,629. Dated July 8, 1884. This machine for crushing grapes and removing the stems consists in two novel revolving crushing rollers, an underlying vibrating sieve, and an intervening alternately-acting series of reciprocating rakes operating over the sieve; and it consists in the mechanism by which the parts have imparted to them their proper motions, and in certain details of construction. The object is to provide a simple and effective stemmer.

SIDE HILL PLOW. Ira B. Kilgore, San Jose, No. 305,341. Dated July 22, 1884. This invention relates to that class of plows in which the plow bottom is pivoted and is adapted to swing on a longitudinal horizontal line from one side of the standard to the other, to adapt it for use on hillsides. The invention consists of a novel pivot connection between the plow-bottom (the combined share and mold-board), and the land-side, as a means for securing said plow-bottom when adjusted in place, in a novel combined double standard and land-side, and in a novel point of connection between the handles and the standard.

ONE OUT OF A HUNDRED HEARD FROM.—C. Muller, 135 Montgomery street, desires to inform our readers that he is not the optician interviewed by the *Chronicle* reporter, issue of February 12th, as he does not claim as his own, nor require Berringer's Patent Optometer, Rochester, New York, or any other as his own invention. There are many pretenders and would-be opticians, but very few frank enough to confess it. Some opticians claim exclusive mechanical facilities for suiting the eye, and acknowledging their utter incompetency when pathological difficulties present themselves. No swindling or make-believe pretensions resorted to at my establishment. Physical and Physiological Optics are my daily study. With over thirty years practical experience, I can confidently solicit all who have eye difficulties to avail themselves of my professional service free of charge. C. MULLER, Optician, 135 Montgomery street, San Francisco. 1

Scientific, Mining and Other Valuable Books.

PUBLISHED OR SOLD, WHOLESALE AND RETAIL, BY DEWEY & CO., MINING AND SCIENTIFIC PRESS BUILDING, S. F.

BY GUIDO KUSTEL,

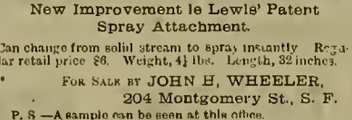
MINING ENGINEER AND METALLURGIST.

CONCENTRATION OF ORES (of all kinds), including the Chlorination Process for Gold-bearing Sulphurets, Arsenurets, and Gold and Silver Ores generally, with 120 Lithographic Diagrams. 1887.

This work is unequaled by any other published embracing the subjects treated. Its authority is highly esteemed and regarded by its readers; containing, as it does, much essential information to the Miner, Millman, Metallurgist, and other professional workers in ores and minerals, which cannot be found elsewhere in print. It also abounds throughout with facts and instructions rendered valuable by being clearly rendered together and in single order. It contains 120 diagrams, illustrating machinery, etc., which alone are of the greatest value. PRICE, $7.50.

ROASTING OF GOLD AND SILVER ORES (Second Edition) and the EXTRACTION of their Respective Metals without Quicksilver. 1880.

This rare book on the treatment of gold and silver ore, without quicksilver, is liberally illustrated and crammed full of facts. It gives short and concise description of various processes and apparatus employed in this country and in Europe, and the why and wherefore. It contains 156 pages, embracing illustrations of furnaces, supplements and working apparatus. It is a work of great merit, by an author whose reputation is unsurpassed in his specialty. PRICE, $3, coin, postage free.



Is the Best Pump in the World. Another New Improvement le Lewis' Patent Spray Attachment.

Can change from solid stream to spray instantly. Regular retail price $6. Weight, 4½ lbs. Length, 32 inches.

FOR SALE BY JOHN H. WHEELER,
204 Montgomery St., S. F.

P. S.—A sample can be seen at this office.

SURVEYORS—INVENTORS.

ELECTRIC AMALGAM.

$2 per pound, $1 per half pound Trial Bottle, Post Paid.

SEND FOR TRIAL LOT and CIRCULARS.

THIS IS AN ABSOLUTE STORAGE OF ELECTRICITY,

Saving Gold, Keeping Plates Bright, Soft, and Clean, Prevents Flowering and Sicking of Quicksilver.

UNITED STATES ASSAY OFFICE, 30 WALL ST.

NEW YORK, July 9, 1884.

Electric Amalgam Company—GENTLEMEN: We have analyzed a sample of your Sodium [Electric] Amalgam, which gave 2½ per cent of Sodium. We have used 10 parts of common quicksilver on a small quantity of free gold ore, and extracted 5 ounces per ton. By use of 8 parts of common quicksilver and 2 parts of your Amalgam, extracted at the ratio of 36 ounces per ton. Yours respectfully, (Signed) TORREY & EATON.

DR. J. H. RAE, Agent, 7 Exchange Place, Boston, Mass.

ECLIPSE DOUBLE TURBINE WATER WHEEL.

Points of Superiority:

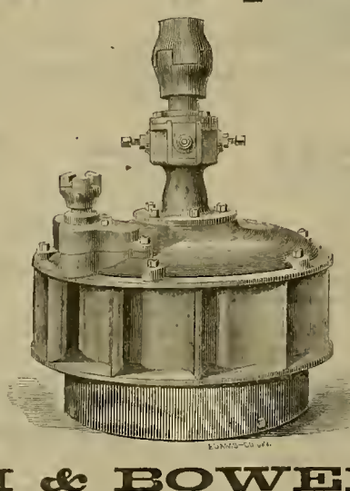
FIRST.—Simplicity, being composed of the smallest possible number of parts.

SECOND.—The Wheel, Outer Case, Register Gate, and Top, each being one casting, and all the work on them being performed by machinery, and fitted to a standard gauge, secures the highest perfection in construction and operation, and the utmost strength.

THIRD.—The entire absence of rods, bolts, levers, light castings, or "traps" of any kind, securing the greatest durability, with entire immunity from derangement of parts and breakage, so common in all complicated wheels.

FOURTH.—The conical interior of the wheel, which secures perfect freedom of vent for both tiers of buckets, enabling the wheel to rid itself immediately of "dead water" without friction. This feature is entirely original with this wheel, and is found to be of very great practical importance.

FIFTH.—Its "Duplex Chute," formed by the Register Gate and outer case. The outer case moulds the current of water, delivering it in a solid body through that part of the Chute comprised in the Register Gate on to the wheel. This Chute being fixed, the direction of the



current is never changed, nor its velocity checked, consequently nearly the same per cent. of power is obtained with the gates only partially drawn as when fully open.

SIXTH.—A Gate thoroughly protected from vertical pressure, which, when partially closed, does not break the column of water or change its proper direction, which is easily operated, and yet shuts so tight as to prevent leakage; and the shutting of which is not likely to become obstructed or prevented by foreign substances.

SEVENTH.—The housing up of the pinion and segment for operating the gate, which entirely prevents all danger of breakage by foreign substances getting between the teeth. No other concern does or can use this improvement, which effectually does away with a source of most frequent annoyance and delay.

EIGHTH.—The amount of power it yields, together with its Simplicity, Durability and Strength, fairly entitles our wheel to the name given it, The Eclipse Turbine. In further proof of the power of this wheel, we invite a careful inspection and comparison of our tables with corresponding tables for all other similar wheels.

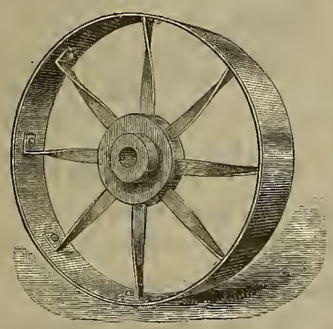
MACBETH'S
—PATENT—
STEEL PULLEY.



Advantages of these Pulleys.

They are less than half the weight of cast-iron pulleys; are polished on the face; are made either crowned or straight, and are turned in the lathe the same as the best make of cast-iron pulleys.
They are carefully balanced. They are subject to no contraction strains, and can be run at very high speed without danger of bursting.
On account of their great lightness and the form of the arms, they absorb less power than any other pulley.
They are *the only pulley of the kind* which runs true. They cannot be broken in transport.

TESTIMONIAL:
MATHER LANE SPINNING Co. (Limited), LEIGH, ENGLAND, Nov. 5, 1883.

N. Macbeth, Esq. —Dear Sir: The Patent Steel Pulleys supplied throughout to our No. 2 Mill are working to our entire satisfaction.
They are very true, and are about 50 per cent lighter than the cast-iron pulleys in our No. 1 mill.
Yours faithfully,
For the Mather Lane Spinning Co. (Limited),

TESTIMONIALS.

ST LOUIS, MO., Sept 26, 1883.
Messrs. Adolphus Meier & Co. GENTLEMEN: We cheerfully certify that the "*Heine Patent Safety Boiler*" put up by you in our establishment has proved very satisfactory in its working. The chief points of excellence in the "Heine Safety Boiler" are its economy in fuel and space, freedom from scaling, aptitude for power and heating purposes, working equally well with clear and muddy water. We warmly recommend it to all using steam machinery. Yours truly,
ANHEUSER-BUSCH BREWING ASS'N.

OFFICE OF SUPT OF ROYAL RAILWAYS, BERLIN, Sept. 23, 1883.
To Mr. H Heine, Civil Engineer: In reply to your inquiry of September 2d, we respectfully inform you that the three boilers built under your patents, under steam since September 25, 1881, at the Alexander Place Depot, as well as the two at Friedrich Strasse Depot, under steam since September 22, 1882, have given good satisfaction, requiring no repairs whatsoever to date. The internal cleaning of the boiler was always accomplished with ease on account of the convenient arrangement of the tube caps, the adhesion of scales being fully prevented thereby, and the boilers kept in prime condition.
(Signed): BRAUCKE.

WATER JACKET SMELTING FURNACES
—FOR—
Galena Silver & Copper Ores.

The PACIFIC WATER JACKET SMELTERS embrace many features that are entirely new and of great practical utility, which are covered by letters patent.
No other furnaces can compare with these for durability and in capacity for uninterrupted work.
MORE THAN ONE HUNDRED of them are now running on the Pacific Coast, giving results never before obtained as regards continuous running, economy of fuel, grade and quality of bullion produced. We are prepared to demonstrate by facts the claims here made.
These Smelters are shipped in a complete state, requiring no brick or stone work, except that for the crucible hus saving great expense and loss of time in construction.
Complete smelting plants made to order of any capacity and with all the improvements that experience has suggested as valuable in this class of machinery. Skilled and experienced smelters furnished when desired to superintend construction and running of furnaces. Estimates given upon application. Send for circular.

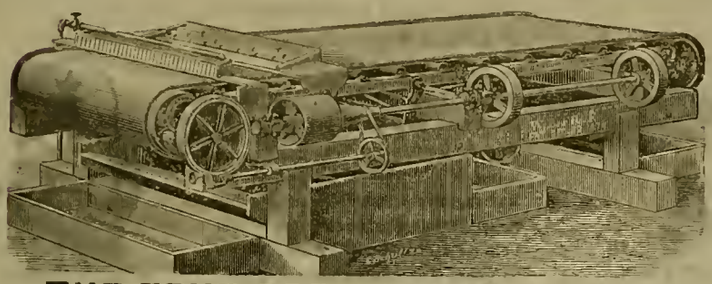
$1,000 CHALLENGE!



THE FRUE ORE CONCENTRATOR, OR VANNING MACHINE.

PRICE REDUCED, Jan. 1, 1884, to FIVE HUNDRED and SEVENTY-FIVE DOLLARS ($575.00).

OVER 800 ARE NOW IN USE. Saves from 10 to 100 per cent. more than any other Concentrator; concentrations are clean from the first working. The wear and tear are merely nominal.

A machine can be seen in working order and ready to make tests at the office of Hinckley, Spiers & Hayes, No. 220 Fremont Street, San Francisco.

To those Intending to Manufacture or Purchase the So-called "Triumph" Concentrator, we Herewith State:

That legal advice has been given that *all shaking motion* applied to an *endless traveling* belt used for concentration of ores is an infringement on patents held and owned by the Frue Vanning Machine Company.

That suit has been commenced in New York against an end-shake machine similar to the Triumph, and that as soon as decision is reached in the courts there, proceedings will be taken against all Western infringements.

That we are and have been ready, at any time, to make a competitive trial against the Triumph, or any other machine, for stakes of $1,000.

MINING AND SCIENTIFIC PRESS.

An Illustrated Journal of Mining, Popular Science and General News.

BY DEWEY & CO., Publishers.

SAN FRANCISCO, SATURDAY, AUGUST 16, 1884.

VOLUME XLIX. Number 7.

New Rock Pulverizer.

William Corcoran, of this city, has patented through the MINING AND SCIENTIFIC PRESS Patent Agency, a crusher and pulverizer of novel form. There is an exterior case, in which a hollow cylinder or drum rotates on a shaft. Another cylinder lies inside the drum or cylinder, so low that its outer periphery comes in close proximity with the inner periphery of the drum at its lowest point. This inner cylinder is supported on a separate shaft, which projects through the opposite side of the case from that which revolves the drum. The inner cylinder has bars, driven diagonally across the face in dovetailed slots, by which they are firmly held so that their outer faces project above the face of the cylinder. The inner surface of the outer drum has similar bars in dovetailed slots, and in the opposite direction from the angle of the bars in the inner cylinder, so that when the two rotate in opposite directions there will be a shear-like action between these bars and shoes.

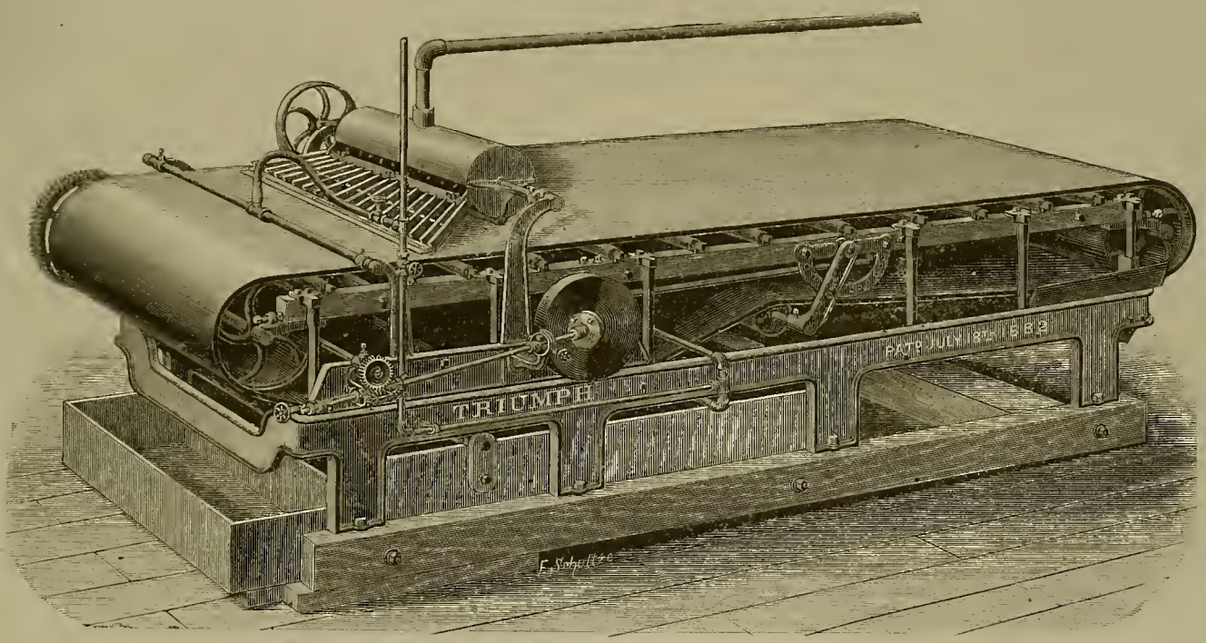
In order that the shaft of the inner cylinder may drive it, and at the same time allow the cylinder to adjust itself to the varying quantities of rock that may be beneath it, an oval hub is keyed to the end of the shaft, so as to fit loosely within a large oval opening in the center of the cylinder. When the shaft is turned the hub presses against the sides of the opening, and thus drives the cylinder. The rock or ore is fed in so as to fall through between the two cylinders, which rotate in opposite directions, and soon pulverize it to sufficient fineness, and it is carried up and discharged through a pipe through the action of a suction fan. When the diagonal bars or shoes become worn, the case is removed, cylinders taken out, and the bars or shoes driven out from opposite sides. As these bars receive most of the wear, it is only necessary to replace them to have the machine again in good working order.

The peculiar movement of these oppositely moving, diagonally placed bars or shoes is to produce a shearing action on the material passing between them, and it is thus rapidly reduced. Whenever these bars become worn on one edge, the machine is run in the opposite direction, the position of the discharge-pipe being changed to correspond, when the opposite edges of the bars take the wear. The drum settles and adjusts itself to the wear as fast as it takes place.

"Triumph" Ore Concentrators.

On this page is an illustration of the new and improved form of the "Triumph" Ore Concentrator, as now constructed by the Joshua Hendy Machine Works, No. 39 to 51, Fremont street, this city.

A competitive trial between this machine and the Frue was lately made at the mill of the Original Empire M. and M. Company, the celebrated gold producing mining property in Grass Valley, Nevada county, this State, under the personal supervision of the manager and superintendent of that



THE "TRIUMPH" ORE CONCENTRATOR, WITH LATE IMPROVEMENTS.

valuable estate. The facts and figures which are herewith given are compiled from reports furnished by David McKay, Jr., Esq., the Superintendent, and are therefore authentic.

"This competitive test was made between two of the 'Triumph' concentrators, and an equal number of 'Frue' vanners; each taking respectively an equal delivery of the ore pulp from two adjoining batteries, of five stamps each; the four machines being placed in pairs, side by side, and pulp troughs and pipes being so arranged that perfectly uniform distribution of all of the pulp passing from the aprons of the two mortars was maintained over the four concentrators. The run continued unintermittingly during a period of twenty-four consecutive days of twenty-four hours each, with these conclusions.

"Four hundred and fifty tons of ore were crushed under the stamps of the two batteries, the pulp of which, after passing over silver plated copper plates, was equally distributed to the four concentrators on trial and the following results were obtained:

"The 'Triumph' concentrators produced 21,159 pounds of concentrates, which yielded, after deducting the cost of chlorination, $1,713.22 net, while the 'Frue' vanners yielded 18,180 pounds of concentrates, of a net coin value, after deducting cost of chlorination, of $1,514 07, showing a gain in U. S. gold coin of $199 15 in favor of the 'Triumph' in the value of concentrations; to which is still further to be added the waste amalgam saved after passing the plates, and retained in the feed-bowls of the 'Triumphs,' which amounted to 40 ounces, of a coin value of $4 50 per ounce, or equivalent to $180, which is properly to be placed to the credit of those machines, as none was saved by the 'Frue' vanners."

"We therefore have as the net resultant gain of the 'Triumph' over the 'Frue' value, of concentrations, $199 15 amalgam and $180 = $379 15, or a net saving of $15 80 per day for the two 'Triumphs,' which sum will reimburse their cost price in, say, two months of use—in other words, a saving of $1 70 per ton for each ton of ore treated during the run."

We deem it to be pertinent to present the above facts and figures to the mining public, for the discovery of the best methods and devices for the perfect concentration of the valuable metallic particles existing in gold, silver, galena and other ores, has long engaged the earnest and assiduous attention of scientists, chemists, metallurgists, millmen and others, and the machine or device, be it called concentrator or vanner, which will produce, under equivalent conditions of operation, a more perfect concentration of the valuable metallic elements of ores, and a consequent increased yield of the precious metals of commerce, is entitled to a distinguished rank in the long line of concentrating machines which have been devised, constructed and operated. And as "competition is the life of trade," we invite, at the suggestion of the manufacturers, the attention of the mining public to the practical operation of one of the "Triumph" concentrators at the Joshua Hendy Machine Works, Nos. 39 to 51 Fremont street, this city. The machine shown in the cut has all the late improvements, which make it much more effective than was the original concentrator.

The African Hydraulic Mines.

Advices were received here recently to the effect that the much landed gravel mines in the Transvaal, had proved to be failures. It will be recollected that some months ago there was a great stir made here on the subject, and a large lot of expensive machinery was purchased in this city and sent by rail to New York and thence to the gold fields. California men were selected to work the mines also. In England heavy companies were formed to purchase and work the mines, and it was thought a second California field of gravel mines had been found. It turns out now, however, that the prospects are by no means bright of the stockholders getting their money back, much less any profit on the transaction concerning the fields. The *London Mining Journal* has this to say: "The Transvaal Gold Fields have always been most cautiously referred to in the *Mining Journal* in answer to inquiries made. It has been asserted that gold is very widely disseminated in various parts of the country, but that there are very few facilities for working, and no deposits which are at all likely to pay dividends to share-holders in companies with heavily loaded capital accounts. A correspondent referring to the subject says—'Reports from the gold fields are not quite of so rosy a hue as some of the projectors of the huge bubbles would like to read.' I see it reported that 'Professor Heddle's report on Lisbon-Berlyn will not be so satisfactory as the directors could wish.' It is expected (says the *Cape Argus*) 'the professor will demonstrate that the expenditure is far too high ever to allow of a dividend being paid.' Well, people with common sense and any knowledge of gold mining demonstrated long ago that huge enterprises of the Emma pattern under such expensive and ornamental management would never pay. The system of inaugurating gold mining companies after the style of the Balkis and Lisbon-Berlyn and others of that style must as a natural consequence come to grief—a big list of high sounding names as directors and managers. Shareholders, &c., will not pay dividends out of poor ground. Then what becomes of the exaggerated reports of the value of the ground were these reports written to order to suit the oily tongued promoters to deceive the susceptible public, who subscribed for shares on the faith of them and the respectable names on the directory."

English vs. American Policy.

England, despairing of holding her own in the cotton markets of the world, is resorting to the desperate policy of transferring a large portion of that industry to India, where she hopes to utilize the cheap labor of her two hundred and fifty millions of serfs, who are glad to give a day's work for ten cents and count fifteen hours to the day. Although this movement is only in its infancy, still her capitalists have already upwards of seventy cotton factories now in operation there, with about 19,000 looms.

This experiment is a most dangerous and demoralizing one, as is already becoming apparent to the intelligent and thoughtful English statesman. England originally planted herself in India with the expectation of founding there, or rather of building up in that region, a large market for her home productions, and incidentally securing the control of certain products, under her own rule, for which she would otherwise have to depend upon foreign and more or less hostile nations. But scarcely have the people of that region been educated up to see and feel the ordinary wants of civilization before her capitalists engage in the work of putting into the minds and hands of those people the intelligence, skill and tools to supply themselves with their new-found needs. England did not do so with her American colonies. Perhaps they taught her a lesson in that direction which she does not care to have repeated. The policy may be all right, ethically considered, but its damaging effect upon the English people will be all the same, and its demoralizing tendency upon the masses will be none the less for the moral and civilizing aspect which it assumes.

In fact the movement has already become a disturbing element, not only among the masses at home, but also among the capitalists there who have invested their means with the view of giving employment to their own people and seeking a market for the products of their labor in India. Notwithstanding the consumption of cotton goods is rapidly increasing in India, their importation from Great Britain is falling off. Within the last three years the falling off has been about 10 per cent. And what is still more significant, India is already entering foreign markets with her manufactures in direct competition with the United Kingdom. Indian statistics show that the importation of piece goods from India to China rose from 15,000,000 yards in 1880 to upwards of 41,000,000 in 1883! Moreover, hitherto the bulk of the Indian trade in general has been largely with the United Kingdom, but now the complaint comes up that that too is falling off. Carefully prepared statistics show that the total amount of decrease in this direction from 1877 to 1882 reaches within a small fraction of 10 per cent!

The fact elsewhere noted in these columns, that of the 40,000,000 spindles which represent the cotton manufacturing industry of this date in England, at least 20,000,000 are running at a loss, 2,000,000 are idle, and only eight out of the 18,000,000 remaining are holding their own, speaks volumes to the thoughtful statesman as to what the near future may bring forth.

And it is not in the cotton industry alone that India looms up as a future rival to the home Government. She shows very nearly a similar development in the jute fabric; also in the manufacture of boots and shoes. Coal, iron, steel, paper and leather are also being produced. Raw cotton is also being largely produced there, while her production of wheat is getting to be enormous, and has already seriously affected the market for American wheat among the buyers of Europe. In these two latter cases, England may be the gainer, and the United States the loser.

But taking the aggregate, England, by her own act, is brought into direct competition with the cheap labor of India—the cheapest labor in the world. That step is already telling with fearful effect upon her idle, starving masses at home. What will they do about it? But one way seems open to them—emigration to this country, where the true policy of home protection prevails. We have a country large enough and broad enough for all the intelligent, skillful, but down-trodden masses of Europe—large enough to give them all a farm. We have no entangling alliances abroad; but we do not seek either to control or incorporate into our body politic the ignorant, half civilized people, who may be found either upon our outlying borders, or in more distant regions. We are willing to extend to all such, a kindly, helping hand. We would do what we reasonably can to raise them to the level of civilized humanity, and look for our reward simply in the satisfaction of serving a neighbor and accepting the incidental and greater benefit that would naturally accrue from contact with an industrious and civilized people, over a half civilized, ignorant and idle people.

We have adopted the policy of keeping out from our borders all objectionable classes. We want none but such as can assimilate with us. We have already put up the bars against Asiatic half civilization, and we are now engaged in strengthening them. We have a similar work to do with the ignorant pauper labor of other parts of the world. That work will soon be one. But we welcome with open arms, intelligent and skilled labor, such as comes to us in good faith, to accept our policy of protecting ourselves; to sustain a free and popular form of government, to establish and encourage the family relation and the christian form of marriage. Such people always come with something wherewith to help themselves. They make good citizens, good neighbors, good commonwealth builders. We have room for all such. We bid them welcome—welcome to our broad acres, welcome to our shops, and welcome to all the relations of life and business.

The policy we have adopted is self sustaining. With a land, stretching from the northern Arctic to the southern tropics, we can produce everything we need, and live comfortably and respectably while we produce it, and we don't propose to allow the pauper, or serf labor of outside nations to interfere with our internal relations. We propose to raise our own food, our own raiment, our own luxuries, our own circulating medium, and everything we need or want, and to allow the producer such a fair compensation for his labor, as will enable him, and his family, to live as an intelligent civilized man should live.

We have within our own limits, the best market on earth, and we propose to hold it against all countries. Our people stand unrivalled in education, in mechanical skill, in productive power, and in mercantile aptitude. Our country is without a rival in the variety, or quality of its productiveness. There is no country on the globe, that can come nearer to absolute independence of all others than our own. We can provide our own markets, and when we have a surplus, we have the markets of the world to chose from. Our cereals, our staples, our fruits, our manufactured goods of every class have no superior, anywhere, and our skilled and intelligent labor aided by the best mechanical appliances is, as a general thing, able to cope with the cheap labor, and less skillful appliances of all competitors. When the need comes, we can enter all the great markets of the world.

We now number but 50,000,000 of people; but we have room enough for five or six times that number. And when our present limits are full, and we need more room, we shall know where, and how to get it—the whole boundless continent, may be ours from the northern to the southern Arctic.

Smelting and Concentrating in Butte.

The Butte, Montana, *Miner* says: In the increase of facilities, which has been general at all the reduction works of the camp during the past season, the improvements in the smelting and concentrating works have been notable. The introduction of

Anderson's Concentrator

Has been regarded with great interest by mining men, who have watched its operation with great interest since the arrival of the machinery and its erection in the vicinity of the Longmaid concentrator. Steam was turned on for the first time on Wednesday morning and a very successful trial run was made. It was the first run of the first concentrator ever manufactured of the Anderson patent, but a two hours' trial convinced those interested that the theory and principle of the invention was correct, and that with the surmounting of trivial mechanical difficulties the new concentrator will accomplish the most sanguine expectations of the inventor. A longer run will be made next week, when the *Miner* will give the practical results of an important invention of one of our own citizens, which is expected to produce important changes in the treatment of the low-grade ores of the district. One of the most important

Smelting Enterprises

Which has ever been inaugurated in the camp is the new smelter, calcininer and concentrator now being erected by Messrs. Farrell, Migeon and associates on the Parrott mill site. The capacious buildings for the new works are rapidly nearing completion. The process of reduction to be used by the new works is a French importation, the success of which is said to have been practically demonstrated in France. The calcining furnaces and concentrating jigs will differ but little from those already in operation at local smelters, but the process of reduction through the reverting furnaces is the secret which the patentee and his Johnny Crappo representatives decline to divulge; nevertheless those who are interested in the experiment and are putting up their money to the tune of something in the neighborhood of $150,000 seem to be confident in their belief that the new process will enable them to turn out matte nearly ingot fine, or equal to Chili bars, which are 98 per cent fine. Whether or not this result may be achieved, some of our most experienced operators and heaviest capitalists are interested in the enterprise. They have had their representatives in France for months investigating the matter, and it is altogether probable that their knowledge of the process is such that the erection of the extensive works for treatment of ores is not a mere experiment, and the public may be content to await developments in an enterprise which promises so much for the development of our copper interests.

A MINING COMPANY of Deadwood offers to send to the New Orleans Exposition this fall an exhibit of gold bullion in one solid piece, worth $500,000 providing the various counties of the Territory will unite in defraying the expense of transportation.

The Advantage of the Positive Man.

It has become a well-worn adage that "nothing succeeds like success," but it is not so generally noticed, however, that the next most successful thing is the assumption that the circumstances must be bent and the success must come. It has often been noticed that two men may start upon a business or profession with about equal talents, opportunities, capital and education, and one achieves an unbroken series of successes, while the other fails, and that, too, without any vices or follies that can be made responsible for the failure. This difference of fortune is sometimes called chance, and we hear many people every day bewail their "bad luck," as though they had been wrecked because the winds and waves of an arbitrary predestination were against them. But in the school of a true philosophy there is no such thing as luck. Chance is merely a name for an unexplained cause. No doubt, in many cases this unknown cause may be found in the environments into which a man has been thrown by events over which he had no control, but in the majority of instances it will be found to be an inherent defect of character. Perhaps one of the most common reasons for misfortunes is the lack of self-confidence and a positive force. Of course it will be admitted that an excess of self-esteem is a common infirmity of modern society, and that those who are afflicted with it are exceedingly offensive and disagreeable, but in the struggle of life these distasteful qualities are better than the excessive modesty, the shrinking timidity which tamely consents to be run over and crowded into a corner. It will not be denied that there are many admirable characters who lack nothing to insure their success except a certain snap, nimbleness and pluck-born of a determination to win.

When the angel troubled the waters of the sacred pool, it was the bold invalid who first plunged in who was cured, while the others trembling, hesitating, dallying on the brink, lost the prize. So it is in the affairs of every day life. One cannot always adopt Davy Crockett's admirable motto: "Be sure you are right, then go ahead," for a man must sometimes go ahead feeling his way, casting out the sounding lead. It is certainly desirable to be right, but it is not necessary to take the affidavits of the whole neighborhood before one concludes to venture. It was not the invalid who was reading the advertisements of the cured, that first stepped into the sacred waters. He who lacks the capacity to decide rapidly and accurately what is right, is certain to be rapidly left behind by his more prompt competitors. It is better sometimes to start on the wrong track in a hurry, than to be always behind on the right road.

In dealing with our fellow man, it is interesting to notice the value of being positive. The calm, accurate, logical and unbiased man never exercises the same influence over others possessed by quicker and narrower men. A man who sees only one side of a subject, and who is positive—albeit he may be in error—that he is right, will carry his hearers by his own earnestness to a conviction, which all the logic and argument of his cold, slow-moving, and somewhat indifferent opponent cannot shake. For every dozen who can take in the latter's finished argument, and icy glitter of rhetoric, there will be hundreds who will only weigh the manner of the speaker. Human nature in the man invariably judges others by itself. The lawyer whose personality is not vigorously thrown into his brief, whose faith in the case does not glow in the argument, will be disregarded, while a determined and passionate appeal, uttered as if coming from the speaker's inmost soul, will sweep men's minds irrespective of reason or justice. The doctor who brings no positive assurance of hope to the bedside of the sick, who shows by his doubt and uncertainty that he is beating in the dark, may as well stay away, for he fails to create that confidence that is necessary to the success of the healing art. And so all through life, in many other ways, men who have the best of causes fritter their advantages away, because they trust more to the matter presented than to the manner of presenting it.

QUICKSILVER TRADE.—The exports of quicksilver last month were 1,472 flasks, including 1,000 to New York, now a favorite point of shipment, leaving only 472 flasks for foreign markets, of which Mexico took 369, Japan 100 and British Columbia 3. For the same month last year these exports amounted to only 272 flasks. There has not been a flask sent to Hongkong this year. The Chinese have since been buying altogether in the London market, where they can do better than here. At least, our people do not care to compete with London for that trade. The shipment by water for the first seven months of the year have been as follows:

	Flasks.	Value.
New York	5,950	$150,900
Japan	588	17,032
Australia	10	280
South America	70	2,070
Central America	38	1,064
Mexico	3,344	94,900
British Columbia	22	640
Totals	10,022	$286,805
In 1883	18,539	502,935
In 1882	21,798	638,441

This trade is only one-half what it was two years ago, which is progress in the wrong direction.

Wood River Mines.

From the letter of a correspondent of the Salt Lake *Tribune*, we take the following extracts concerning mining matters at Wood River, Idaho:

The more one becomes familiar with the Wood River country the more he is impressed with the idea that it is a country of wonderful possibilities. Five miles above Hailey, Deer Creek enters Wood River. Deer Creek is a stream of considerable size and is fed by numerous branches, draining the high hills for many miles. About five miles from Hailey we come to the first object of importance in the Bolton Hot Springs, where numerous jets of water having a temperature of about 130 degrees, combine to make up about fifty inches as it flows into the bathing houses, hotels and waste drains.

Mines.

A short distance above the springs, and on the south side is the well known Davitt mine, which was sold last season for $40,000, after which $65,000 was taken out in a short time. The Devitt and Silver King belong to the same company, which operate the two together with a shaft down ninety feet, and being sunk lower. They have good steam hoisting works, buildings and road, and are taking out ore and sending to market.

Above and on the same ledge is the Snow Fly owned by Judge Williams of Ogden and others, together with the Bon Ton, Washington and one other claim. They are taking out and shipping ore and the property is classed as good. Just across the gulch and far up the side is the Mountain View, owned by Fred C. Bradley. Last year he took out and shipped considerable ore, when the pocket became exhausted, but he had faith in its future, went to work, and after a hard winter's toil, the prospect brightens and it will please his many friends to learn that he is about to make a strike again. There are numerous prospects in this locality which give promise of developing well, but unfortunately work is not being done on them. Farther up stream a deep gulch enters from the southeast and is known as the Narrow Gauge. Some two or three years ago, S. D. Connor and John McGregor, two well known Salt Lake men, secured several mining claims here, designated as the Narrow Guage Group, among which were the Narrow Guage No. 1 and 2, the Bannack, and some others.

The Narrow Gauge Group was sold for $80,000 to John V. Farwell, of Chicago, nearly two years ago. He has good mines and is not out in the purchase. A concentrating mill handles twenty tons of crude ore per day. This concentrator was partly carried away by a slide last winter and has just been set to work again. At present twenty men are employed in mining. Last year they took out and sold about 500 tons first-class ore, at an average $148 per ton, it running 63 per cent in lead. Narrow Gauge No. 2 and the Bannack are now being operated. The latter has produced 700 tons of ore. The highest ore assayed from the group 680 ounces silver. The vein is about three feet on the Narrow Gauge. They are driving to tap a ledge found on the surface, and the tunnel is in 550 feet, with a water blast to supply pure air for the men. The ores are chiefly galena, with some carbonate and chlorides.

Passing down Eureka gulch we soon came to the Bay State, being developed by a tunnel by Col. E. A. Wall and which promises well. Farther down we come to the

Chicago Group.

Owned and operated by the two well known Utah miners, Bates and Boyd. The group consists of the Chicago, Parnell, Little Giant and Empire. Four years ago Bates and Boyd landed in Wood River with some capital, and striking these properties, went to work. They have pushed along, among many discouragments, but the amount of work done shows they have not been idle.

This mining district, in fact as a producer of ore leads all others in Wood River so far. There are employed all of 250 men within the district and the town is headquarters for them.

But the most interesting part of Bullion is the mines. At the head of the gulch is the Jay Gould mine and concentrating mill. These have produced well in the past, but are now idle and the property is in financial trouble.

Mayflower.

Next below is the well known Mayflower, first sold for $30,000, then for $375,000, and always a large producer. G. L. Havens is manager of the property, and he knows how to conduct such concerns. As it was on this property the cry that "Wood River mines don't go down" was first started, the following facts are of especial interest:

In 1881 the product of nearly 900 tons averaged 138 ounces silver and 68½ per cent lead.

In 1882 over 1,000 tons of ore averaged 151.90 ounces silver and 66 per cent lead.

Over 1,500 tons of ore in 1883 averaged 176.70 ounces silver and 64 per cent lead.

This season the average so far is 179 ounces silver and 67 per cent lead. Since these facts were learned, a car-load of ore amounting to over 17 tons went 249 ounces silver and 67 per cent lead. The output this year will bring the total for the four years up to fully 10,000 tons of first-class ore marketed, and the bullion product of the country will be indebted to the Mayflower for having added over $2,000,000

MECHANICAL PROGRESS.

Loss of Heat by Steam Pipe Radiation.

Much, says the *Age of Steel*, has been said and written regarding the saving to be made by the proper covering of steam pipes, boilers and other steam surfaces. And while in the main it is agreed, either tacitly or openly, that a saving of steam is made by the proper protection of steam surfaces, yet it is too often looked upon as something which might with propriety be done, but as causing so small a loss by its neglect that the expense of its accomplishment constitutes a somewhat doubtful experiment. Yet the same persons who thus regard this really very important matter, if convinced that by the substitution of a new style of boiler or an improved furnace could in time reap a profitable return, would not hesitate to incur the necessary expense.

With a view of ascertaining facts from authoritative sources regarding this matter we have procured a copy of a report of tests made, in which the covering used was Toope's patent covering, one well known to the world. The tests consists in ascertaining the amount of water condensed per hour from pipes of various sizes, both covered and naked. For our purposes tests of one size, viz., three-inch, under both conditions, will answer: The tests were not begun until the covering had become thoroughly heated and were then continued in each case through five hours time, during which time the condensed water was drawn off every fifteen minutes, and the steam pressure and the heat of the room noted similarly. The following is the record of the tests:

	Covered.	Naked.
Temperature of room	75	75
Steam pressure	50	47½
Temperature of steam	282.8	279.6
Ounces of water	52	137½

The results in the number of the ounces of water condensed shows the proportion of 52 to 137½ in favor of the covering. This shows only about 37 per cent, as much condensation with the covering applied as with the naked pipe. The question of covering, as in all practical problems, resolves itself to the simple point—will it pay?

In another case a series of experiments to determine the efficiency of non-conducting coverings instituted by Prof. John M. Ordway, of Boston, it was shown that a naked two inch pipe, carrying sixty pounds of steam, may condense 181 grams per foot per hour, while a covering such as we have referred to would reduce this condensation to say forty-five grams, thus making a saving of 136 grams per hour, or about 2.50 pounds of steam in a day of ten hours. Thus it is shown that covering 100 feet of two-inch pipe would save, in a year of 300 working days, coal enough to convert 88,800 pounds of water into steam. If we consider one pound of coal, as capable of making 8.8 pounds of steam we shall have a saving of five tons of coal per year for each 100 feet of covering. This experiment, it must be remembered, was made by using anthracite coal, worth say five dollars per ton at that point.

The Chalmers-Spence Company, of New York, have recently brought out an improved covering, consisting of consecutive layers or rolls of fibrous asbestos, made up in removable form, which costs twenty-two cents per foot, list, for two-inch pipe. This estimate would make a saving of over 100 per cent yearly on cost of this covering, while the covering once applied lasts for an indefinite period with ordinary usage. The saving, moreover, does not consist solely in the saving of fuel, for steam pipes uncovered become dangerous elements of fire, and in the mere matter of insurance a saving is effected, not to speak of the security one feels in the removal of this element of danger.

An impression also obtains in some minds that the covering of steam pipes, while desirable in the winter time, need not be done in the summer, or may be delayed until winter. The erroneousness of this will become apparent at a glance. Take, for instance, the temperature of live steam, eighty pounds, as 325°, and the average winter temperature as say 30°, with the summer temperature at say 70°; this basis, which we simply use as an illustration, leaves a difference of 40° of average variation, or only about 18 per cent of average loss in winter over that of summer.

In this connection we would remark that some experiments that would also settle with reasonable definiteness the loss of heat through the brickwork of ordinary boiler setting would be valuable. There are great differences of opinion on this subject, and careful experiments are needed to settle them.

BURNING WET OR DRY COAL.—The question of burning coal in a wet or dry state is still being discussed in the English journals, a large amount of both theory and practical information being set forth. One writer says that, although it is generally conceded to be true that wet bituminous coal will not produce as much steam in a boiler as dry coal, there are few figures to substantiate this. The result of a series of tests, made recently with much care, are regarded as having considerable weight in the determination of the points involved. It appears that a mass of washed slack, holding 18 per cent of water and 9 9-10 per cent of ash, evaporated 5 7-10 pounds of water per pound of fuel, while the same coal with only 3 per cent of water made from 8 to 8 5-10 pounds of steam; making due allowance for moisture by reducing to a standard of like quantities of coal free from moisture, a direct loss of 14 per cent is shown in using wet coal. In reference to this matter a contemporary says: Part of the prevalent impression as to the greater value of the wet coal is based upon the notion that in some way or other the water itself is converted into gas and burns with great effect, but this in the vast majority of cases is a delusion. The water on the coal as thrown on the fire must necessarily be slowly heated and at length fully evaporated by an absorption of heat from the burning fuel beneath it. The vapor thus given off passes away under the boiler and out at the stack, carrying with it a volume of heat corresponding to the temperature of the waste gas at the entrance to the stack, and also, what is far more important, the heat due to the conversion of this whole amount of water into steam. The whole of the heat thus absorbed is an absolute loss, and the more water there is in the fuel the greater this loss must be.

SHEET IRON AND SHEET STEEL. One of the large industries of the country consists of stamping or shaping very thin sheet iron and sheet steel into forms for various utensils and tin coating them. In many and most instances this is preferable to making articles out of tin plate, as the coating of tin completely covers edges and seams. The production of sheet steel is a growing industry. The United States Tin Plate Company, Pittsburg, whose works were burned last February have rebuilt the works of iron and have just completed a large ware house, and now have one of the most complete works of the kind in the country. The machinery was all made for the special purpose for which it is used, the manufacture of fine sheet iron and sheet steel. The capacity of the new works is 3,000 tons of refined sheet iron and steel per annum. It would be well if the government would place reasonable duty upon the foreign tin plate and enable this industry to become one of the pillars of our nation, giving employment to hundreds of thousands of Americans to do what is now done for us by England. The exports of tin plates from England to this country during the first four months of the present year reach the enormous aggregate of a fraction over 70,000 tons! and it is a product which might and ought to be supplied by our own home labor.

NEW PAPER PULP MACHINE.—Mr. G. H. Pond, according to the Glen Falls (N. Y.) *Times*, has devised a machine for the manufacture of paper pulp from saw dust. The working of the experimental machine was so successful that the inventor found no difficulty in interesting capitalists in the invention, and arrangements have been made by which a model machine will be built in that city immediately with a view of establishing a paper mill in which it is to be used. The paper further states that Mr. Pond's invention will work a revolution in paper manufacture. His experiments show that a fine quality of letter paper, as well as book, news and wrapping stock can be made from the product of his machine direct, thus doing away with the expense of beating engines and other ponderous machinery common to paper mills. He has made arrangements to establish a ten ton mill at once. Through his invention it is claimed that a ten ton mill can be put in operation for $50,000, when as by the present method of paper manufacture a mill of equal capacity will cost $150,000 or more.

A POINT IN WHICH AMERICANS SHOULD IMPROVE.—"In the appliances for doing work in boiler shops," says the *American Machinist*, "we are behind the British. Few American boiler shops are provided with the best appliances for bending plates, drilling, punching, flanging and riveting. Although the work turned out is just as good as can be produced on the other side of the Atlantic, the facilities for doing the work are generally inferior. There is room for great improvement in boiler shops."

AN EXPERIMENTAL STEAMBOAT.—The New York and Stonington Steamboat Line has recently launched a steamer which will have the true English type of an oscillating, compound, surface-condensing, direct-acting, side-wheel engine, the first in this country. The engine will have 10 feet stroke and feathering paddle-wheels. Her work will be looked forward to with great interest by steamboat men. All the machinery is on a level with the main deck. The boat will cost about $200,000. She is 305 feet long.

A CHANCE FOR INVENTORS.—The fire insurance companies of Sweden have offered a reward of 2,000 crowns for the most practical device to arrest sparks and cinders from locomotive and steamboat smoke-stacks. A trial of different devices that may be sent in will take place in Stockholm, Sweden, during the month of August, this year. Whether the award will be confined to the exhibitors at that time, we are not informed.

A SWIFT RUNNING ENGINE.—Durkee & Keffer are building a high-speed engine, designed to run 1,500 to 1,800 revolutions per minute, for electric lighting purposes. An especial feature of this engine is a very ingenious rotary automatic steam balance valve. The engine is made under patents recently granted to Dr. John Harrington, Caldwell, Kansas.

SCIENTIFIC PROGRESS.

Lunar Heat.

An interesting article on lunar heat, by Prof. C. A. Young, was published in the *Popular Science News*, from which we take the following: After mentioning the early investigations of the subject, Prof. Young speaks of Lord Rosse's experiments in 1868, which were made with the aid of a 3-foot reflector. "A moment's thought will show," continues Prof. Young, "that the moon's heat must consist of two portions. First, there will be reflected solar heat, the amount and character of which will depend in no way upon the temperature of the moon's surface, but simply upon its flooding power. The second portion of the heat sent us by the moon is that which she emits on her own account as a warmed body warmed, of course, mainly, if not entirely, by the action of the sun. The amount of this heat will depend upon the temperature of the moon's surface and its radiating power; and the temperature will depend upon a number of things (chiefly heat-absorbing power of the surface and the nature and density of the lunar atmosphere, as well as the supply of heat received from the sun), determined by a balance between give and take.

"So long as more heat is received in a second than is thrown off in the same time, the temperature will rise, and *vice versa*. This second component of the moon's thermal radiance must be mainly what is called 'obscure' or dark heat, like that from a stove or tea-kettle, and characterized by the same want of penetrative power. No one knows why at present, but it is a fact that the heat radiations from bodies at a low temperature have no such power of penetrating transparent media as the higher-pitched vibrations which come from incandescent bodies. A great part, therefore, of this contingent of the lunar heat is probably stopped in the upper air, and never reaches the surface of the earth at all. Now the thermopile cannot discriminate directly between the two portions of the lunar heat, but to some extent it does so, since they vary in quite a different way with the moon's age. The simple reflected heat must follow the same law as moonlight, and come to its maximum at full moon. The radiated heat, on the other hand, will reach its maximum when the average temperature of that part of the moon's surface turned toward the earth is highest; and this must be some time after full moon, for the same sort of reasons that make the hottest part of a summer's day come two or three hours after noon.

"The conclusion early reached by Lord Rosse was that nearly all the lunar heat belonged to the dark heat radiated from the moon's warmed surface, the reflected portion being comparatively small, and he estimated that the temperature of the hottest parts of the moon's surface must run as high as 500° F. Since the lunar day is a whole month long, and there are never any clouds in the lunar sky, it is easy to imagine that along toward 2 or 3 o'clock in the lunar afternoon (if I may use the expression) the weather gets pretty warm, for when the sun stands in the lunar sky as it does at Boston at 2 P. M., it has been shining continuously for more than 200 hours. On the other hand, the coldest part of the moon's surface, when the sun has only just risen after a night of 340 hours, must have a temperature more than 100° below zero.

"Lord Rosse's later observations modified his conclusions to some extent, showing that he had at first underestimated the percentage of reflected heat, but without causing him to make any radical change in his ideas of the maximum heat of the moon's surface.

"For some time, however, there has been a growing scepticism among astronomers, relating to the computations by which he inferred the high percentage of obscure radiated heat compared with reflected heat. Professor Langley, who is now engaged in investigating the subject, finds himself compelled to believe that the lunar surface never gets even comfortably warm—because it has no blanket. It receives heat from the sun, and probably some 25 or 30 per cent more than the earth, since there are no clouds and no air to absorb a large proportion of the incident rays; but at the same time there is nothing to retain the heat and prevent the radiation into space as soon as the surface begins to warm. We have not yet the data to determine exactly how much the temperature of the lunar rocks would have to be raised above the absolute zero (459° F.) in order that they might throw off into space as much heat in a second as they would get from the sun in a second. But Professor Langley's observations, made on Mount Whitney at an elevation of 15,000 feet, when the barometer stood at 17 inches (indicating that about 57 per cent of the air was still above him), showed that the rocks exposed to the perpendicular rays of the sun were not heated to any such extent as those at the base of the mountain similarly exposed; and the difference was so great as to make it almost certain that a mass of rock not covered by a reasonably dense atmosphere could never attain a temperature of even 200° or 300° F. under solar radiation, however, long continued. It must, in fact, be considered at present extremely doubtful whether any portion of the moon's surface ever reaches a temperature as high as 100°."

PURITY OF SEA AIR.—It has generally been thought, and direct observation has confirmed the notion, that the air above the sea is singularly free from the low forms of organic life. MM. Moreau and Plantymansion have taken advantage of their leisure during a voyage in the Gironde from Rio de Janeiro to Bordeaux to obtain some data bearing on this question. They have found that over the open sea, at a distance from the vessel, the air contained very little solid matter. The land breezes appear to become rapidly free from the multitude of organisms which they carry with them from populous districts. M. Miguel, of the Montsouris Observatory, regards the fall of germs into the sea as a reassuring fact; breezes blowing from the distant continents, which might otherwise bring epidemics with them, become purified, it is supposed, in crossing the ocean. The gentlemen above named have found that the atmosphere immediately about the vessel practically swarmed with micro organisms; the vessel seemed to be surrounded by an "atmosphere of microbes."

A New Coloring Matter.

Prof. C. F. Ritchel, of Bridgeport, Conn., has made some extremely interesting experiments with that pest of the household, the common moth, or rather the worm that comes from the eggs of the miller before it turns into a moth. The experiments are novel, and no account of them has been published.

"I first noticed," Prof. Ritchel said to-day, "that the excrement from the worm was the exact color and shade of the material it had eaten. I gave some of the worms red flannel as the first test, and the product was a beautiful shiny substance, the exact color and shade of the flannel. A very small quantity of this substance colored a large quantity of white lead. Knowing that modern artists could not mix black and white perfectly, or nearly even, and the difficulty of reproducing the color of gray hair, I gave my worms gray hair to eat. The result was very astonishing. They gave me a perfect coloring, the exact shade of the gray hair given to them. I mixed some of the coloring with white lead, and gave it to an artist, who was greatly astonished and pleased with it, and wondered how I got such a beautiful gray. I showed him a sample of the hair, and he said that it was a perfect match. I tested the coloring extract in many ways. I put some of it on a plate on the roof of my house, protecting it from the dust and rain with a glass. After an exposure of two months, I could not discover change in its appearance or shade.

"I am convinced," Prof. Ritchel continued, "that this was the method used by the ancients to produce their indellible and brilliant colors. I was told that such coloring as I had produced was worth many times its weight in gold. Lately I have stopped experimenting in this direction. For the benefit of art I would like others with time and inclination to take the matter up. All the apparatus necessary is a plain pine-wood box, with a smooth bottom."

GEOLOGICAL SURVEY OF MEXICO.—A project is under way among a party of American scientists to secure a contract with the Mexican Government for the organization and execution of a complete geological survey of the Republic. The primary purpose is to obtain accurate data as to the great economic resources of that country. Should the arrangements proposed be consummated, some of the best trained and most known geologists, naturalists, mineralogists, paleontologists and topographical engineers of this country will become interested. It is hoped also during the next administration to secure appropriation for such a complete and practical survey of the United States as is contemplated in regard to Mexico.

A NEW COFFEE PLANT.—A new coffee, called "Maragogipe," has lately been discovered in Brazil, and a commission was formed to investigate the qualities of the coffee and also of the plant, and they have decided entirely in its favor. Not only does it produce a larger crop, but the coffee berry is much larger, and possesses a very silky-looking smooth surface, with high quality flavor. It stands well on the high lands, and the first planters that have adopted it in Brazil are said to be so delighted with the results that they are cutting down their splendid coffee trees of the old variety of coffee and planting this new "Maragogipe" variety.

SUGAR IN MILK.—M. Paul Bert, the eminent French biologist, has been investigating the origin of sugar in milk. Two theories exist for explaining this phenomenon, one of which supposes that it is formed in the gland itself from milk-forming matter; the other supposes that it comes from the blood, and is merely stored in the breasts of animals. M. Bert has experimented with cows and she-goats, and found beyond doubt that sugar of milk is introduced by excretion in the breasts from sugar formed in excess by the animal. The sugar is apparently first formed in the liver.

EXPERIMENTS AT LOW TEMPERATURES.—Not only has oxygen been obtained in the form of crystals, as was lately announced, but Prof. S. von Wroblewski, Krakow, has also succeeded in causing nitrogen to fall like snow when subjected to a temperature of 303 degrees below zero, and in solidifying hydrogen. The extraordinary cold measured in these experiments was produced by the boiling of liquified oxygen on freeing it from pressure, and is probably the lowest temperature ever recorded.

TABLE OF CONTENTS.

EDITORIALS.—New Rock Pulverizer; "Triumph" Ore Concentrators; The African Hydraulic Mines, 97. Passing Events; Parallelograms in Mining Locations; Exploding Giant Powder without Caps; Separating Gold and Silver from Arsenide of Iron; Miners' Safety Lamp, 100. White Bronze; The Trouble at Tombstone; A New Silver Region; Smoke Abatement, 101.

ILLUSTRATIONS.—The "Triumph" Ore Concentrator with Improvements, 97. Monument Made of White Bronze, 100.

MECHANICAL PROGRESS.—Loss of Heat by Steam Pipe Radiation; Burning Wet or Dry Coal; Sheet Iron and Sheet Steel; New Paper Pulp Machine; A Point in which Americans Should Improve; An Experimental Steamboat; A Chance for Inventors; A Swift Running Engine, 99.

SCIENTIFIC PROGRESS.—Lunar Heat; Purity of Sea Air; A New Coloring Matter; Geological Survey of Mexico; A New Coffee Plant; Sugar in Milk; Experiments at Low Temperatures, 99.

USEFUL INFORMATION.—A Cork Grinding Machine; Tanning Linen; How Glass Beads are Made; Wood Carpeting; Phosphorous Paste; Whalebone Brushes; To Destroy Red Ants; How to Wash Old Flannels; Golden Streets; Carriages Made from Paper Pulp, 103.

GOOD HEALTH.—Heart Disease; How Much to Eat; Overcrowding the Principal Cause of Diphtheria; The Bite of a Mad Dog not Always Fatal; The Pulse of Smokers; Covering the Head; Crushed Ice for Burns, 103.

MISCELLANEOUS.—English vs. American Policy; Smelting and Concentrating in Butte; The Advantage of the Positive Man; Wood River Mines, 98. Facts about Wire Rope; Mineral Deposits in Contra Costa, 102. New River Mines, 103.

MINING SUMMARY.—From the various counties of California, Nevada, Arizona, Idaho, Montana, New Mexico, Oregon and Utah, 104-5

MINING STOCK MARKET.—Sales at the San Francisco Stock Board, Notices of Meetings, Assessments, Dividends and Bullion Shipments, 108.

Business Announcements.

Concentrators—Joshua Hendy Machine Works, S. F.
Situation Wanted—Wm. Wales, S. F.
Artificial Limbs—Menzo Spring, S. F.

Passing Events.

The most notable item in connection with the mining interests is that mentioned elsewhere of the trouble between the mine owners and Miner's Union, at Tombstone, but rigorous measures have been taken, the troops called in, and doubtless the whole thing will quiet down.

News has arrived that the much talked of hydraulic mines in Africa have not turned out as well as expected.

Butte, Montana, is making a phenomenal bullion production just now, and there are more profitable mines near that camp than in any in the United States at this time. The Utah mines, too, are doing very well. The strike in the Quijotoa mines, Arizona, is confirmed and will result in much benefit to the regious thereabout.

The topic of the hour is the strange adventure of the Greely Arctic exploring expedition, and the hardships and suffering they experienced.

A new silver region is reported in New South Wales, and the mines there are being vigorously developed.

Two thirty-ton copper smelting furnaces were shipped from the Pacific Iron Works recently for the copper mines of Lost River, Idaho. The furnaces will be erected on the smelter site the head of Willow Creek gulch, within 000 feet of the copper mines. They will run ough about eighty tons of local ore per day.

Parallelograms in Mining Locations.

Mining people applying for patents on their ground have found that thoy must comply to the rules of the Land Office with regard to the end lines of claims and that their plats must show locations in the form of parallelograms, or they would he rejected. This rule has been in vogue since the law of May 10, 1872 was enacted. On all claims located since that date this form of location has been required. It made some confusion at first, for claims of all sorts of irregular shapes had previously been made. It seems now, however, that the rule is not to be enforced literally as the Secretary of the interior has just reversed a rnling of the Commissioner of the Land Office, and decided that the form of a mining location need not necessarily be that of a parallelogram; but the mineral deposit must govern.

The claim which brought up the question is near Leadville, Colorado, where the mineral deposits are peculiar in form, and not in lode form, as generally understood. The plat of the survey of the claim showed a location, running northeasterly 875 feet, measured along the line marked "center of vein," thence southeasterly, at a right angle with its former course, 450 feet; thence northeasterly, parallel with its original course, 175 feet. It is thns 1,500 feet in length, measured along said "center of vein," and it is 300 feet or less between the side lines. The location which was made September 11, 1877, appears to he surrounded hy other locations on all sides. A few feet south of the center vein of the location, and at its western extremity, is the discovery shaft, and a second shaft appears some 600 feet to the eastward, being a few feet north of said center line. There appears to have been no discovery of mineral elsewhere in the location. Affidavits set forth that the underlying mineral is found as a comparatively level deposit, irregular in form, in no wise resemhling a fissure vein, and not capahle of being traced by its ontcroppings.

The decision of the Commissioner of the Land Office holds, "that as the peculiar conditions do not exist, that would make such a location satisfy the intent of the mining act, it will be necessary to amend the survey, so as to conform to all the requirements of the statute, Section 2320 R. S., as constructed by the Land Office, to wit: A lode claim must be to all intents and purposes essentially a parallelogram."

The Secretary of the Interior says in his decision that such a construction should be founded on the reason of the thing, or the clear intent of the statute. As to the former, he fails to perceive any reasonableness in the requirements of a parallelogrammic form. If a fissure vein deviates literally at an angle, it is reasonable, as the primary purpose of the statue is to grant the mineral, that the location should deviate with it. If the mineral is not deposited in a fissure, but in irregularly shaped masses, as in this case, then as it can in no wise affect the interests of either the United States or adjoining locators whether any given L shaped lot be covered by one or two locations, it is unreasonable to hold that it shall not be embraced by one location.

This decision is a very important one, overturning as it does the former practice of requiring all locations to he parallelogram, and the Secretary's reasons for his conclnsions are very interesting. He says in his decision:

Turning to the statute referred to it reads that "a mining claim located after the 10th day of May, 1872, may equal, but shall not exceed 1500 feet in length along the vein or lode," and that "no claim shall extend more than 300 feet on each side of the vein at the surface." It is apparent that the purpose of these provisions is to limit the dimensions of the location, and not to prescribe its shape. It is to be not more than 1500 feet long, and not more than 600 feet wide. The point of measurement selceted is the "vein," and if the measurements be made along and from the middle of a veiu which departs literally from its course at a right angle, it is obvious that the statute is satisfied. Precisely the same quantity of land and of lode is appropriated by an L-shaped as by an I-shaped location, where the length and width are determined from the middle of the vein. "There is no language in the Act" says the court in Wolfley vs. Lebanon M'f'g. Co. (4 Col., 112), "that requires the diagram to be in the form of a parallelogam or in any other particular form." I will go furtber and says that the language of the statute precludes the conclusion that it contemplated a parallelogrammic location. The requirement of such a shape might be inferred if the langnage bad been "no claim shall exceed 1500 feet in length by 600 in width;" bnt the introduction of the provisions requiring a measurement of length "along the vein," and of width from "the middle of the vein," plainly points to a reason for the selection of the central line of the location instead of the side line, and that reason must have been the possible tortuous course of the vein. There could be no practical purpose in selecting the middle of the vein as the place of measnrement except to provide for an appropriation of the same quantity of surface hy a deflecting as by a straight location.

Since the statute anthorizes an L-shaped or other irregularly shaped location in the case of a fissure vein, it must authorize it in the case of a horizontal deposit, such as is found in this case, if the reason of the thing does not forhid.

That such a deposit is within the meaning of be descriptive term "vein" or "lode" in the statute is settled (Stevens vs. Williams, 1 McC., 480), and I have said above that there are no practical considerations opposing it. Therefore I see no reason for objecting to the location in the ease before me, and reverse your decision.

Exploding Giant Powder Without Caps.

A miner, employed at Ivanpah, has hit upon a new way of exploding giant powder that may work a revolution in the use of that explosive. It has always been helieved that giant powder would not explode without the fulminate cap, and in the use of the cap was the great danger to be apprehended. Our miner, who, by the way, is a sailor, without any miner's experience, ran out of caps, and seeing no reason why the powder should not explode without, just placed his fnse in position, tamped his charge and ignited the fuse; the result was that it exploded as well as thongh a cap had been used. The result did not surprise him, but it did the miners, who at once began to experiment, and have been exploding giant powder without caps since, and find that it does just as well as with them, while the danger of premature explosion from the cap in tamping is avoided. No one thought of it before, and if our sailor had known more of mining he would not have thought of it.—*San Bernardino Times.*

The above item has been going the rounds of the press within the past few weeks, and it is perhaps just as well to caution miners on the subject. A good many people call all the high grade powders "Giant Powder." With Judson powder, made by the Giant Powder Co., the blasts may be fired in the manner mentioned. But the real Giant powder needs a special cap to explode it, to utilize all its powerful qualities. A miner may sometimes succeed in discharging a blast in the manner described above, if he tamps very firmly, but he will lose a good many shots. Even when very solidly tamped it is liable to miss-fire unless caps are nsed. The company do not advise exploding any of these nitro-glycerine powders without caps, because, with all that class of powders, the stronger the explosion in the powder the better the execution of the hlasts.

It has been found that even the triple-force caps do not explode every particle of the nitro-glycerine which is distributed through the powder, but particles of unexploded nitro-glycerine float like atoms in the air after an explosion, and are principally the cause of the miners' headaches when blasts occur.

When the Giant Powder Company in this city first made their powder they sent out ordinary single-force caps to nse with it. But it was found there were miss-fires, and the powder did not do as much exeeution as was expected. They then investigated the matter, and as a result made double-force eaps, and finally triple-force ones—that is, with three times the quantity of fulminate in them. Now they are even making quintuple-force caps, and several of the large consumers now order these quintuple force caps, finding they get better resnlts from the blasts.

In Europe this matter has been very thoroughly investigated, and there they recommend qnintuple-force caps, and say that the slight difference in price is of little moment, because it is an undeniable fact that the stronger the explosion in the body of any nitro-glycerine powder the more complete the explosion of every particle of nitro-glycerine. These facts should be known in connection with the item quoted, for when the powder is set off by a simple fuse there must be considerable nndecomposed nitro-glycerine left in the air, and the effect of the blast will be proportionately less.

ACCORDING to the Eureka *Sentinel* the Miners' Union have served a notice upon the Eureka Tunnel Consolidated Mining Company and the men working in the mine that hereafter miners will not be allowed to work in it underground on any other condition than $4 a day in coin. They had heen working for $2 a day in cash and $2 additional, making up the required $4, in stock of the company. The owners of the mine have determined to shut it down..

Separating Gold and Silver from Arsenide of Iron.

Mr. Edward Probert of Eureka, Nevada, has just patented through the MINING AND SCIENTIFIC PRESS Patent Agency a process of separating gold and silver from arsenide of iron. The arsenide of iron is first melted in a shaft, cupola, or other furnace, and then tapped out into iron pots lined with clay or other refractory substance. While the material is still in a fluid state and at its highest possible temperatnre, Mr. Prohert introduces a certain proportion of its weight of granulated lead or litharge into it. The litharge is reduced by the action of the deoxidiziug agents contained in the arsenide of iron, and the lead is precipitated, carrying down the gold and silver alloyed with itself. The granulated lead, when used as the equivalent of litharge, acts in a similar way, though with less effect, alloying itself with the silver and gold hy its affinity for those metals during its passage downward throngh the hath of molten material.

The material treated by Mr. Probert is shown by analysis to contain about 33 per cent arsenic, 60 per cent iron, with minute quantities of other metals, ineluding silver and gold. In order to remove the argentiferous or auriferous lead alloy from the pot, a small tapping holo is provided in the hottom, or the whole contents may he allowed to cool, and the lead alloy finally he separated after the solid block has been removed from the pot.

Of course the inventor is aware that litharge is universally employed as a flux in assaying and smelting ores; but in this operation it is nsed for the purpose of dissolving the metallic oxides and otber substances constituting ores, and is, therefore, a true flnx, and is used as such as well as to absorh the precious metals contained in the ores. But he has found that this process does not give as satisfactory results when arsenide of iron is present as that which he has discovered. The reactions do not take place as certainly nor as completely in ordinary smelting as by a subsequent treatment of the previously smelted arsenide with litharge or lead, and it is precisely in this subsequent treatment in pots outside the furnace that the value of Mr. Prohert's improvement consists. He does not, therefore, patent the nse of lithargc or lead for separating gold and silver from arsenide of iron in the ordinary process of smelting, but simply his process, which is to treat the previously smelted substance (arsenide of iron) with granulated litbarge or granulated lead, while it is still in a fluid state, in iron pots lined with refractory material to resist the corrosion, outside of and apart from the smelting furnace.

California at New Orleans.

The Central Pacific Railroad Company has decided to take in hand the matter of representing California's industries at the coming exhibition at New Orleans. They propose making here a complete collection of all California products—mineral, agricultural and industrial, and forward it to the exhibition. They will take samples of soils, fruits, eereals, minerals, manufactured articles, etc. The display will he made as a State display, and will be made as complete as it is possihle. Suitable persons will he sent in charge to describe and explain the exhibit. The company expects the people of the State to contribute, and the namcs of contributors will he appended to the articles. The railroad compauy will transport everything free, and prepare its exhibition free, taking charge of the whole thing. The eompany will co operate with the State Commissioner. There has been no appropriatiou made by the State for an exhibition, so that the railroad company will have to bear the expense itself. A number of county collections have been or are hein made, so that this action of the railroad people ensures California being properly represented at the great exposition.

THE Eureka *Leader*, in an article showing how well foreign capital bas succeeded in Nevada, says: Of the amount invested in this district by foreign capitalists, about $900,000 has come from England, and about $600,000 from the United States. Since the opening of the district less than $2,000,000 in assessments has been levied in our mines, while over $8,000,000 has been paid in dividends, showing an excess of dividends over assessments of over $6,000,000.

White Bronze.

White bronze is a comparatively new substance, but which has come into large use rapidly for special purposes. It has been found to be so particularly well adapted for statuary and monuments, that a company with extensive capital has been for some time organized in Detroit, and is making monuments of all kinds and styles from the value of a few hundred dollars up to $25,000. From exhaustive experiments made by this company it is found that the material will stand exposure to the weather and the ravages of time for thousands of years without detriment. Mr. James Linforth, 23 Main street, in this city, who is the agent for these monuments on the Pacific Coast, has investigated the subject carefully, and informs us that the material is practically indestructible. White bronze being non-corrosive, and unchangeable, is equal to gold, silver or platinum, and superior to copper or antique bronze, which throws off a verdigris. In color, white bronze is more appropriate than any kind of stone, the latter readily yielding to the action of the frost, and in addition to becoming moss grown and discolored, soon shows signs of disintegration. It is rare to find a monument, either marble or granite, free from cracks after twenty years' exposure.

These monuments and statuary are cast from refined zinc, and are given their sparkling appearance by the sand blast; sand being blown against the work, under a high pressure of steam, cuts the surface, but does not adhere to it. Aside from their durability, one of the principal advantages over stone is the legibility of inscriptions, which are cast in raised letters and will not crumble or become indistinct. By means of removable tablets, the monuments always present a finished appearance. Tablets not required for inscriptions at time of erection, are cast with appropriate emblems to be replaced by inscribed tablets when circumstances require.

The use of statuary in this country by private individuals, in the adornment of their cemetery lots, used either alone or in combination with a monumental pedestal, is of comparatively recent date. In the last fifteen years a decided preference for this class of work has been developing, and at the present time many of our largest and finest private monuments are surmounted by statuary. It is an admitted fact that stone statuary, more especially marble, will not withstand the effects of severe climate for even a few years, while copper bronze throws off discoloring matter, which not only renders the statue unsightly, but soon injures, if not ruins, the pedestal. White bronze is open to none of these objections, and will retain its original color and beauty for generations.

A thin film of oxide which forms on this bronze is indestructible by the elements. It cannot be dissolved by water and air cannot penetrate it, though the film is so thin as to be unmeasurable. No corrosion can take place.

The company which manufactures these monuments has hundreds of designs more or less ornamental in character. They are artistically planned, and the ornaments are appropriate. There is nothing to chip or break off. Some of the soldiers' monuments which they have made are very elegant, indeed. A sample of one of the designs is given on this page, though much more elaborate ones are made. Skilled artists are employed to make the designs, and skilled workmen complete the monument. Tablets, emblems, family and public monuments, railings, medallions, statuary and similar articles are made. The inscriptions are all in raised letters which form part of the monument, and cannot be broken off. Mr. Linforth has a large list of designs which he will show to any one interested. For our city, where the sea fogs affect stone and marble, so much, the white bronze ought to be specially valuable.

A number of scientists whose certificates are given in the company's catalogue, unite in saying: "The white bronze monuments are practically indestructable. They will not blacken or become dingy with age. Moss will not adhere or grow upon their surface as upon marble and the color will remain unchangeable while the monuments endure. Imperishable by nature and ever enduring in beauty. In our opinion these monuments will out last the foundations on which they stand."

A New Silver Region.

Australia has long been noted as a gold producing country, and now what bids fair to be an extensive silver producing region has been found. The mines are in the Barner ranges of New South Wales, near where the colony joins South Australia. Silver-bearing ores were first found there in 1872, by a shepherd, but the nature of the ore was not understood, and nothing was done. Two years ago a lot of ore was sent to England, this time with better results, though through inexperience the miners selected the lowest-grade ores, viz.: argentiferous galena. They netted the handsome return of £7 per ton on the shipment, after the highest commissions and charges had been exacted. Miners who were working silver properties in these parts were all making money before they sold out.

Now there has been an influx of miners and a town kown as Silverton, has been built up. The country is represented as inhospitable, rocky and mountainous. Over the whole of the great mountain chain are found localities of the precious metals, and following their leading structural idea, they arrange themselves in parallel zones of a similar nature to those of the Cordilleras and California.. Where the section of the formation can be examined there can be seen folds of more or less complexity, twisted and warped by longitudinal forces, and often compressed into a series of zigzags of a wonderful nature. The mines of this district consist of two groups. The one at Silverton embraces eleven claims, in which the ore consists of sulphides of lead or argentiferous galena. The profits secured on these ores amount to £12 per ton. About eight of these mines are opened up, six of them to a considerable extent. There is one shaft down 130 feet, carrying the lode very strong in the bottom. The lode at this point gives indications of turning from sulphides of lead into sulphides of silver. Fifteen shafts have been sunk on different parts of these eleven mines, their depth varying from 30 feet to 75 feet, one being 130 feet. The lode is disclosed in each of these shafts, and found to be of a thickness varying from 1 foot to 3 feet. Some rich returns are now being obtained from these mines, the ore yielding, as above stated, a clear profit of £12 per ton. The second and larger group of mines is situated at a distance of 28 miles from Silverton. They are called the Lakes Camp group. The ores here are purely sulphides of silver, and very rich. Two tons of ore recently sent to England for assay were sold for £600. Shafts have been sunk in many parts of the ground held by the syndicate, and ore has been discovered everywhere, but, of course, all of it is not of the richest quality.

The lodes have all the appearance of permanency. In one shaft, the deepest of this group, the lode has been traced to the total depth—75 feet—and at the bottom it is six inches thick, with indications of continuance and improvement. A great drawback to the rapid development of these mines is the scarcity of labor at Silverton.

MONUMENT MADE OF WHITE BRONZE.

Prospecting is very lively along the whole line of the Carson and Colorado, from Hawthorne to the terminus of the road. The Virginia *Enterprise* says the railroad is a great convenience to prospectors in many ways. It carries their traps and provisions from place to place, and when they have found a vein that will pay, it carries their ore to where it may be brought to mill test and reduced. Small lots of ore are constantly being sent in to the Douglass mill, at Dayton, either to be tested or reduced. Now, too, there are beginning to be mills and furnaces at the other end of the road, down in Inyo, to which ore may be sent.

Fuse Works Burned.— A dispatch from Santa Cruz dated August 13th says: The Eagle Fuse Works, on the Zayante creek, near Felton, were entirely consumed by fire this afternoon, including a large amount of valuable machinery. The works were owned by W. H. Talbot & Co. and have been in operation since 1869. The process of manufacture is a family secret and the loss is not definitely known. The factory turned out about 1,000,000 feet of fuse a month.

Trouble at Tombstone.

We have before mentioned the fact that there has been trouble at Tombstone, Arizona, between certain mining companies and the Miner's Union owing to the determination of the former to reduce wages from $4 to $3 per day, and for three months many men have been kept out of work. On the morning of the 9th about three o'clock, after the night shift had left the Grand Central mine, an armed mob went to the works and fired into them. The Tombstone *Epitaph* says: "The guards, seven in number, were then organized for resistance, expecting what was to follow. Soon a union man came to the door and asked the stereotyped question of Mr. Leach if he intended to continue work at $3 a day, to which that gentleman replied by making the emissary a prisoner. Not long afterwards several shots were fired into the building from behind a woodpile on the upper side of the works, which were promptly returned by the guards, and in the excitement of the moment the prisoner managed to escape. About a hundred shots in all were fired, and sixty empty shells were found this morning behind the woodpile. Whistles were sounded to alarm the town, and the mob rapidly retreated. The most singular thing about the entire transaction is that not a man is known to have been hurt in the past twenty-four hours, although it is whispered that a certain union man wishes he had been elsewhere on the occasion."

The next day the following notice was published signed by Wallace Corbett, C. S. Butterman, C. W. Leach, Casper Taylor, C. W. Goodale, and W. J. Fee. "To whom it may concern. Unless the Miners Union of Tombstone, formally disband before 3 p. m., Sunday, August 10th instant, and deliver over to the Sheriff the ring leaders of the cowardly assassins who made an armed attack on the Grand Central hoisting works last night, no man whose name is now on the roll of said union can ever have any work at any price on the mines or property of the companies represented by the parties whose signatures are hereto affixed."

A dispatch from Tombstone dated the 12th, says: "Since the attack on the Grand Central hoisting works everything has been quiet. This morning Captain Tisdale, with Company C, First United States Infantry, arrived from Fort Huachuca and has gone into camp at the Sulphuret mine, near the scene of the recent attack. Sheriff Ward, denied having made any requisition on the Governor for troops, deeming the civil authority amply able to preserve order. The troops are here, however, and will probably remain until all probability of trouble is over. About 200 men are at work, which force will be increased largely in the nearfuture. In a few days work on the new pump at the Grand Central will begin. The future prospects of the camp are bright."

Miners' Safety Lamp.

Some months since we mentioned the fact that an English gentleman, Mr. Ellis Lever, had offered a prize of $2,500 for a safety miners' lamp which would fulfill certain conditions. The matter was referred to a committee of experts, who have just reported. The adjudicators have had to examine 108 lamps; of these four were electric lamps and 104 oil lamps, of which a few were designed to burn mineral oils. With respect to the electric lamps, there was not one which fulfilled or approached fulfilement of the conditions of the award. All the lamps which fulfilled the preliminary requirements were submitted to a series of experiments of progressively increasing severity. These experiments, based upon the experience gained by the Royal Commission, and by experiments instituted by other bodies in this country, were calculated to fulfill even exceptional conditions to which lamps may be exposed in actual practice. While there was a consiederable number of lamps which behaved satisfactorily under the normal conditions existing in mine workings, the number was reduced to very few as the extreme tests were reached. Of these there is no one lamp that perfectly fulfills the whole of the conditions enumerated, and the adjudicators are consequently unable to make the award to any one of the lamps submitted. Among the best there are two which the adjudicators regard as deserving of special mention, viz., the Marsaut lamp, with three gauzes, which most nearly fulfilled the conditions, and the lamp of Mr. William Morgan, of Pontypridd, South Wales, which presents several good features of marked originality.

Production of Pig Iron.—A dispatch from Pittsburg, Pa., says: From present indications the scheme to restrict the production of pig iron by hanking up all the furnaces in the country will be successful. Secretary Weeks of the Iron Association has received responses from 200 furnaces, and of these 121 are unqualifiedly in favor of the plan and will support it. If a shut-down is ordered it is prohable that there will he a general suspension of the coke works also, as 75 per cent of the coke made in the Connellsville region goes to pig-irou furnaces.

Facts about Wire Rope.

Iron, which within the last two or three decades has invaded the province of so many other materials, in the arts, has also become a large competitor with hemp, being now extensively employed in the manufacture of ropes, for haulage in mines, for the heavier parts of ship's rigging, as a substitute for belting, and for many other purposes. In some uses it has almost superceded hemp.

Iron ropes used in Germany about 1831 for hoisting purposes in Hartz mountains were made from long iron rods laid side by side and untwisted, being wound spirally around by wires to keep them in place.

The earliest record we have of wire ropes made from wires twisted together into strands and the strands laid into ropes is from the patent of Andrew Smith of Prices street Leicester square, in the county of Middlesex, Eng., who in January 12, 1835, obtained a patent for "a new standing rigging for ships and vessels and a new method of fitting and using it;" and in March 26, 1836, he obtained a patent "for an improved mode of manufacturing bands, belts and straps to be employed in place of ropes and chains and for other useful purposes," followed by patents for improvements in the same, Dec. 21, 1836, March 20, 1839, and later; and Appleton's Dictionary of Mechanics for 1852 give results of tests of Mr. Smith's wire ropes.

The first wire ropes as we understand ropes in the present day were made from a number of small wires set up on spools back of a stationary laying plate containing a series of holes arranged in circles around a center hole, *i. e.* 6 holes around one, then 12 around 6 and 18 around 12, etc. The wires were pulled through these holes and formed into strands by a revolving machine which receded from the laying plate along a track on a long rope walk. These strands were afterward laid up into ropes in a similar manner to hemp ropes. But about 1845 Mr. Smith invented a machine for making wire rope strands of untwisted wires, and this is the principle on which wire ropes are made to the present day. Mr. Andrew Smith, in 1831, had invented iron shutters and he found that the ropes he used for counterbalances were often destroyed by rats, and as a substitute for these ropes he experimented with cords made from fine wire. In 1836 he established rope works in Great Grimsby and later at Millwall near London, in both of which places Mr. Binks was for many years his foreman.

Flat wire ropes were originally made from bunches of fine wires laid parallel and forming strands which were bound together by being woven in a loom with tarred spun yarn or marline as a woof, the bunches of wires forming the warp, afterward some twist was given to these wires, and eventually a series of four stranded ropes laid alternately right and left handed were sowed together by wires running at an angle crossways formiug the flat wire ropes of the present day.

Mr. Melville Atwood, the well-known mining engineer of this city has probably had the longest experience of any man living, having used one of Andrew Smith's wire ropes over 40 years ago.

Wire rope was introduced into the United States a few yeas after it found its way into England. It was first employed on a large scale upon the inclined planes of the Portage railway, over which the hoats of the Pennsylvania canal, divided into sections, were transported across the Alleghanies. The roads of the Delaware and Hartford Canal Company soon after adopted them. The success in these instances led to the adoption of still heavier ones—2 to 2½ inches in diameter—upon the inclined planes of the Morris and Essex Canal of New Jersey.

The use of wire rope for hoisting purposes is now almost uuiversal. It is used for a great variety of other purposes. One of its most important uses is that for

The Transmission of Power

From one locality to another, when the distance to be traveled is such as to render belting unsuitable. At Frankfort-on-the-Main the power of a 10 horse-power turbine is transmitted 3,200 feet to a cotton factory, which is situated on a convenient position. Wheels 13½ feet in diameter are used, and they make 114 revolutions per minute. A ⅝-inch wire rope is used; stations, 400 feet apart. A series of powder mills, embraciug the various shops where the compounding, grindiug, sifting, glazing, etc., are carried on, are arranged in a series around the circumferenee of a circle of 1,200 feet radius, the machinery being driven by wire ropes from a water wheel in the center of the circle. The buildiugs are isolated by traverses, and have the heuefit of the detached situation without the uecessity for separate motive powers.

At the falls of the Rhine, near Schaffhauseu, a number of turbines are placed, having an aggregate of 600 horses. This is transmitted diagonally across the river to the town, which is about a mile lower down, and then distributed, advantage being taken of certain rocks in the river as foundations for the carrying rollers.

Another notable instance of the trausmission of power by wire rope may be found at Oberursel, Nassau, where a 175-horse water power is transmitted by a single wire rope for a distance of 3,150 feet, divided into eight spans. The useful effect of the 175 horse-power transmitted is found, by careful measurement, to be 99 horse-power. The ropes are .59 inch in diameter and run with a speed of from 55 to 60 miles an hour, over pulleys 14.8 in. diameter. It is claimed that power can he thus conveyed through distances of six and seven miles and upwards.

More recent experiments have demonstrated that wire ropes can be run over quite long distances more economically thau by dividing up into sections.

In this city there are numerous examples of wire rope transmission at the Risdon Iron Works and at the California Wire Works. This system is employed quite successfully.

Its Use for Suspension Bridges.

The application of this material to suspension bridges was made in 1844 and in 1850 it was called to a still more important use, for electric transmission of intelligence, across rivers, seas and oceans. These two applications gave a greatly added value to the importance of wire rope and its manufacture, which now became the subject of a great number of patented processes.

Important improvements were about this time, introduced into the manufacture hy Mr. John A. Robeling, who produced, at his works at Trenton, N. J., the great cables, upon which he swung the suspension bridge at Niagara, and later those cables of still greater mammoth propositions, which now sustain the immense structure, which connects New York city with Brooklyn.

Propelling Street Cars.

One of the most recent applications of wire rope, is its use for propelling street cars, by what is called the "cable road system." This system was first conceived, and carried into practical use by our fellow citizen, A. S. Hallidie, etc.

Care and Durability.

A writer of wire ropes says:—"These wire ropes require great care and attention, and their durability depends in a great degree upon the care taken of them, aside from the actual work they have to do. In damp and heated places, the surface of the wires is protected hy suitable material such as tar, grease or special compounds. The winding on the reel and the varying strains has an effect in deteriorating also.

"The question of actual strength of rope in relation to working load and velocity is being investigated in Europe hy careful persons. It is not probable that the factors of safety adopted hy rope makers can he materially altered, still it would he interesting to determine separate factors for dead weight and velocity, and also for various sizes of ropes. As it is there is some margin, the working load being given by English manufacturers at from 1-8 to 1-10 of breaking strain, the difference being, presumably, for varying velocities. In France the Commission appointed to report on breakages of colliery ropes stated that the best firms only loaded their ropes to one-tenth of breaking strain; hut in small ropes of good wire, where each wire bad its own share of work, this was occasionally increased to one-sixth. In Belgium the factor of safety is one-seventh; in Germany one-eighth to one-ninth. The deterioration of ropes by wear is also an important question. The Commission just referred to state that new and old ropes vary in the proportion of 100 to 55, and that the difference in strength in individual wires, while not averaging more than 13 per cent., approach 75 per cent in worn rope. The same authorities state that in flat ropes the results are still more marked, as the wires will not, after use, stand one hend in the vice, which is partly attributed to the cutting action of the stitching wires. Now this question, which means the alteration in the nature of steel or iron wire, is a very important one, as it must regulate the life of a rope, although apparently uninjured."

The Manufacture of Wire Rope.

For making wire rope the very best material is selected, and the bars are rolled down at a welding heat to wire about one-fourth of an inch in diameter. This is then cleaned in warm water acidulated with a little oil of vitriol, and, being coated with a paste of rye flour, it is drawn through a succession of holes in a wire plate until it is reduced to the thickness of No. 9 wire, when it is annealed by heating from five to eight hours, and is then cleaned and drawn down again until it is of the required degree of fineness.

There are two kinds of wire rope manufactured. Ropes with nineteen wires to the strand are more pliable and are generally used for hoisting ropes. Those with twelve or seven wires to the straud are stiffer and are best adopted for guys, ferries and rigging. Wire ropes are made with six strands, with a center of hemp or wire, the former being more pliahle, and will wear better over small pulleys and drums. Wire rope is as pliable as new hemp rope of the same strength, and the greater the diameter of the sheaves, pulleys and drum, the longer the rope will last.

Although a few years ago wire ropes were generally made from the best of iron—Norway or Sweden being preferred—steel, in its wonderful progress, has largely pushed iron aside, especially wherever wire ropes are used for winding over a drum or pulley, or for hoisting, while the best of iron wire will hear a breaking strain of 100,000 pounds to the square inch of section.

Crucihle steel wire is made to-day capahle of resisting a strain of 250,000 pounds to the square inch. It will he thus seen what a range there is in the quality of wire rope, for while inferior iron wire will not stand over 70,000 pounds, the hest kind will run up to 110,000 pounds per square inch; and while inferior steel, such as Bessemer, will not take over 90,000 pounds to break it; carefully selected steel, made in small crucihles and able to take a temper at an ordinary red heat, will go as high as 250,000 pounds per square inch of section. Therefore it behooves those using wire ropes to know from whom they are buying and to know what they are buying.

Then, again, the kind of a rope required depends upon the conditions under which it is to work, and unless the person using the rope has given the matter some attention he should consult a reliable maker and get his advice. To order a *steel* wire rope means very little, because steel may be Bessemer, Siemen-Martin or crucible, and may be made from wire costing 6 cents per pound or from wire costing 16 cents.

In selecting a wire rope for hoisting, the first thing to know is what load you are going to lift, and the "load" must include the weight of the rope and the hucket or cage; then the size of pulley and drums it has to wind on. If the pulleys and drums are very large in proportion to the load to he lifted, a coarse rope, made from 6 strands of 7 wires each, can he used; otherwise, a flexible rope, which is usually made from 6 strands of 19 wires each, is to he preferred. And, as a rule, crucible steel wire that is capahle of bending over its own part, straighten out and repeat in the same spot, and that will stand a strain of 165,000 pounds per square inch, is the wire to have in the rope.

If your drums and pulleys are not made, and you have determined the size rope you want, then multiply the diameter of a wire in the rope hy 1,500. This will give you the diameter of the drum and pulley over which the rope bends in inches.

All ropes stretch hy tension and wear; winding rope will stretch from ½ to 1½ per cent before partiug. If they stretch much more than this it shows that the wire from which the rope was made is too soft.

Many makes form these ropes of wires of various sizes, but experience condemns this as a makeshift. The hest ropes are made from wires of uniform diameter and with a well-tarred, compact hemp, jute or manilla center.

All the wires in a wire rope should be equally strained, a tight wire among a lot of slack ones will soon hreak. Wire rope makers long ago found out that machines which made the strands and the rope at the same time could not he depended on to overcome this trouhle, and now the strauds are usually made first and afterwards laid up into ropes.

Ropes usually wear out through the abrasion of the exposed wires of the strands, and the section of the wire that originally was a true circle, when worn out, will show at the breaking point a circle with a segment sliced out. This has suggested making the outer wires with a flattened face exposed to the wear and various other modifications in order to prolong the life of the ropes.

However large the wire may be, the least wear on the outer surface weakens it considerably. At the same time, a straud of seven wires, *i. e.*, one wire surrounded by six, equal in size, is nearly perfect, each touchiug its neighbor, and also the center one, and if you lay around these seven wires another layer of twelve wires of equal size which just about covers them, you will have what is called a "flexible strand." For the same reason, six strands in a rope are hetter than four or five, as they make it rounder, and consequently the friction is hetter distributed.

Wire ropes are spliced without difficulty. They are also easily secured at the ends by a metallic socket variously fastened to them; and in similar methods, hook clevices, turn buckles, or other similar appendages are attached to the ends, and serve for facilitating the tightening of the ropes when they are employed for the standing rigging cables or for other purposes requiring occasional shortening or lengthening.

Table of Relative Strength.

The following table of the relative strength of the several sizes of wire and hemp rope, together with their proper working load and breaking strain is furnished from a reliable source, and it is arranged in a natural way so that anyone can select a rope to do a certain work, the initial column being the working load, the second column the breaking strength, then the sizes, weights of different ropes, and chain of equal strength. It will be noted that the sizes of wire ropes are all given in circumference. The diameter does not give the true size, and varies as you measure ou the projecting parts of the strand or the spaces between, whereas the circumference is iuvariable and being as 3 to 1, for the diameter is proportionally more accurate.

The first wire rope ever made on the Pacific coast was made by Mr. A. S. Hallidie in 1856 for Messrs. Brooks & Berry at the Bay State mine, on the American Bar of the middle fork of the American river. The wire was bright iron wire and was carbonized by Mr. Hallidie hy treating it in a charcoal pit for a number of days. The rope was 2,200 feet long, two and a half inches in circumferenee, and was made to take the place of a hemp rope seven inches circumference. The hemp ropes wore out every four and a half months, and the rope made by Mr. Hallidie (by machinery made by himself on the ground) in three pieces and by him spliced together, lasted two years. A year later Mr. Hallidie commenced the manufacture of wire rope in this city, and continued to do so until 1882, when his business was assumed by the California Wire Works, who are now carrying on the manufacture of wire ropes under his supervision. For many years the only place in the United States where flat wire ropes were made was in San Francisco, and the reputation of these ropes have extended all through the country. In a future number we will endeavor to give a history of wire, its development and present uses.

Mineral Deposits in Contra Costa.

Many of our readers will readily recall to mind, the excitement developed in this county some twenty years ago, by the supposed discovery of copper and quicksilver ore in the hills around the base of Mount Diablo, and the large amount of labor performed, and considerable sums of money expended in the fruitless endeavor to unearth either mineral in paying quantities. Plenty of specimens and small pockets were found of undoubted richness, but in no instance in sufficient quantity to be of remunerative value. The prospectors were men of little or no experience or scientific knowledge in the branch of mining required for properly carrying on the work, and it is not surprising that the wasteful and hap-hazard method of working resulted in failure, even if in some instances really valuable veins existed. Many people still adhere to the opinion that both copper and quicksilver, particularly the latter, could, with the added experience of twenty years hy mining experts, be found and mined with profit. We know that at least one considerable shipment of quicksilver was made to the city, when the company producing it quarreled among themselves, and the business terminated disastrously to all concerned. Subsequently, and within a few years, the late O. W. Eastou, gave considerable attention to the quicksilver mines of this county, and was so well convinced of their value, that after a thorough inspection, he sought to make arrangements for their development. Some delay occurred, and eventually his sickness and death ended it all. Some interest was revived in the matter by the report in the city a few days since, that a scientific and surveying party had been sent to this county by the Government to examine and report upon the metallurgical and mineral worth of the coal and quicksilver deposits. We have not heen able to verify the truth of the report, and are inclined to think some other locality is to have the benefit of the investigation. The value of the coal deposits needs no Government commission to determine, but it would be a great satisfaction if a thorough examination by competent parties would authoritatively determine either the probable value of the quicksilver deposits as a working proposition, or forever dispel the dreams of those who still fondly cling to the belief that untold wealth lies hidden in the gulches and canyons of old Mount Diablo.—*Contra Costa Gazette.*

MR. E. G. DENNISTON, of the San Francisco Plating Works, after making his yearly trip through the mining regions of California, gives it as his opinion, that Sierra county is, without doubt, the best mining county in the State.

worth to the market. The concentrator operates well, and employs 10 men, having a capacity of 60 tons per day crude ore, concentrating 4 to 8 tons in one. The mine employs 70 men. The figures showing averages in silver and lead for the different years exhibit the changes as depth is obtained. The richest ore is at the bottom, 350 feet on the dip or 200 feet below the surface. A new body of ore has just been struck, on which they have run 30 feet, taking out solid ore 8 inches thick.

The O. K.

William McMeen and R. C. Chambers have a good property in the O. K., being operated by 13 men, Thomas Gibbons being foreman.

The Bullion.

Col. Wall has 115 men employed on the Bullion mine and mill, and is sending off one carload of 165 ounce silver ore, carrying 65 per cent lead, per day. The mine is looking better than ever, and the mill does excellent work, concentrating as high as ten tons into one. The mill is run 12 hours per day, and turns out 3½ tons good ore. The workings of the mine are down 400 feet, the ledge being from two to eight feet, with pay ore five inches to two feet.

Point Lookout.

This property, belonging to Levy, Wexler and M. H. Lipman, is being operated by seven men under Mr. Ripto. The developments consist of a shaft down 15 feet, and a tunnel lately started. The ore averages 150 ounces, and the property promises well.

The Idahoan.

This great property is doing splendidly, working a force of 24 men in the mine. The mill is among the best in the country, and besides concentrating the second-class ore, breaks the first-class, ready for market. The mine has been prospected for 600 feet, getting to a great depth at the inner end of the level, and the quality of the ore improves with depth. Several other properties in this locality are looking well, and in time will become producers.

New River Mines.

There are at present in Eureka the following persons who have just returned from the New river mines: R. P. Stetson, John Black, Mr. Getchell, Mr. Robinson, of Oakland, Jas. McDonald and A. T. Smith. From the last named gentleman we glean the following facts: Mr. Smith was eight days at the mines. He was at the Mountain Boomer claim the day the new bonanza was struck. One of the partners scraped up a double handful of dirt from the decomposed ledge and washed it in a pan, and the result showed $10 in yellow gold. The clean-up this month will return not less than $10,000, and that, too, with only one arastra working three-fourths of a ton of rock per day. The five-stamp mill purchased by Mr. Boles for the American Boy mine arrived at its destination on Thursday. It will be made ready as fast as possible for active work, which will commence in August. The prospect of this mine is very flattering for good results. The whole country is being prospected, and every day ledges are located which show encouraging prospects. The great difficulty at present lies in the fact that those holding claims have no money to develop them, and they want a fortune when they sell out. Consequently little or no work is being done outside of what is necessary to hold claims. As soon as capital takes hold a number of fine claims will be opened up. These mines are situated about 85 miles from Eureka. Some 60 men are now in the camp. No regular mining district has been formed, and in consequence there is no little dispute relative to lines and boundaries, and it is feared serious trouble will follow the loose manner in which claims are designated. The mines lie high upon the Perry Creek Buttes. The snow on the north sides of the hills is yet seven feet deep.—*Humboldt Standard.*

New Ore Mill.—Geo. W. Chick, an expert mining operator, appreciating the necessity of a mining mill for the reduction of ores, has a mill now in operation at Campbell & Co.'s foundry at the corner of First and Main streets. The mill, as well as the rock-breaker, is a Portland invention, and as a representative of this paper was permitted to inspect its working, we can truly say that for its size it surpasses anything of the kind on the coast. Mr. Salmon of the ice works is the inventor of the mill and has spent years of study in bringing it to perfection. Its capacity is ten tons daily, and Mr. Chick informs us that should the demand be larger he will run as many as is needed. Mr. Jones a partner in the foundry, is the inventor of the rock-breaker, pronounced by experts to be perfection itself. A six-horse power engine runs both mill and crusher, the steam being furnished by the foundry. Mr. P. Rigney, the silver plater, on Morrison street, plated the riffles with quicksilver, an idea originating with Mr. Chick. This industry fills a want long needed in Portland, miners heretofore being obliged to send their ores to San Francisco. It is to be hoped that Mr. Chick will be so encouraged as to enter largely into the business. The rock now being reduced came from southern Oregon, from a mine owned by Mr. Chick and partners.—*Portland Standard.*

Useful Information.

A Cork Grinding Machine.

The new material "linoleum" required the invention of a new machine for pulverizing the cork, of which it is chiefly made. This machine is described by the *Manufacturer and Builder* as follows: The machine consists of a series of cast steel disks (18 or 20 in number), with serrated edges like a saw. These disks are alternately seven and nine inches in diameter, and one-half inch in thickness, and are mounted in close contact with each other, side by side upon a shaft, to which they are keyed. Closely adjoining, and fitting in between these disks, with just space enough left between their edges and the periphery of the disks to permit of the feeding of the cork to be reduced, are a series of steel plates with similar serrated eggs. These plates are held firmly in juxtaposition by bolts, which serve also to attach them firmly to the frame of the machine. The toothed disks are rotated at about 180 revolutions per minute, and the cork is reduced by the machine to the size of a pea. These fragments are further reduced to powder by ordinary horizontal mills resembling those used for grinding corn. From the millstones the cork powder is carried by a screw elevator to a sieve, by which the coarse and fine fragments are separated into several grades for the production of several qualities of linoleum. If any of the material is too coarse, it is returned to the mill. The very fine powder is treated with the suitable mixture of oxidized linseed oil, and after the product is finished, makes a floor cloth that is susceptible of a very high finish; the coarser material, on the other hand, makes a more elastic linoleum.

Tanning Linen.—A Belgian inventor, M. Piron, has invented a method of rendering cellulose tissues impermeable and very durable, without injuring their flexibility, and without much increasing their weight. By examining the bandages of the Egyptian mummies he inferred that the best preservatives would be found in the vegetable kingdom and he has given preference to the green tar of birch bark, which furnishes the perfume of Russia leather. The tar forms, with alcohol, a solution of great fluidity; but when once dried it becomes resinous and resists the solvent power of alcohol. It can be combined with the most brilliant colors. These qualities enable it to penetrate the capillary vessels of tissues, covering them with a varnish of great elasticity, which resists the corrosive action of acids, sea water and changes of temperature. The density is very small, so that the tissues are made impermeable with a slight increase of weight. The prepared stuffs can be folded without scaling. The aromatic odor drives away insects. Microscopic vegetation cannot grow, because neither air nor water can penetrate into the interior of the fibres. The invention can be applied to all vegetable tissues, such as sail cloths, cordage, awnings, curtains, &c.

How Glass Beads are Made.—Glass beads are made by drawing the glass into small tubes, and breaking the tubes into suitable lengths for forming the beads. The material is then placed upon a flat plate like a frying pan, which is heated just hot enough to allow the glass to draw the sharp edges into a round; at the same time the plate or pan is gently vibrated, so as to prevent cohesion of the softened beads. A cylinder is also used something like a coffee roaster on a small scale. The cylinder can be made of cast iron quite thin. Faceted beads are made by pressing the glass in small moulds that have sharp edges and a punch, so that the eye is punched and the bead faceted at one operation, using small rods of glass heated in a muffle furnace. The manufacture is mostly confined to Birmingham, in England, and Venice.

Wood Carpeting.—What is described as a wood carpet has lately been patented by Herren Kuny & Marx, of Munich. It consists of prepared wood-fibre, felted by the aid of oxidized linseed-oil and coloring matter on to a jute fabric, the back of which latter is covered with a coat of varnish. The material thus obtained is said to have a pleasing appearance, can be easily cleaned and repaired, is warm, noiseless, and can be taken up like carpets and quickly relaid on a change of residence. The surface can be produced either flat or with designs in very slight relief. The coloring is homogeneous throughout. As will be seen from the above description, the wood carpet is in some respects not unlike our linoleum. The price is said to be, however, much lower, while durability is also claimed for the new material.—*London Furniture Gazette.*

Phosphorous Paste.—A phosphorous paste that will keep a long time may be made by the following process: Shake nine parts of phosphorus in ninety parts of warm syrup, and pour the still warm mixture into a pan in which ninety parts of wheat flour have been previously put. Agitate rapidly, and add sixty parts ivory black, sixty parts water, and one hundred and twenty lard.

Whalebone Brushes.—In buying a brush, the buyer is often offered one for, say fifty cents, and another to the unpractical eye, exactly like the first, but for which he is charged one dollar. Now, where is the difference? The New York *Sun* answers as follows: "One is made from real bristles, and the other from whalebone. They look just alike, but, of course, the bristles are better. Whalebone has been used to make brushes for some time. It is divided up into shreds by machinery. It doesn't make a bad brush."

To Destroy Red Ants.—Grease a plate with lard, and set it where ants congregate; place a few bits of wood so that the ants can climb on the plate easily; they will forsake any food for lard; when the plate is well covered with them, turn it over a hot fire of coals; they will drop into the fire, and you can then reset the plate for another catch. A few repetitions will clean them out.

How to Wash Old Flannels.—When flannel has become yellowed by age, in order to whiten it, dissolve a pound and a half of soap in six gallons of water, and add to it one tablespoonful of spirits of ammonia. Place the flannel in the water, stir it rapidly around for a short time, and rinse it up and down, then take it out and rinse it in pure water.

Golden Streets.—The well-known French electrician, Mr. Louis Maiche, has found there is gold to be obtained from the quartz, with which the streets of Paris are paved. He has obtained small quantities of gold from the sentinel, but not in sufficient quantity to warrant the tearing up of the road beds for mining purposes.

Oil-cloth may be improved in appearance by rubbing it with a mixture of one-half ounce of beeswax in a saucerful of turpentine. After being applied it must be well rubbed with a dry cloth, otherwise the floor will be quite slippery.

Carriages Made from Paper Pulp.—A Dresden house makes children's carriages out of pulp. Watch cases are made from black celluloid. Japanese papers for clearing the skin are also in the market.

On the Pennsylvania Railway the average consumption of fuel for passenger trains is 56 pounds per train mile.

Good Health.

Heart Disease.

There are probably many among those who will read this article, who believe themselves victims of heart disease. If a repetition of the statement we have repeatedly made, that examinations after death have shown that only one person in twenty of those who were supposed to have died of heart disease, had any disease whatever of that organ, will serve to allay the fears of a single *malade imaginaire*, we shall feel amply rewarded for the trouble of writing it. When we consider that a large portion of the adult population of this country suffers more or less from dyspepsia, and that this disease simulates heart trouble so closely as in many cases to require a careful examination by a physician to determine the question, we can not wonder at the supposed prevalence of a disease that is comparatively rare. But still there are cases of real heart disease, that with proper care cause no marked inconvenience or suffering, and where the patients live to old age or die of other maladies. Again, there are victims of the disease to whom death comes as a welcome relief.

Sometimes an hereditary tendency to the malady exists, as in consumption and other diseases; but in the light of medical knowledge at the present time it could hardly be regarded as a fatality. Careful living usually overcomes such tendencies. A prominent man doing business in New York, but residing in the suburbs, having been delayed in his office a few minutes longer than usual, ran in order to be in time for his regular train; the following day he died of heart disease. Had he given the matter a thought, it probably would have occurred to him that the effect might very naturally follow the cause. A person past middle age, and unaccustomed to such vigorous exercise, can not hurry the circulation of the blood and the respiration with impunity.

Nothing is more dangerous than irregular and violent exercise for persons unaccustomed to it. Students and others of sedentary habits who exercise in gymnasiums, can hardly restrain themselves from efforts to excel; and thus bring injuries upon themselves that impair health and shorten life. As generally conducted, gymnasiums are responsible for a great amount of evil. If any special muscles are unduly developed, the development is at the expense of other muscles, and thus the equilibrium between the muscles of the body is deranged or destroyed. The heart is a muscle, and its development is a *disease* to which athletes and gymnasts are peculiarly liable.

We do not wish to be understood as saying that heart disease never comes from dyspepsia. Blood is made of food taken into the stomach. If not properly digested, the quality of the blood is poor, the circulation is impaired, and the action of the heart is irregular. This would lead to disease, eventually, did not the stomach rebel and positively enforce better treatment, and that is the reason so few dyspeptics suffer from actual disease of the heart; although there may be great functional disturbance. It is a trite saying "that a gentleman is never in a hurry." He is supposed to do all things with dignity and deliberation. He never runs to catch a train, or jumps over the ferry-boat gates to get ashore first. He is never in haste to reach the dining-room at the first tap of the bell, nor in a hurry to leave when he gets there. If he were generally adopted as a model, there would be fewer cases of dyspepsia. —*Journal of Health.*

How Much to Eat.—It is utterly impossible to prescribe the quantity of food appropriate to a person; he must ascertain that for himself. This is not very difficult, for if one eat lightly, say at breakfast, and note the time he can go without feeling a want of more food, he will, after a few experiments, ascertain the amount of food requisite for a day. Let one take some bread and milk, or porridge or what not, a moderate quantity, at breakfast, and it will serve him probably for three or four hours. Of course the time during which he will feel no special desire for refreshing the stomach will be dependent upon the work in which he is engaged, a given amount of food going further in manual exertion than in brain work. When it is ascertained how much is suitable, care should be taken not to eat more than that. It is better to reduce the quantity than to add to it; it is better to leave the table with a sense of want than with the sense of repletion. Rest is as essential to the stomach and other organs of digestion and assimilation as it is to the limbs. Overwork of the stomach induces dyspepsia, whereas an insufficient amount for the needs of the body will not tell very soon upon the constitution; that is to say, if one eats his daily meals regularly, but doesn't eat quite enough at a time, nature will more readily adapt herself to the shortened allowance than she can to a trifling excess of the proper regimen. *Science of Health.*

Overcrowding the Principal Cause of Diphtheria.—Dr. T. J. Hutton has, within the past three years, treated 64 cases of diphtheria, occurring in Minnesota, and says in the *Medical Record:* These cases were all in comparatively new houses, in a belt of country where white men never lived before, so that the soil contained no sewage and had no accumulation of surface filth. Diphtheria had never before been there, and could not have been brought by visitors; it was of a malignant type, and some families lost five or six members each. All of the cases were included in 17 rural outbreaks, 3 of which were in summer and 14 in winter, and each house attacked was small and greatly crowded. Many of the winter outbreaks happened when the temperature was 30° to 40° F. below zero, which would have been death to all ordinary surface germs, and in one instance the thermometer registered 60 below, when the surface of the earth and all bodies of water were frozen solid.

The Bite of a Mad Dog: not Always Fatal.—The bite of a mad dog, it would appear, is not so fatal as is generally supposed. A report upon the subject for the Department of the Seine, issued by the Paris Prefecture of Police for the past three years, shows that of 156 persons bitten by rabid dogs in 1881, 80 died; in 1882, 9 out of 67 bitten died; and in 1883, 5 only out of 45. With regard to the treatment of the bite of a rabid animal, the experience of the French doctors shows that the only remedy which can be depended upon to destroy the virus is the prompt application to the wound of cautery by red-hot iron. Twenty persons died of hydrophobia in the Department of the Seine in 1881, 9 in 1882, and 4 in 1883, as far as the official returns show. The decreasing number of deaths from this cause is attributed to the stricter measures adopted with regard to owner-less dogs.

The Pulse of Smokers.—From experiments made upon the pulse and temperature as affected by smoking, it has been found that the rate of both is increased. Let the average temperature of non-smokers be represented by 1,000, then that of moderate smokers would be 1,008; and while the heart of the former class was making 1,000 beats, in the latter there would be 1,180 in the same space of time. This quickening of the action of the heart is considered a dangerous symptom.

Covering the Head.—In a paper read before the Edinburgh Health Society, Dr. Almond referred to the custom of having the head covered out of doors and uncovered within doors as very injurious, on account of its making people so sensitive to draughts of air as to cause them to take cold. Boys, he said, who went bare-headed out of doors could stand a greater amount of ventilation in school rooms and sleeping rooms than those who wore head coverings.

Crushed Ice for Burns.—The value of crushed ice as a dressing for burns and scalds, first pointed out by Sir James Earle, is confirmed by Dr. Richardson (*Asclepiad*, 164). The ice, after being reduced by crushing or scraping to a fine state of division as dry as possible, is mixed with fresh lard into a paste, which is placed in a thin cambric bag and laid upon the burn. This is said to banish all pain until the mixture has so far melted that a fresh dressing is necessary.

MINING SUMMARY.

The following is mostly condensed from journals published in the interior, in proximity to the mines mentioned.

CALIFORNIA.

Amador.

CANNON BALL MILL.—Amador *Dispatch*, August 9: Mr. I. N. DeWitt has got his new cannon ball quartz mill about ready to commence crushing rock on his mine in Murphy's gulch. The rock looks well and is in a good locality. Mr. J. W. Petty showed us several pieces of very rich rock taken from his mine near Slabtown last week. The precious metal was visible to the naked eye in very encouraging quantities.

El Dorado.

CRUSHING.—Georgetown *Gazette*, August 9: The Revenge quartz mill near Greenwood is now engaged in crushing a lot of 100 tons of ore from the Bell mine in Garden Valley district. There is no doubt about this ore paying handsomely, as we understand Supt. Dixon is crushing the rock for one half he takes out of it. Work of development in the Revenge continues steadily, and another crushing will be made after the Bell ore is crushed. We hear of others who are about to have ore tested by this mill.

Inyo.

FREEBORN CANYON MILL.—Inyo *Independent*, August 8: Some twelve or fourteen men arrived in town during the week en route for Freeborn Canyon, to work for M. G. Nixon on the mines just purchased by the latter. The number of teams and pack mules that were employed to take the supplies over lead us to think Mr. Nixon means business, and we have no doubt that he will soon be repaid for his immense outlay, as there is considerable ore now ready to be packed and milled.

POLITA MINE.—Tom Luther was in town on Tuesday last, and reported everything working smoothly at the Hawley mill, which is being put in good shape. By next Monday the side track will be finished to the mill, which will start up at once. Messrs. Irwin & Co. intend to make the Polita mine a success, and are the right men in the right place. We hear that George Storey has arrived at Bishop Creek to take charge of the mill.

Modoc.

HAYDEN HILL.—Cor. Adin *Argus*: A. P. Ritchie has disposed of his interest in the "Don't Care" mine. The "Juniper" will have to look to her "laurels," as another mine equals, if not surpasses, her in richness. G. F. Hoes has had his new mill in operation, but owing to some breakage in machinery has not yet proved its success. He has had the old "Brush Hill" mill again put in operation, to assist in the reduction of his large quantity of ore. Preston & Co. have their new arastra completed and in operation. It is said to work well.

Mono.

HOMER DISTRICT.—*Mining Index*, August 9: The Gorilla mine has been steadily improving in appearance and value for the past four or five weeks, until now it stands as one of the best mines in the district. The only drawback is the lack of facilities for the reduction of ore in quantity, the capacity of the present reduction works being but five or six tons per day. One of Hill's Triumph ore mills, with a capacity of twelve tons per day, has been ordered, and will be shipped next week. This will help out; but, with a few additional men, the mine could furnish fifty to sixty tons of ore per day for an indefinite period of time. The Bryant mine continues to turn out very rich ore, with an abundance "of the same sort" still in sight, and from this high-grade ore the little two-stamp Butterfield mill is turning out almost as much bullion weekly as more pretentious reduction works. As yet we are not at liberty to state the yield per ton, nor the aggregate yield for the season or per month, but hope soon to get permission to give both, as the former would seem almost incredible without the latter. The May Lundy is running full-handed, and the bullion shipments are regular and of the usual value. The new tunnel will tap the vein in the Lake View within a short time, when a rich development may be expected. The Hearne arastra has been started up on ore from the Clifton mine, and those familiar with the ore and the past history of the mine confidently expect a handsome yield.

JORDAN DISTRICT.—The Virginia Creek Hydraulic M. Co. is sluicing out placer gold by the pound from its diggings near old Monoville. This is undoubtedly the richest hydraulic diggings ever opened in the State. The present breast is very broad, the pay gravel being about five ft in thickness, with from fifteen to twenty inches next the bedrock that is literally "lousy" with coarse gold. Water is abundant, and when the bedrock is cleared of gravel and earth it is found to be yellow with gold. The whole width of the tunnel being driven in the ledge in the Olsen claim, at the head of Callihan creek, is still in fine ore, giving assays of about $150 in gold and from $3 to $4 in silver per ton. Near by is the Olsen No. 2, commonly called the "Silver Ledge," with a low-grade ore vein fully eight ft in thickness, gold and silver being about equally divided in value. Nothing yet is definitely known as to the intentions of the Detroit Copper Company.

TIOGA DISTRICT.—Considerable activity now prevails in the south end of Tioga district. R. A. Sawyer has resumed work on the Mary B, the Yosemite and the Deer Lodge, on Mount Gibbs plateau, and George M. Lee is working the Silver Prince, the first north extension of the Ella Bloss, on the southern slope of the same mountain, near the head of Bloody canyon, and the Garibaldi, on the plateau. Gus Cordes is working the Dutchman, on the southwest slope of Mount Gibbs, and has a fine prospect. Sonora parties have men engaged in working claims on Tioga Hill, on portions of the Sheepherder and other lodes. Work has not yet been resumed in the Great Sierra tunnel, but the wagon road is being put in order, and other preparations made which clearly point to the resumption of work at an early day. Orlando Fuller and Andrew Thompson are still sinking in the Lucky Friday.

PRESCOTT DISTRICT.—L. W. DeChambeau and Wm. D. Ray have commenced work on their location on the big ledge near the Mount Lyell glacier. Lord Horace Pullen went over to Mount Lyell during the week to look after his Lucky Saturday claim. Fred Schwartz is driving a short tunnel to strike the ledge in the Big Bonanza at a depth of fifty ft, being encouraged by assays of $375 (silver) from the croppings. Schwartz and Tommy Albright are also working the Hardscrabble, on the Queen of the West lode, east of Mount Lyell. Tom Jackson and Col. Burroughs are working some claims in Parker canyon, and are daily expecting the arrival of some Arizona capitalists.

Nevada.

RIVER MINING.—Grass Valley *Union*, August 8: River mining is not altogether a thing of the past, but the operations are almost entirely conducted by Chinese companies, of which there are a number engaged this season on the Yubas. And from the fact that some of these companies have been working the same locations for several years past the presumption is that they have ground that pays for the expense and labor of mining the streams and putting in the requisite flumes and dams.

THE MCCUTCHAN MINE.—Nevada *Transcript*, August 8: Robert Curnow and John Spry have leased the McCutchan mine on Canada Hill for one year. Work will be immediately commenced, and after clearing out the drain tunnel a crushing of rock will be taken out. Mr. Curnow, who had charge of the mine heretofore, is confident that the mine can be made to pay well.

OPENING THE MILLER LEDGE.—The Thurston brothers, who have been mining at Cherokee recently, will this week begin the systematic development of the Miller ledge, situated below the Baltic, which latter is not far from Graniteville. They will take up there, from Cherokee, their Cannon Ball quartz mill to crush the ore, of which they already have out about 250 tons. A small lot of the average quartz was milled lately and paid $18 a ton. The Miller ledge was partially opened up by Captain Miller, when he died, and it has, since his death and until now, remained idle. Those acquainted with its history say it is a very promising claim.

DISPLAY OF BULLION.—Thursday's and Yesterday's bullion from neighboring mines, amounting in all to about $15,000, were on exhibition at the Citizen's Bank yesterday afternoon, attracting the attention of a good many of the people from abroad who were in town. One bar worth $9,000 was especially admired.

A BIG LOT OF GOLD.—So many pounds of gold bars, that it required the united strength of two men to carry them, were sent to San Francisco yesterday afternoon through Wells, Fargo & Co.'s office at this city. Some of that wealth was from quartz and some of it from gravel (drift, of course) mines. It is imperishable, unlike the products of the valley ranchers and manufacturers who are trying to stop our people from taking more of it out the ground, but can't. Nevada county can be easily made to yield enough out of it in one year to buy every acre of slickens land from the summit to the sea.

Placer.

LUCKY S.—Greenville *Bulletin*, August 6: Mr. John Hardgrave of Taylorville was in town on Monday concluding a contract with the Greenville Iron Works for a quartz mill to be placed on the Lucky S mine. Work on the mill will commence immediately and will be pushed till the completion of the work. G. W. Aylesworth of this place will have charge of the carpentering to be done. Only five stamps will be put in at present but the mill will be so constructed as to enable the company to add five when they wish to do so. The ditch has been completed and the water turned in. There are about 100 inches of water. The outlook is good for a successful run. The New York mill has been leased by T. F. Emmons for the owners of the Central Ledge, which is on ground adjoining the New York mine. The prospects at the Forest King are quite good.

Plumas.

HOPKINS CREEK QUARTZ.—Plumas *National*, August 9: On Monday last we received a call from Cap Donahue and Mr. McDaniel, gentlemen who are interested in the rich quartz mines recently discovered on Hopkins and Poormans creek. The Captain had some fine specimens of rock, and also some seven or eight ounces of almost pure gold which were taken from the American claim last week. Some of the pieces weighed an ounce or two. He tells us that two men at work in the ledge picked up over 14 ounces of this gold last week. The ledge is at least 30 ft in width, fine looking quartz, and the owners are sanguine that they have one of the very best mines in the country. A new location on Poormans creek, named the Walkeresa, is thought to be a splendid ledge. It is a 12-foot vein. The American Co. sent a specimen for the cabinet which, though not large, is a beauty and shows well. The gentlemen tell us that many locations have been made and the indications are that a very lively and flourishing quartz camp will be in full blast there in a short time. The owners of the American mine are well able to make all necessary improvements, and it is thought that a mill will soon be put up. Hopkins and Poormans creeks were famously rich in the years gone by, and the ledges now being opened undoubtedly furnished the gold which made them so.

ANOTHER QUARTZ MILL.—Sierra *Leader*: J. C. Black, a prominent attorney of San Jose, passed through the valley Wednesday. He went to Mohawk where, with his brother and other parties, he is interested in some mining claims. He states that it is the intention of the company to erect a mill on the ground at once.

San Bernardino.

THE BONANZA KING.—Cor. Calico *Print*, August 8: This camp is one of the best and most productive of any in this section, and I will give you an item correct, as taken from the records of the Co. The Bonanza King Consolidated Mining Co's mill, a ten-stamp dry crusher, has now run on ore, from the mines of the Bonanza King Con. Mining Co. for a period of seventeen months. During that time there was crushed and reduced at the mill 12195 tons yielding in bullion $902,520. The mine continues to look well throughout; the yield at present is about the same. The Company shipped July 24th $8,000, to-day $11,150, and will forward on the 10th about $13,000 more. The battery assays average from $70 to $90. The percentage saved from the fire assay by amalgamation, without roasting, is very high, from 85 to 93 per cent. This is a showing that any company might be proud of. The other mining interests in and about the camp are doing well and promise to make favorable showings for themselves ere long.

Siskiyou.

PICK AND PAN.—Yreka *Union*, August 7: Mr. Geo. C. Spooner, an expert miner who, in company with others, have been operating the Summerville hydraulic claim, on the south fork of Salmon, informs us that the mine has yielded satisfactory returns for the short length of time the mine was worked. The claim is said to be the best equipped in the northern country, but the water supply is not sufficient to admit of long runs. The Co. will probably construct new ditches to tap the south fork of Salmon river and a branch known as Little South Fork, which will give an abundance of water for all purposes. A new saw mill will soon be erected to take the place of the one destroyed by fire last fall. Mr. R. H. Campbell, of Quartz valley, has finished cleaning up, and the yield fell but little short of $60,000. In the McConnell claim on the Klamath river rich pay is being realized; the electric lights have been attached to a new dynamo generator, and are now working satisfactorily. Of the many mines that have closed down for the season only one is reported as not paying a profit over running expenses. Mr. Pyle paid a visit to his mine on Deadwood, yesterday, and appears well satisfied with the outlook. He brought in several pieces of very rich rock. The Crooker boys have started their arastra on Deadwood.

Shasta.

ROUND MOUNTAIN.—Cor. Shasta *Union*, August 9: Our mining interests in this district are at present almost entirely neglected; some little prospecting is going on. Mr. Morley has a good gold prospect in his claim, and has done considerable tunnel and shaft work. At the Afterthought everything looks dreary, no one at the mine or mill to take care of property that has cost a large amount of money to put in shape, which was abandoned last September. Parties passing by will appropriate and pack off anything that they think they need, and so article after article has disappeared, and many of considerable value. The main building is of itself a fine structure for a ten stamp mill. Mr. Stewart, the last Superintendent of the Afterthought, came nearer making the mine pay than anyone before him, and says that with the outlay of a few thousand dollars in erecting a copper mill, that he can soon make the claim pay dividends, for he says that it is more of a copper mine than anything else, and to work for the copper first and then for other valuables, will make good returns, but to work all together the cost is too great.

Trinity.

RICH QUARTZ.—Trinity *Journal*, August 9: John Clifford came up from New River this week and exhibits the richest quartz specimens ever found in this county. The prospects in New River District are said to be excellent, there being 15 or 20 ledges.

DEADWOOD is rather dry now, as the water supply is too limited for running the arastras. Most of the mines are being worked and developed, and reports say that good rock is being taken out.

ALL READY.—We erred in saying that McDonald & Franck had started their five-stamp mill on Deadwood. The mill, however, was within a day or two of completion, and we were informed that they would probably make a trial on Tuesday of this week. In all its appointments the mill is most complete and of the best, and judging by the quality of rock on the platform, will produce more than any mill or other crusher in the county.

PAID WELL.—We met Supt. John Yule, of the Buckeye Company, for only a few moments on Monday last, but long enough to learn that the season's work had been successful, and that he was highly elated over results. The immense body of auriferous gravel owned by this company should be made to yield millions of dollars, and will do so if worked on an extensive scale.

NO MORE WORK.—Mr. E. M. Benjamin, Superintendent of the Hayes Red Hill Gold Mining operations, writes us that he now has 72 men employed on the works, and does not desire to employ any more.

R. N. DAVIDSON is doing good work with his Cannon Ball Mill on Deadwood, running on very hard rock from the Vermont Mine. We learn that this rock is paying very well.

NEVADA.

Washoe District.

HALE AND NORCROSS.—*Enterprise*, August 9: The west crosscut on the 2800 level was yesterday out 14 feet. It has been all the way in quartz, which shows bunches of ore. They have yet some distance to go to reach the point where the principal deposit of ore should be found. Regular shipments of about 500 tons of ore continue to be made from the the ore body on the 300 level. Since last report additional returns of $12,000 have been received on July account. Last week, it will be remembered, there was an additional return of 4,000 ounces of crude bullion.

GOULD AND CURRY.—The joint Best and Belcher west drift on the 2500 level is now being advanced at the rate of about 60 feet per week. The north drift from the 825 station of the Bonner shaft is making good progress in ground that works well. When out a proper distance, crosscuts will be run from this drift to explore 2 large area of ground that has not heretofore been worked.

SIERRA NEVADA.—West crosscut No. 3 on the 3100 level is showing a strong streak of ore that assays about $20 per ton. This ore deposit dips to the east at an angle of forty-five degrees, and now fills the face of the crosscut. On the 3200 level the joint Ophir, Mexican and Union Consolidated winze has been sunk and timbered eight feet.

CHOLLAR.—The main south drift on the 2800 level, which has been advanced at the rate of over 60 feet per week, is now making less progress, owing to a recent flow of hot water from the face. The material is now largely composed of quartz.

OPHIR.—On the 250 level some paying ore is still being taken from the fillings of old drifts. On the 500 level the west drift is making about 60 feet per week.

ALTA.—The west drift on the 2150 level is being advanced at the rate of over 70 feet a week, and is in very favorable ground. The water is draining out considerably in the east drift on this level.

YELLOW JACKET.—A good deal of low-grade ore is still being extracted and sent to the mills. While the ore already opened up is being extracted, a considerable amount of work is doing in the way of running exploring drifts.

ANDES.—The winze is fast nearing the vein, where it is expected some paying ore will be found. The north drift is in quartz showing occasional bunches of low-grade ore.

CROWN POINT.—About the usual quantity and quality of ore is being mined and sent to the mills. A considerable amount of ore is being opened up by the prospecting drifts.

ALPHA.—The north drift is being advanced in quartz of a promising character, which yields low assays. The east crosscut has passed into porphyry.

UTAH.—The southeast drift on the 1950 level has made the usual progress during the week, and is still in vein porphyry with seams of clay.

CONSOLIDATED VIRGINIA.—The diamond drill shows much wet ground on the 2900 level. The water is very hot, and drifting on the level will be slow work.

Esmeralda District.

HUMBOLDT MINE.—Bodie *Free Press*, August 6: A private letter states that Gov. Blasdel let the contract on Monday last for sinking the new double compartment shaft on the Humboldt mine at Aurora. It will be sunk 100 feet at $10 per foot, to be completed in 30 days and will be used for the new hoisting works. These figures are as reported on the street. Six men started in on the work yesterday.

Arabia District.

STARTED UP.—Cor. *Silver State*, August 8: Superintendent Williams, of the Bernice mill, arrived from Bernice Wednesday. He says the mill had been thoroughly repaired, and was started up on the 15th of July. A partial clean-up was made after a run of 14 days with five stamps, and the result was $5,000 worth of bullion. There are fifty men at work in the camp, and the number will be doubled before snow flies. The miners are looking well, and there are large quantities of ore in sight. Application has been made to Wells, Fargo & Co. to establish an express office in the place.

Columbia District.

POLARIS.—Tuscarora *Times-Review*, August 8: Active operations are being prosecuted at the Polaris mine at Columbia. A new whim has been erected which is working finely and which is abundantly able to do all of the hoisting for a hundred feet below the present depth of the incline. A new track has been laid to the bottom of the incline, which is down 130 feet. Sinking and drifting, both in ore, have been resumed and in a short time there will be a considerable amount on the dump ready to be taken to the mill. The ledge in the face of the drift at the 100-foot level is fully six feet in width and the entire body will average sixty dollars to the ton. The incline will be sunk to the depth of 200 feet when another level will be opened out. A considerable addition will be made to the working force in the course of a few days.

Highland District.

MENDHA MINE.—Pioche *Record*, August 8: This mine, at Highland, continues to hold out its own. The ore body on the 115-foot level continues to hold out strong, pitching to the southwest. The ore in the drift, at the face was eight feet wide. The bottom of the drift at this point, was all ore. It had been sunk on for six feet, and continued all in ore. There is now being run a drift from the shaft on the 160-foot level to tap the ore going down. The drift is now in 130 feet, and foreman McQuaig expects to tap the ore in about 40 feet further. Iron stains have just commenced coming in the face of the drift. The usual amount of ore is being extracted from this mine daily and shipped to the furnace, and the grade of the ore holds about the same as has been published before.

Columbus District.

MOUNT DIABLO.—*True Fissure*, August 9: The east drift on the fifth level has been driven 12 ft during the week, and has now 71 ft to go to reach the incline. The incline is now 257 ft below the third level, and has 12 ft more to go to be as low as the fifth level. The east drift on the fourth level is in 101 ft, and a drift has been started west from winze No. 3 to meet this drift. There are 115 ft yet to drive. The west drift on the fourth level has advanced 8 ft during the week, and the face shows a little low-grade ore. The west intermediate, between the second and third levels, is in 138 ft, and shows a little low-grade ore. In the intermediate, between the first and second levels, the east drift shows a narrow seam of $60 ore. A small amount of ore of fair grade is being taken from the workings above the Mount Diablo adit.

Pennsylvania District.

NO BENEFIT.—Pioche *Record*, August 8: The chances are that the Klingersmith mining property of Pennsylvania district will never change hands. The owners want too big a price for the property. No matter what amount will be offered for the mine, always some one of the owners holds off with the hope that he may get four bits more for his interest. No matter how good a mine may be, if it lies idle for years, as this property has done, it is of no benefit to its owners, nor the locality that it is in.

Osceola District.

VERY QUIET.—Pioche *Record*, August 8: E. Howell, after a ten days' trip, has just returned from Osceola, and reports things as very quiet over in that section, the water having nearly given out and but little doing on the placers. The 20-stamp mill of the Osceola Company is running on ore from the Monroe & Lytton and doing good work, taking out considerable gold bullion. Mr. Howell's trip was for the purpose of examining the Verde mine for San Francisco parties, the property of Akie and Felsenthal. He speaks quite favorably of it and was well pleased with the large amount of pay rock in sight, the ledge being stripped for 250 ft or more and showing up a strong four-foot vein of ore the entire distance. He puts the amount in sight at $20,000, and thinks when depth is attained will prove a valuable mine. The owners are taking out ore for a crushing at the Osceola mill, and will make a shipment next week of 60 tons, which will go a long ways in showing up the true merit of the property.

Taylor District.

PROSPEROUS.—Cor. Eureka *Sentinel*, August 9: Our mines are yielding constantly their ordinary quantity of ore. The quartz teams are going continuously and quiet prosperity reigns in our little camp.

Amador District.

PRODUCING GOOD ORE.—*Silver Star*, August 11: Nick Frayer who arrived yesterday from the Paradise mines, gives glowing accounts of the outlook in the district. He says every mine that is being worked looks well. The Paradise Valley is taking out extraordinarily rich ore in the Wild Goose. The Bullion, which has been leased by Harry Warren, is showing up rich ore, and considerable of it. The Julia mine, owned by Henderson, Patterson and Myrick Carrel, is developing finely. There are two feet of rich ore in the vein. Vance Nelson has purchased an interest in the Rattler, and he and Mr. Brannan, one of the old owners of the mine, are taking out good ore. They have cut the lead in the tunnel at the depth of about 100 feet and find the vein very rich at that depth. There are ten or twelve men at work on the foundation of the Live Yankee mill, and two millwrights are putting in the machinery. The prospects throughout the district are first-class. The Juha, which is a new discovery, shows as well as any prospect ever found in the district. Good judges say the ore which is being taken out of the lead will work at least $500 per ton.

Belmont District.

BELMONT.—*Courier*, August 9: The 200 foot level south is now out from station 406 feet in very hard rock; just struck in face a fine streak of ore. Ledge in stope No. 1 is 5 feet thick, mostly good ore. Stopes 2, 3 and 4 unchanged. Under stopes 1 and 2 holding their width and yielding fine ore, black metal and chlorides. Battery and furnaces running splendidly. Average chlorinations, 95 per cent. Will commence leaching to-morrow. Everything about mine and mill in excellent conditon.

ARIZONA.

CONCENTRATOR.—Prescott *Courier*, August 9: Edward M. Clark has a good mill, concentrator, etc., on Groom Creek, and announces his readiness to work ores for the miners. B. T. Riggs, who recently visited the Del Pasco, tells us that the lessees of the mill do their own work and are making money. They are mining in the Pine Tree lode. This is "clean-up" day at the Kimball mill. Messrs. Bagley and Marlow are developing a promising mica mine 2½ miles from Williamson Valley. The vein is large and so are leaves of mica. Messrs. Burton and Murphy have leased one of Major Dake's Walker District mines. They expect to take out silver worth $300 per ton. Some 20 miners are at work in the Lane mine, the ore of which is being worked at the Tuscumbia mill. The St. Louis Yavapai Company, of Humbug district, think their mill will be running in about thirty days.

NACOSARI.—Tombstone *Epitaph*, August 8: All indications point to Nacosari as the coming new camp, about which the boom is to center. The operations of the New Jersey and Sonora company have been so successful that other companies have been organized with equally good prospects, and the time is not far distant when that camp will be the scene of very extensive operations. New strikes are constantly reported; placer diggings have been discovered a few miles west, and gold is being brought in every day. The country is a natural tributary to Tombstone, which has already been largely the gainer by the trade of that section. A weekly stage line has been put on from Tombstone, and communication between the two places is now rapid and easy. The new camp is delightfully situated in the foot-hills of the Sierra Madres, which have been in the past, and will continue to be in the future, the great mineral producing mountains of the world. The detached spurs of mountains in eastern Arizona are but the continuation of that range, and form the connecting link between the Rockies and the mother mountains. As Humboldt predicted, here lie the great mineral deposits of the continent, and every day is proving the truth of the prediction.

THE OLD STAND-BY.—Mohave County *Miner*, August 6: This mine is on the dividing ridge between Stockton and Cerbat, and is now owned by J. J. Hyde. It is some ten years since this claim was located, and more or less work has been done on it ever since, but no shipments of ore were ever made from it until the present proprietor took hold of it, and in February last shipped a carload to San Francisco which sampled 25 ounces in silver and 45 per cent lead. A tunnel is now being run on the ledge and is now in about 50 ft, showing about seven inches of solid galena in the face. The Black and Tan is another old location with a good reputation for high-grade ore, and is now owned by Tubman Ayres of Cerbat. The developments of this claim consist of two tunnels run in on the ledge at opposite sides of the gulch, one being about 80 ft and the other about 340 ft long. Mr. Ayres has recently leased this valuable property to Messrs. Williams and McCue, two good hard-working miners from Nevada who bid fair to make some money out of it. When we take in consideration the fact that ore from this mine is worth from $150 to $600 per ton, it will be seen that four or five inches of it means big money. The streak shows every indication of still widening out and appears to be similar in appearance and equally as rich as the streak in the face of the tunnel below, which is about five inches wide, and will mill about $400 to the ton. The Sixty-three is a mine as well, if not better, known than any in the county, and is now owned by Mr. Canty. The main shaft is down about 150 ft, but the work of sinking had to be discontinued on account of water. Most of the upper workings have been stoped out by former owners, who realized about $150,000 from them. Mr. Canty has recently commenced work on this mine and has several men engaged in cleaning out the old tunnels and stopes, which require considerable timbering. In the old workings considerable good ore remains which will mill from $60 to $100 and which would not pay to take out in the old days when the mill took pretty nearly everything below $150. The Dictionary is a mine that is now attracting about as much attention as any in Wallapai district. It lies in the Cedars at the foot of Stockton Hill, and was bought by the present proprietors, Messrs. Moore and Labaree, for the insignificant sum of $85, some few months ago. They little realized at that time that they had bought a bonanza. Messrs. Moore and Labaree are two as good miners as will be found in any district, as a glance at their work will show. They commenced operations by starting a tunnel on the opposite side of the hill to where the former owners worked, and expect to tap the ledge in about 200 ft. This tunnel is now in nearly 180 ft, and is being driven in at the rate of about a foot a day. When in about 80 ft a ledge of good-looking ore was cut, which was about five inches wide and assayed some $250. The existence of this ledge had never been dreamed of, as no signs of it exist on the surface. Levels were at once run on the new discovery, the north one being now in about 80 ft and the south one about 40 ft. In running these levels some 20 or 30 tons of ore were taken out which yielded from 150 to 400 ounces in silver. The north level is now being stoped out to the surface, three men being engaged in this work alone. In the stope the ore streak has widened out to about nine inches while the character of the ore is considerably improved. The day we were in the stope there must have been $10,000 of ore already stripped and ready for taking down.

COLORADO.

NOTES.—Georgetown *Courier*, August 9: A good deal of prospecting is under way up Mill creek this season. A great deal of prospecting is being done in Daily and Atlantic districts. A carload of ore was shipped from the Albro mine, at Dumont, on Saturday last. Farris & Co.'s lease on the Joe Reynolds turned out over sixty tons of ore last month. A mill run of 1,214 pounds of ore from Lucas & Co.'s lease on the Telephone returned $465.20. The Brannagan milled some 800-ounce ore a few days since. The second class milled 180 ounces. Several inches of $1,000-ore has been encountered by the lessees on the Owosko lode, Brown mountain. During the month of July the Barrett and Fletcher gold mill at Empire crushed 65 cords, or about 400 tons of ore. A mill run from the Swamp Angel lode, worked by Rockwell & Co., gave 96 ounces in silver and $17 in gold to the ton. The output of ore from the Mendota mine on Sherman mountain for the month of July was 90 tons, 1,110 lbs.; value $6,635.35. The tramway from the Silver Plume mill to the railroad has been completed, which saves 50 cents a ton in the handling of ore. In running 17 ft of a drift upon the Little Giant lode, on Red Elephant mountain, $1,675 was taken out, a fraction over $98 a foot. A contract to sink the shaft on the Big Horn lode, 40 ft from its present depth, has been let to some parties from Idaho springs. A mill run of 12,270 pounds of ore from Louis Bach's lease on the Boulder Nest returned $549.25. The first class milled 224 ounces per ton. John Dean, lessee on the Alhambra, Leavenworth mountain, netted over $300 from his lease last month. The ore mills 623 and 303 ounces per ton in two classes. A syndicate of capitalists from Pittsburg, Pa., are expected to arrive here this week for the purpose of examining the Moore Mining Co.'s property, with a view of purchasing. The shafts of the Baltimore and Fenton are being steadily sunk, and the drifts are being driven ahead. About 60 men are employed. The average value of all the ore shipped is 300 ounces per ton. Messrs. Tallman, Young & Co., lessees on the Main lode, are drifting and stoping easterly, 70 ft down the main shaft, on a very fair vein of ore. A mill run of two tons on Saturday last gave 72 ounces silver and 2-10 of an ounce gold per ton. Michael Doyle and Geo. E. M. Gray have leased and bonded the Night Hawk lode, on Silver creek, and work has been started up. This claim is unquestionably the extension east of the Joe Reynolds No. 3 lode. Some good mineral has been taken from the shaft. One lot gave 640 ounces silver to the ton. Between sixty and seventy men are at present employed on the Seven-Thirty, and the work of development is steadily progressing. Nine drifts or headings are being driven and new ground continually opened up. During the past six months, 1,000 feet of drift have been added to the already very extensive underground workings. In the month of July, 41 tons of smelting ore were shipped, averaging $138 per ton after deducting freight and smelting charges.

IDAHO.

COEUR D'ALENE.—*Eagle*, August 4: For the amount of development Coeur d'Alene shows up better prospects than the most sanguine expected last year. We are very slowly, but surely, recovering from the effects of the collapse. There is a gradual increase in the amount of gold shipped from the camp which is doing silent, but serviceable, work in advertising its real worth. Coeur d'Alene is rapidly achieving success. One month ago the camp was regarded as an immense railroad fraud, and every paper in the country, when hard up for legitimate matter, interviewed some pimp or tin-horn gambler who had "gone broke" in Coeur d'Alene, and would villify the camp to the extent of two columns for a drink of coffin varnish. Now, the press of the country are silenced by the steady and increasing output of dust from Coeur d'Alene, and they are beginning to concede to us respectful recognition as a bona fide mining camp. This is a great concession, and one for which we are duly thankful. All we need is liberal advertising to draw the attention of capital to our mineral wealth. Many a poor prospector owns a valuable ledge, which can be bought for a trifle. Coeur d'Alene is only one camp out of a hundred which is inviting capital, it is true, but it is equally true that it is first in the attractions it offers to those desirous to invest in mining enterprises, and it offers more for the money than any other camp has ever done before.

NEW MILL.—Idaho *World*, August 6: The Forest King Co. have sent by telegraph for a mill just like the one now at work at the Golconda mine. Some of the company went up to the Golconda mine on Friday last, and were well pleased with Monroe & Co.'s mill, came back and telegraphed for the mill to be shipped immediately. It will be put up and set to work as soon as possible on its arrival. The Forest King is proving itself to be one among the best mines in the country. It is about six miles from this place, and its locality can be seen from certain points here distinctly. Things are beginning to look up in this county, and the day is not very remote when our hills will be full of quartz mills.

BELLEVUE KING.—Belluvue *Chronicle*, August 7: As work progresses on the Bellevue King it continues to loom up in grand proportions. Both walls have been found and the vein will average six feet in width, two feet of which is very rich gray copper ore. The company are now sinking the shaft and raising from the tunnel to make connection for air. They have a carload of ore that will yield $1,000 per ton ready for shipment, and there are on the dump over one hundred tons of second-class rock which will yield an average of $100 per ton and more. The Chicago, owned by the W. R. S. Co., and patented last year, lies parallel with the King and has every indication of being as valuable property and it is strange the company do not expend a few hundred dollars in developing it.

SNAKE RIVER BLACK SAND. Boise *Democrat*, August 8: Several weeks since H. S. Cheasbro, with a force of men, gathered up something like a ton of black sand on Snake river, near Walker & McOuat's ferry, and sent it to Omaha for testing. It had never been supposed that this sand contained gold, and it had never been tried, the question always being how to get rid of it in mining the banks and bars of the river. Mr. Cheasbro informs us that he has just received the returns on the sand sent to Omaha and the test proves it to have been worth $864 per ton. The result was as unlooked for as startling, and he thinks that on the strength of it the Rhode Island Company, to whom he sold his interests on Snake river, will now come out and go ahead with the dam and other contemplated work; in fact, they write that such is their intention.

MULDOON WORK.—Bellevue *Chronicle*, August 6: Thos. McNara, has been engaged by Supt. Haight, of the Muldoon mine, to take charge of the concentrator, which will be set in motion on Tuesday morning. Thomas was for sometime assistant former of the Minnie Moore works and proved that he was perfectly competent to manage such machinery. The Muldoon has about 600 tons of second-class ore piled up on the dump and in the stopes upon which the jigs will begin at once and the property is opened in such shape that there will be no lack of ore to make a continuous run. One furnace of the smelter will also be fired up in a few days.

MONTANA.

I X L.—Butte *Miner*, August 8: This is situated west of the Burlington mine, and is operated under a lease by Messrs. Archer, Overman and Sarchet. The stopes of the east drift are yielding about 10 tons of ore per day, which is reduced at the Colorado smelter.

The Saturn, immediately west of the Park street bridge, is leased by Baker and Swarnsen. The lead is 3 ft wide. Assays have been obtained as high as 1,000 ounces and a shipment to be made to the mill this week is expected to produce very handsome returns.

The Placer Lode claim, joining the Saturn on the south, is leased by Messrs. Swarnsen, Vineyard and Cane. The lessees have milled 30 tons of ore which returned from 80 to 130 ounces. They have 20 tons now at the Colorado smelter, from which still better returns are expected.

The Orphan Girl, located south of the Big Butte, has so far proven a bonanza for the lessees, Messrs. Wallace, Moffit & Co. At the Dexter mill it was ascertained that the mill had been running steadily on Orphan Girl ore since January 1st, crushing 25 tons per day of average 30-ounce rock, which would give the very handsome aggregate of 157,500 ounces in a seven months' run.

THE ANACONOA REDUCTION.—A rumor gained circulation last week which created considerable excitement to the effect that the Anaconda Company contemplated a considerable reduction of its working force at the mine, and that the reduction would commence with laying off 100 men on the 1st inst. A *Miner* reporter yesterday questioned an officer of the company as to whether or not the rumor had any basis in fact, and was informed that it had not, any further than that as in order to keep up the large shipments of high-grade ore it was now necessary to employ a sufficient force to handle the immense quantities of low-grade ore which is extracted with the shipping ore; that with the completion of the smelter this necessity would cease, and as there would be a larger reserve of extracted ore on hand it would not be necessary to employ so large a force at the mine; and that some reduction would probably ensue, but that no general or sweeping reduction was contemplated.

THE CABLE MILL.—Anaconda *Review*, August 8: The Cable mill Phillipsburg, is at work upon ore from the Cable mine and is running steadily night and day. The mill and surroundings are models of neatness and cleanliness. Harvey Showers, the well known miner, is mine foreman, and John Sloss is foreman in the mill. The power is furnished by a 75 horse-power Corliss engine. At night the mill is lighted by electricity. Phillipsburg bids fair to prove a very lively point this summer. The erection of the 20-stamp mill by the Granite Mountain Co., work on which is announced to begin at once will give employment to a large number of men. Every one will be pleased to learn of the town regaining some of its wonted prosperity.

NEW CONCENTRATES.—The lower workings of the Gray Rock having run into copper, the working force has been taken off from that mine and transferred to the La Plata, which will now be worked with a full force. The Alice mills are keeping up their steady run and average bullion shipments. The Moulton stamps are dropping 40 strong on 40-ounce rock. The increased capacity and liberal policy of the Colorado smelter toward ore sellers and custom mill patrons have given a great impetus to the development of smaller properties. The Dexter mill continues to pound out fine bullion shipments from Orphan Girl ore. The Liquidator continues to ship from 15 to 20 tons of high-grade ore per day. Clark's Colusa is making large shipments of ore to Baltimore. The frame of Clark's new concentrator is up; the machinery is en route and will be in position before the end of September.

NEW MEXICO

MINING MATTERS.—Silver City *Enterprise*, August 6: Messrs. Bonner & Campbell are taking out some excellent ore from a claim two miles east of Fleming, which they will dispose of to ore purchasers making the highest bid for the same. A sample car of ore was shipped during the week from the Telegraph company's property which according to sample will run about $250 per ton. Regular shipments from this property would pay the stockholders handsomely. Peter Wagner's five-stamp mill, at Pinos Altos has been running on custom ore for the past two weeks that averages two ounces in gold per ton. The ore belongs to Mexicans who have considerable quantities on the dumps of their mines. About seven or eight tons per day is what the mill treats. McGregor Bros. have during the past month shipped two carloads of concentrates, returns from which have not yet been received. The mill is working as nicely as could be desired, having had but one slight accident since starting, July 1st. The Mimbres mill is also running on regular time. Two cars of ore, the first of which averaged 304 ounces, were shipped from the Commercial mine, at Georgetown, last month. The returns of the second car have not been received, but Geo. O. Smith states that it will run equally as well. This property will make a record this year that will astonish people not familiar with its management. It is undoubtedly one of the best and most economically managed mines in the territory. Thirty-one men are employed upon the mine at present. The incline is in about 100 feet. There is some talk of commencing work on the coal mines six miles from Lordsburg. The property is owned by residents of that town who have already expended a considerable sum in the development of their prospect. The claims are located very conveniently to the railroad, and if on developments there is coal in any considerable body found, it will be a most valuable find for the owners and the town of Lordsburg as well. The blossom and formation where work was discontinued is similar to that of the Fleming and Bullard's Peak mines, and it is believed that upon sufficient depth being attained the coal would improve. During the past week exploration work upon the Old Man mine has proven most satisfactory. A pocket was encountered from which a considerable quantity of ore was taken that contained free gold, that greatly enhanced its value. It was first discovered in the ore by William Swancoat, who had some trouble in convincing the gentlemen engaged with him in assorting the ore that it was not iron pyrites. Regular shipments of the higher grade ores taken out continues, but the lower grade upon the dumps will receive due attention when the contemplated mill is in operation. The management report everything most satisfactory. As work progresses upon the Gold gulch properties their merits begin to be apparent to persons who a few years ago doubted the existence of ore bodies in that camp. In no mining camp in this territory has development work been done with the rapidity of that performed in this district. On the Young man mine every foot of work shows it up to better advantage and encourages and stimulates Messrs. Rutter, Mikesell and Ficel to renewed efforts in the development of their promising claim. Nearly or quite 250 tons of ore that will go ninety ounces per ton are at present upon the dump ready for shipment. On the surrounding claims, many of which possess merit, ore is being taken out for shipment. When the continuity of the ore bodies has been demonstrated to any great depth capital will not long hesitate in making investments.

OREGON.

NOTES.—Oregon *Sentinel*, August 6: The Sterling mining company have commenced cleaning up. The China mines near Uniontown are still piping but they cannot last long with the present supply of water. All of the Galls creek miners did quite well this season, if it was a short season, so we are informed by Wm. Blackett. Mining has generally suspended throughout the county for the season but considerable prospecting is going on.

UTAH.

REVIEW.—Salt Lake *Tribune*, August 8: The receipts of bullion in Salt Lake City for the past seven months of 1884, excluding ore, were as follows: January, $449,228.74; February $364,696.47; March, $460,366 60; April, $432,809.44; May, $343,416.15; June, $530,532.90; July $530,978.35; Total $3,120,938.65. This does not include a number of current operations which make no reports except at the close of the year. The receipts of bullion and ore in this city for the week ending August 6th, inclusive, amounted to $157,199.70 of which $141,999.55 was bullion, and $15,200.15 ore. The week previous the receipts were $126,364.05, of which $117,044.05 was bullion, and $9,320 ore. The shipments of the Horn Silver Company for the week were twenty-two cars of bullion, $66,000; total for the year to date, $1,444,000. This company has declared its third quarterly dividend for 1884, amounting to $300,000 payable Aug. 15th; total dividends for this year to date, $900,000. This is the fourteenth dividend. The shipments of the Ontario for the week were fifty-two bars, assaying $34,790.93; total product of 1884 to date, $985,787.37. On the 31st ult. the Ontario paid its regular monthly dividend of $75,000 being the ninety-seventh dividend. Seven monthly dividends have been regularly paid this year, of $75,000 (fifty cents a share) each, a total of $525,000, or $3.50 per share. The Crescent sent in two lots of ore, $4,400 and the Park City smelter sent in one car of bullion $1,700. The Stormont sent up during the week three bars of silver, $5,000. The product of the Hanauer smelter for the week was ten cars of bullion, $20,500. Ore is coming down now from the hills freely, and the smelters are well supplied.

WASHINGTON TERRITORY.

CLE-EL-UM.—*Kittitas Localizer*, Aug. 8: Prospecting parties are fitting nearly every day for the Cl-el-um mines, F. D. Schnebly, S. H. Seroy and a stranger started out on Saturday. Jimmy Grieve went down last week from the Cle-el-um mining district. He exhibited some fine specimens of quartz, but was very reticent as to its location. The new coal-fields on the Cle-el-um are not to exceed three miles from the projected railway line through the Stampede pass. The coal is bituminous; of superior quality; easily obtained, and unlimited in quantity. Moses Splawn and Joseph Stephenson returned from their prospecting tour north last week. They were unable to reach the point they started for on account of the snow. Moses Splawn says it is the worst season for prospecting he has seen. Jeff D. McDaniel came down from the Cle-el-um district last week. He says the Steeprun and Gray Eagle have a favorable outlook. And Cooper says there is enough good paying rock in sight in the bullion lode to justify putting up reduction or smelting works, The copper in this mine is fully 60 per cent,

Metallurgy and Ores.

JOHN TAYLOR & CO.,

IMPORTERS AND DEALERS IN

Assayers' Materials,

MINE AND MILL SUPPLIES,

CHEMICAL APPARATUS AND CHEMICALS, DRUGGISTS' GLASSWARE AND SUNDRIES, ETC.

118 and 120 Market Street and 15 and 17 California St., San Francisco.

We would call the attention of Assayers, Chemists, Mining Companies, Milling Companies, Prospectors, etc., to our full stock of Balances, Furnaces, Muffles, Crucibles, Scorifiers, etc., including, also, a full stock of Chemicals.

Having been engaged in furnishing these supplies since the first discovery of mines on the Pacific Coast, we feel confident from our experience we can well suit the demand for these goods, both as to quality and price. Our New Illustrated Catalogue, with prices, will be sent on application.

☞ Our Gold and Silver Tables, showing the value per ounce Troy at different degrees of fineness, and valuable tables for computation of assays in grains and grammes, will be sent free upon application. Agents for the Patent Plumbago Crucible Co., London, England.

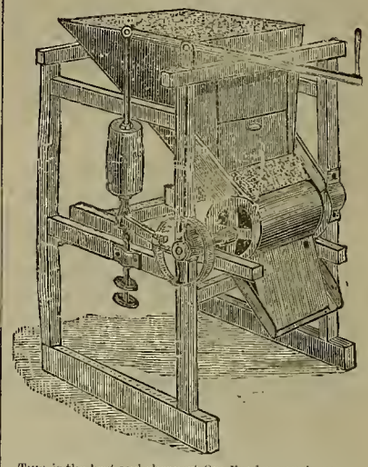
THE ROLLER ORE FEEDER

[Patented May 28, 1882.]



This is the best and cheapest Ore Feeder now in use.

It has fewer parts, requires less power, is simpler in adjustment than any other. Feeds coarse ore or soft clay alike uniformly, under one or all the stamps in a battery, as required.

In the Bunker Hill Mill it has run continuously for two years, never having been out of order or costing a dollar for repairs.

CHICAGO **FRASER & CHALMERS.** ILLINOIS

MANUFACTURERS OF IMPROVED AND APPROVED FORMS OF

MILL AND MINE MACHINERY.

Having made extensive additions to our Shops and Machinery, we have now the LARGEST and BEST APPOINTED SHOPS in the West. We are prepared to build from the Latest and Most Approved Patterns,

QUARTZ MILLS

For working gold and silver ores by wet or dry crushing. The Stetefeldt, Howell's Improved White, Brunton's & Bruckner Furnaces, for working base ores. Rotary Dryers, Stetefeldt Improved Dry Kiln Furnaces.

SMELTING FURNACES,

Water Jackets, either Wrought or cast Iron, made in sections or one piece, either round, oblong, oval or square. Our patterns most extensive in use. SPECIAL FURNACES FOR COPPER SMELTING. Slag Pots and Cars, Improved form. Bullion and Copper Moulds and Ladles, Litharge Cars and Pots, Cupel Furnaces and Cars.

Frue Ore Concentrator, or Vanner Mills.

Coarse Concentrating Works, Improved Jigs, Crushing Rollers, Sizers, Trommels, Ritzonger Tables, and all other adjuncts for the proper working of Gold, Silver and Copper Ores, complete in every detail.

HALLIDIE IMPROVED ORE TRAMWAYS. We refer to Gen. Custer mine, Idaho, 5,000 feet long; Columbus Mine, Col., 4,750 feet long; Mary Murphy mine, Col., 5,000 feet long, all in constant operation.

LEACHING MILLS,

Improved Corliss and Plain Slide Valve Meyer's Cut-off Engines.

CORLISS ENGINES from 12x36 Cylinders to 30x60. PLAIN SLIDE VALVES from 6x10 to 36x36. BOILERS of every form, made of Pine Iron Works C. H. No. 1 Flange Iron, or Otis Steel. Workmanship the most careful. All Rivets Hand Driven.

HOISTING ENGINES Large or Small for flat or round rope. Double Cylinder Engines, from 6x10 to 18x60. This latter size furnished J. B. Haggin or Olant and Old Abe Co., Black Hills also Corliss Pumping Engines, 26x60, for Hoisting and Pumping Works, for 2,000 feet deep. **Baby Hoists for Prospecting, 4 H. P. to 6 H. P.**

Wire Rope, Safety Cages and any Size and Forms of Cars. **McCaskell's Patent Car Wheels and Axles—Best in Use.**

Principal Office and Works, Fulton and Union Sts., Chicago, Illinois. **New York Office, Walter McDermott, Manager, Room 32, No. 2 Wall St.**

F. A. HUNTINGTON,
SAW, SHINGLE, AND QUARTZ MILL MACHINERY.

We Call Attention to the Following Testimonials as to the Capacity and Durability of the Centrifugal Roller Quartz Mill:

SAN FRANCISCO, Dec. 27, 1883.

Mr. F. A. Huntington, San Francisco, Cal.—DEAR SIR—The four-foot Centrifugal Roller Mill, bought of you in August, 1882, for the Whidden Gold Mining Company, of Shingle Springs, has given entire satisfaction, both on our own and on custom work, saving from 85 to 90 per cent of the gold in the mill. In conclusion I will say that we are so well pleased with it that Mr. Whidden and myself are putting one of the same size on the Tohongo gold mine, near Ravenna, in Los Angeles county.

Yours truly, P. VEASEY,
34 California St., S. F.

FINE GOLD GULCH, Nov. 10, 1883.

Mr. F. A. Huntington, San Francisco, Cal.—DEAR SIR—In reply to your inquiry concerning the working of your Centrifugal Roller Quartz Mill, I am pleased to say that I run one of them for seven months, doing custom work on different varieties of rock, and that the mill gave satisfaction in every respect, and did all that you claim for it.

Yours truly, BYRON JENNINGS.

GARIBALDI MINE, Dec. 17, 1883.

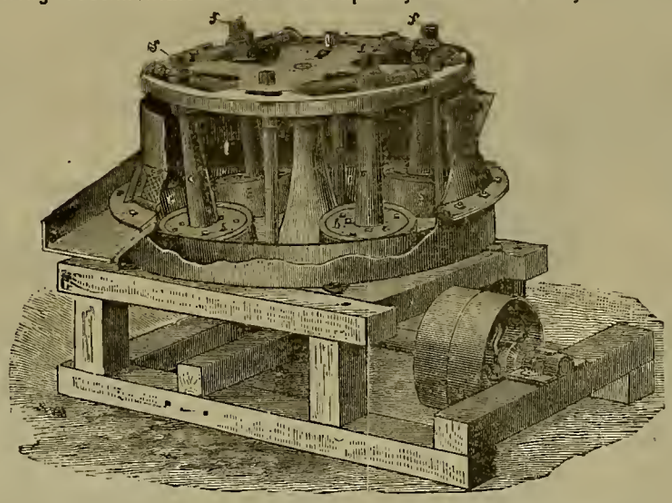
F. A. Huntington, Esq., San Francisco, Cal.—DEAR SIR—In reply to yours of the 10th inst., I take pleasure in assuring you that your Centrifugal Roller Quartz Mill gives entire satisfaction, and I can heartily recommend it to mining men who want a cheap and efficient crusher.

Yours truly, E. I. PARSONS, Supt.

32 WASHINGTON AVENUE,
SAN FRANCISCO, Dec. 29, 1883.

F. A. Huntington, Esq., San Francisco, Cal.—DEAR SIR: Having run one of your Centrifugal Roller Quartz Mills on sample lots of rock from more than twenty different mines, I must say that in every instance it has given the best of satisfaction in every particular; and I recognize its superiority over any other mill manufactured.

Very truly yours, D. O. MOWRY.



CENTRIFUGAL ROLLER QUARTZ MILL.

The work done by the Centrifugal Roller Quartz Mill, during the past two years, on various mines and different kinds of rock, PROVES ALL THAT IS CLAIMED FOR IT, VIZ.:

1. The cost of same capacity is not more than one-half that of stamps.
2. Freight to mine one-fourth that of stamps.
3. Cost of erection at mine one-tenth that of stamps.
4. It runs with one-third the power per ton of ore crushed.
5. The wear is less than that of stamps.
6. The wearing parts are easily duplicated.
7. It has a much better discharge, and leaves the pulp in better condition for concentrating.
8. It is a better Amalgamator, saving fully nine-tenths of the gold in the mill; the balance can be saved on plates in the usual manner.
9. It is continually crushing; not like the stamp, using power to suspend it in air ninety-nine one-hundredths of the time and the balance making a thundering noise, and accomplishing *comparatively* small results. It is as far in advance of the stamp mill as the present method of making flour with improved rolls is over the Indian's mode of crushing corn in a stone mortar.

PATTEN'S CONCENTRATOR.

This machine requires less power, less care or attention, and is less liable to get out of repair than any concentrator now in use; all of which any practical miner will comprehend when seeing it in operation.

SONORA, CAL., Dec. 1, 1883.

F. A. Huntington, Esq., San Francisco, Cal.—DEAR SIR:—In reply to yours of recent date, inquiring about the Centrifugal Mill which I bought of you, I will say that I have run the mill four months on hard rock; and I take pleasure in adding that the mill has in every way given the best of satisfaction.

Yours truly, J. H. NEALE.

GARIBALDI MINE,
Calaveras Co., Cal., Dec. 17, 1883.

F. A. Huntington, Esq., San Francisco, Cal.—DEAR SIR:—In answer to your inquiry concerning the working of the five feet Centrifugal Mill, bought of you for the Garibaldi mine in Calaveras county, I take pleasure in saying it gives entire satisfaction in every respect, and I only regret that the mine does not warrant the purchase of more of them and the continued use of the one now in operation.

Very truly yours, O. B. SMITH.

F. A. Huntington Esq., San Francisco, Cal.—DEAR SIR—Your Centrifugal Roller Quartz Mill has run on the Whidden Gold Mining Co. property at Shingle Springs, El Dorado Co., Cal., about four months, and it has done good and satisfactory work, a greater proportion of gold remaining in the mill than in the stamp battery. FRED JONES, Supt.

HILDRETH RANCH, Fresno Co., Cal.,
January 11, 1884.

F. A. Huntington, Esq., San Francisco, Cal.—DEAR SIR—In regard to your mill (Centrifugal Roller), I have crushed about 500 tons of rock in the mill, and am glad to say that it has given entire satisfaction, and can recommend it to the public as the most expeditious and least expensive method for crushing and milling ore that I have ever seen. Truly yours,

THOS. HILDRETH.

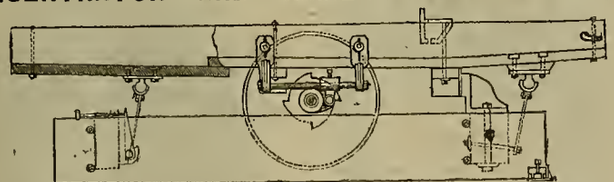
MILLS ERECTED WITH ALL APPLIANCES COMPLETE. CAPACITY AND DURABILITY GUARANTEED

F. A. HUNTINGTON, 45 Fremont St., San Francisco.

☞SAMPLE LOTS OF ORE WORKED.☜ ☞WHERE A MACHINE CAN BE SEEN IN OPERATION.☜

PATTEN'S

CONCENTRATOR AND AMALGAMATOR COMBINED.



This machine requires less power, less care or attention, and is less liable to get out of repair than any Concentrator now in use. All of which any practical miner will comprehend when seeing it in operation.

The wear and tear is nominal, and the construction so simple that any miner can put it up and run it; and the low price brings it within the reach of all millmen, as it will save enough to pay for itself in any mill in a very short time. One machine will concentrate the tailings from a five-stamp battery.

The undersigned is now located at the Ætna Iron Works, 217 to 221 Fremont street, where he is building the above machines and prepared to fill orders, and guarantee them to do all that is claimed. Weight 625 pounds; price, $300. **Estimates given and orders promptly filled for all kinds of Mining Machinery.**

☞ Assays and practical working tests made of ores.

C. W. PATTEN, 217 Fremont St., San Francisco.

THE JENKINS STANDARD PACKING

IS ACKNOWLEDGED BY USERS AS THE BEST in the world. Unlike all other Packings, the **Jenkins Standard Packing** can be made any thickness desired in a joint by placing two or as many thicknesses together as desired, and following up joint, it vulcanizes in place and becomes a metal of itself (it is frequently called Jenkins Metal), and will last for years, as it does not rot or burn out. Avoid all imitations, as a good article is always subject to cheap imitations. The **genuine** has stamped on every sheet **"Jenkins Standard Packing,"** and is for sale by the Trade generally.

Manufactured only by

For Sale by
DUNHAM, CARRIGAN & CO., San Francisco, Cal. | JENKINS BROS., 71 John St., New York.

ELECTRIC AMALGAM.

$2 per pound, $1 per half pound Trial Bottle, Post Paid.

SEND FOR TRIAL LOT and CIRCULARS.

THIS IS AN ABSOLUTE STORAGE OF ELECTRICITY,

Saving Gold, Keeping Plates Bright, Soft, and Clean, Prevents Flowering and Sicking of Quicksilver.

UNITED STATES ASSAY OFFICE, 30 WALL ST.

NEW YORK, July 9, 1884.

Electric Amalgam Company—GENTLEMEN: We have analyzed a sample of your Sodium [Electric] Amalgam, which gave 2½ per cent of Sodium. We have used 10 parts of common quicksilver on a small quantity of free gold ore, and extracted 5 ounces per ton. By use of 8 parts of common quicksilver and 2 parts of your Amalgam, extracted at the ratio of 36 ounces per ton. Yours respectfully, (Signed) TORREY & EATON.

DR. J. H. RAE, Agent, 7 Exchange Place, Boston, Mass.

A. T. DEWEY.
W. B. EWER.
GEO. H. STRONG. } **Dewey & Co.'s Scientific Press Patent Agency** { ESTABLISHED 1860.

INVENTORS on the Pacific Coast will find it greatly to their advantage to consult this old, experienced, first-class Agency. We have able and trustworthy Associates and Agents in Washington and the capital cities of the principal nations of the world. In connection with our editorial, scientific and Patent Law Library, and record of original cases in our office, we have other advantages far beyond those which can be offered home inventors by other agencies. The information accumulated through long and careful practice before the Office, and the frequent examination of Patents already granted, for the purpose of determining the patentability of inventions brought before us, enables us often to give advice which will save inventors the expense of applying for Patents upon inventions which are no new. Circulars of advice sent free on receipt of postage. Address DEWEY & CO., Patent Agents, 252 Market St., S. F.

Mining Share Market.

While considerable interest is shown in stocks just now prices have been downward. After the recent rise dealers seemed to take fright and the market has not been sustained. Notwithstanding all that is being said against the Comstocks, work in the various mines on the lode goes on as usual. It is expected that the Consolidated Virginia and California claims—the great bonanza mines—which were formerly one and were segregated, will again be consolidated as one mine to save expenses of salaries for officers.

Quartz continues to increase at the bottom of the deep winze below the 3200 level of the Mexican. The west crosscut on the 500 level of Ophir is being rapidly advanced toward a point where it is expected a large amount of good milling ore will be found.

At the Best and Belcher and Gould and Curry the north drift from the 825 station of the Bonner shaft is being rapidly advanced through new ground, and will soon be in a sufficient distance to begin running crosscuts.

The Chollar folks have reached ground in the main south drift on their 2800 level that shows much quartz. It was a "false alarm" about their having commenced crosscutting a few days ago, but now crosscutting has really been commenced on this level. At Gold Hill the usual quantity and quality of ore is being extracted from the old upper levels and sent to the mills on the river.

Bullion Shipments.

Paradise Valley, Aug. 4, $4,748; Hanauer, 4, $2,000; Horn Silver, 4, $12,000; from Boise, Idaho, 6, $37,192; Ontario, 5, $9,199; Horn Silver, 5, $24,000; Day, 5, $9,708; Ontario, 6, $5,189; Horn Silver, 6, $6,000; Hanauer, 6, $8,100; Wood River, 6, $7,500; Stormont, 6, $5,000; Lexington, July 28, $20,368; Allen Hay, 30, $2,912; Dexter, 30, $7,408; Alice, 30, $5,840; Moulton, 30, $14,832; Dexter, 29, $7,936; Alice 29, $18,000; Lexington, Aug. 1, $20,112; Silver Bow, 1, $24,000; Ontario, 7, $5,515; Horn Silver, 7, $9,000; Hanauer, 7, $3,850; Crescent, 7, $4,400; Wood River, 7, $1,550; Ontario, 9, $11,175; Hanauer, 9, $1,700; Crescent, 9, $1,850; Hanauer, 10, $4,800; Wood River, 10, $4,850; Bodie, 5, $1,755; Navajo, 11, $10,000. Salt Lake banks report the receipts for the week ending August 6th, inclusive, $141,999.55 in bullion and $15,200.15 in ore; a total of $157,199.70. During the week ending August 10th forty-two cars of bullion and forty cars of ore were shipped East out of Utah.

COMPLIMENTARY SAMPLES OF THIS PAPER are occasionally sent to parties connected with the interests specially represented in its columns. Persons so receiving copies are requested to examine its contents, terms of subscription, and give it their own patronage, and, as far as practicable, aid in circulating the journal, and making its value more widely known to others, and extending its influence in the cause it faithfully serves. Subscription rate, $3 a year. Extra copies mailed for 10 cents, if ordered soon enough. Personal attention will be called to this (as well as other notices, at times), by turning a leaf.

Our Agents.

OUR FRIENDS can do much in aid of our paper and the cause of practical knowledge and science, by assisting Agents in their labors of canvassing, by lending their influence and encouraging favors. We intend to send none but worthy men.

JAKED C. HOAG—California.
J. J. BARTELL—California.
A. S. DENNIS—San Mateo county.
A. C. KNOX—Nevada (State.)
B. W. CROWELL—Fresno and Tulare counties.
JOHN H. STURCKE—Santa Clara and San Benito counties.
GEO. MCDOWELL—Plumas and Sierra counties.
WM. PASCOE—San Francisco.
WM. H. COOK—Alameda county.
H. G. PARSONS—Idaho and Montana.

PROGRESSIVE SCIENCE IN OPTICS.—There is no calling requiring such constant study as that of a first-rate optician, to whom the progressive developments of the present day continually present new difficulties and problems to solve. By close attention to his profession, and over thirty years' practical experience, C. MULLER, the well known optician, 135 Montgomery street, has gained for himself the gratifying distinction of being the leading optician of the Pacific coast. All complications of defective vision most carefully tested free of charge. Sole depot of Pebble Spectacles. 2

Cheap Ore Pulverizer.

There is for sale in this city, by I. A. Heald, American Machine and Model Works, 111 and 113 First street, a Rutherford Pulverizer, an improved revolving barrel crusher, which was only used a few times and is as good as new. It will be sold very much below costs, and miners who are in need of such an appliance for a small mine will do well to make inquiries concerning it. It is suitable for a pulverizing mill for powder or other substances. References as to above can be had upon applying to this office.

IMPORTANT additions are being continually made in Woodward's Gardens. The grotto walled with aquaria is constantly receiving accessions of new fish and other marine life. The number of sea lions is increased, and there is a better chance to study their actions. The pavilion has new varieties of performances. The floral department is replete, and the wild animals in good vigor. A day at Woodward's Gardens is a day well spent.

MINING SHAREHOLDERS' DIRECTORY.

COMPILED EVERY THURSDAY FROM ADVERTISEMENTS IN MINING AND SCIENTIFIC PRESS AND OTHER S. F. JOURNALS.

THE EMBREY CONCENTRATOR.

Having sold my interest in the EMBREY CONCENTRATOR to the Frue Vanning Company, I offer for sale at cost a few I have on hand to close the business.

STEPHEN P. M. TASKER,
Fifth and Tasker Sts., PHILADELPHIA, PA.

WANTED.

By a sober, intelligent American, employment as Machinist, Agent, Writer, Engineer or Explorer, in any place or climate, where risk is considered in determination of wages. Address

WM. WALES, San Francisco, Cal.

PACIFIC POWER CO.

Room with steam power to let in the Pacific Power Co.'s new brick building, Stevenson street, near Market. Elevator in building. Apply at the Company's office, 314 California street.

REMITTANCES to this office should be made by postal order or registered letter, when practicable. Cost of postal order, for $15 or less, 10 cts.; for registered letter, in addition to regular postage (at 3 cts. per half ounce), 10 cts

PATENTS AND INVENTIONS.

List of U. S. Patents for Pacific Coast Inventors.

From the official list of U. S. Patents in DEWEY & CO.'s SCIENTIFIC PRESS PATENT AGENCY, 252 Market St., S. F.

FOR WEEK ENDING AUGUST 5, 1884.

303,125.—ROCK PULVERIZER—Wm. Corcoran, S. F.

303,731.—SAFETY CAR TRUCK—J. Denechaud, Sr., S. F.

303,143.—WAVE POWER—Wm. Filmer, S. F.

303,000.—COFFER DAM FOR SCREW PROPELLER SHIPS—Chas. Goodall, S. F.

303,153.—GRAIN DRILL—C. G. Hampton, Turock, Cal.

303,012.—PEN HOLDER AND WIPER—P. D. Horton, Grass Valley, Cal.

303,013.—PEN HOLDER—P. D. Horton, Grass Valley, Cal.

303,223.—HARROW—W. A. Howard, Dixon, Cal.

303,039.—TIGHTENING DEVICE FOR TRUNK STRAPS—N. K. Pearson, S. F.

303,232.—SEPARATING GOLD AND SILVER FROM ARSENIDE OF IRON—Edw. Probert, Eureka, Nev.

NOTE.—Copies of U. S. and Foreign Patents furnished by DEWEY & CO., in the shortest time possible (by telegraph or otherwise), at the lowest rates. All patent business for Pacific coast inventors transacted with perfect security and in the shortest possible time.

Notices of Recent Patents.

Among the patents recently obtained through Dewey & Co.'s SCIENTIFIC PRESS U. S. and Foreign Patent Agency, the following are worthy of special mention:

CHIMNEY.—Leonard E. Clawson, S. F. No. 302,621. Dated July 29, 1884. This invention relates to the class of chimneys such as are made of cement or pottery-ware; and it consists of a joint and joint-band for the meeting ends of the sections, and the means for connecting the lower end of the chimney with a base or fireplace, and supporting the same on beams or studding of the building, and in certain details of construction.

WAVE POWER.—Wm. Filmer, S. F. No. 303,143. Dated Aug. 5, 1884. This is a machine for utilizing the power of the waves or breakers on the sea coast. It is an improvement on a former invention. It consists in a novel construction of the float, adapting it to take advantage of the impact or blow of the wave, and in various improvements in the gearing and intermediate devices by which the motion of the wheels to the float is transmitted to suitable machinery. The object is to provide means for utilizing the entire power of the wave.

Educational.

W. E. CHAMBERLAIN, JR T. A. ROBINSON.

PACIFIC Business College, 320 POST ST. SAN FRANCISCO.

Returned to new building, former location, 320 Post street, where students have all the advantages of elegant halls, new furniture, first-class facilities, and a full corps of experienced teachers. ☞ Send for Circulars. LIFE SCHOLARSHIP, $70.

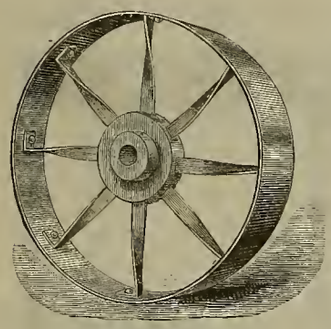
MACBETH'S

—PATENT—

STEEL PULLEY



Advantages of these Pulleys.

They are less than half the weight of cast-iron pulleys; are polished on the face; are made either crowned or straight, and are turned in the lathe the same as the best make of cast-iron pulleys.

They are carefully balanced. They are subject to no contraction strains, and can be run at very high speed without danger of bursting.

On account of their great lightness and the form of the arms, they absorb less power than any other pulley.

They are *the only pulley of the kind* which runs true. They cannot be broken in transport.

TESTIMONIAL:

MATHER LANE SPINNING CO. (Limited), LEIGH, ENGLAND, Nov. 5, 1883.

N. Macbeth, Esq.—Dear Sir: The Patent Steel Pulleys supplied throughout to our No. 2 Mill are working to our entire satisfaction.

They are very true, and are about 50 per cent lighter than the cast-iron pulleys in our No. 1 mill.

Yours faithfully,

For the Mather Lane Spinning Co. (Limited),

[Signed:] RICHARD T. MARSH, Managing Director.

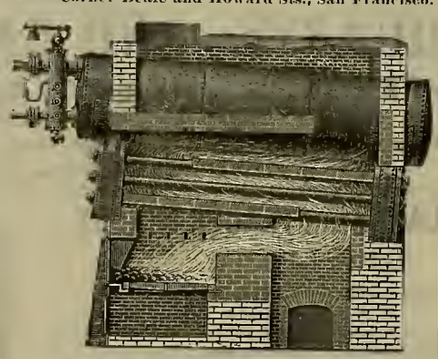
Economy in space and fuel. Safety at high pressures. Freedom from scaling. Equally adapted for power and heating purposes. Especially adapted for mills, factories, hotels, stores or any place where safety is a necessity. Will work well with muddy water and any kind of fuel.



TESTIMONIALS.

ST. LOUIS, MO., Sept. 28, 1883

Messrs. Adolphus Meier & Co GENTLEMEN: We cheerfully certify that the "*Heine Patent Safety Boiler*" put up by you in our establishment has proved very satisfactory in its working. The chief points of excellence in the "Heine Safety Boiler" are its economy in fuel and space, freedom from scaling, aptitude for power and heating purposes, working equally well with clear and muddy water. We warmly recommend it to all using steam machinery. Yours truly,

ANHEUSER-BUSCH BREWING ASS'N

OFFICE OF SUP'T OF ROYAL RAILWAYS, BERLIN, Sept. 23, 1883.

To Mr. H Heine, Civil Engineer: In reply to your inquiry of September 2d, we respectfully inform you that the three boilers built under your patents, under steam since September 25, 1881, at the Alexander Place Depot, as well as the two at Friedrich Strasse Depot, under steam since September 22, 1882, have given good satisfaction, requiring no repairs whatsoever to date. The internal cleaning of the boiler was always accomplished with ease on account of the convenient arrangement of the tube caps, the adhesion of scales being fully prevented thereby, and the boilers kept in prime condition.

(Signed): BEAUCKE.

BAKER'S MINING HORSE POWER.

THE MOST EFFICIENT AND PRACTICAL MACHINE ever invented for the service of Prospectors and others requiring the use of a Horse Power; possessing all the requirements of a first-class hoist and affording means for the continuous operation of a Pump or Blower without interfering with a hoisting apparatus.

It is made entirely of Iron: no piece weighs over 250 pounds. At the ordinary speed of a horse a 1,000-pound bucket of ore may be raised 120 feet per minute. The hoisting drum is under the complete control of the man at the shaft, and is capable of carrying 500 feet of five-eighths steel rope. The cost of erection is slight, as two men in half a day can easily put it in place ready for work.

While this power is more particularly for mining purposes, it is equally adapted to all other uses where animal power is required. ☞SEND FOR CIRCULAR. Address

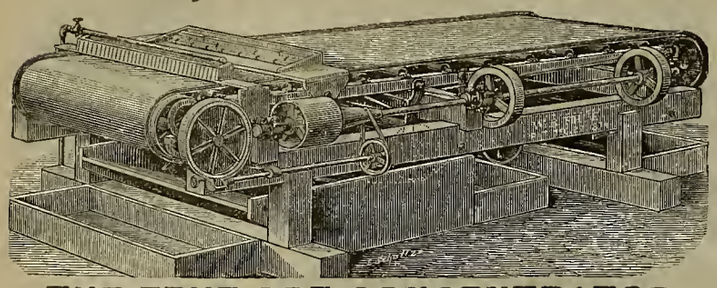
PRICES GREATLY REDUCED.

IRON CLAD MANUFACTURING CO.,
22 Cliff Street, New York.

$1,000 CHALLENGE!



THE FRUE ORE CONCENTRATOR,
OR VANNING MACHINE.

PRICE REDUCED, Jan. 1, 1884, to FIVE HUNDRED and SEVENTY-FIVE DOLLARS ($575.00).

OVER 800 ARE NOW IN USE. Saves from 40 to 100 per cent. more than any other Concentrator; concentrations are clean from the first working. The wear and tear are merely nominal.

A machine can be seen in working order and ready to make tests at the office of Hinckley, Spiers & Hayes, No. 220 Fremont Street, San Francisco.

To those Intending to Manufacture or Purchase the So-called "Triumph" Concentrator, we Herewith State:

That legal advice has been given that *all shaking motion* applied to an *endless traveling* belt used for concentration of ores is an infringement on patents held and owned by the Frue Vanning Machine Company.

That suit has been commenced in New York against an end-shake machine similar to the Triumph, and that as soon as decision is reached in the courts there, proceedings will be taken against all Western infringements.

That we are and have been ready, at any time, to make a competitive trial against the Triumph, or any other machine, for stakes of $1,000.

PRICE FIVE HUNDRED AND FIFTY DOLLARS ($550.00), F. O. B.

THE "TRIUMPH" TRIUMPHANT!

In a competitive trial recently had between two of the "Triumph" Ore Concentrators and the same number of "Frue" Vanning Machines, at the mill of the celebrated gold producing Original Empire Mill and Mining Company, in Grass Valley, Nevada County, Cal., the "Triumphs" produced thirteen and fifteen one-hundredths (13.15) per cent more concentrations than did the "Frue" Vanners, during a run of twenty-four consecutive days, or a net gold coin result of $109.15, or $8.30 per day, in favor of the two "Triumph" Concentrators.

These returns do not include the value of the amalgam saved by the "Triumphs" during the test; which will add to the net gain. The form of construction of the feed bowl is such that considerable amalgam is necessarily saved, which is lost on the "Frue" Vanner.

This trial was conducted under the personal supervision of the Manager and Superintendent of that Company, in a strictly fair and impartial manner, and with the sole view of determining, in the interest of that Company, the merits and demerits of the respective machines by a thoroughly practical test. A relation of the course of procedure, a concise analysis of assays, and a tabulated statement of the net bullion results, with accurate deductions therefrom, will soon be published in Circular form.

The superiority of the present construction of the "Triumph" over the form originally introduced, together with the demonstrated results of the above, and other trials had with the "Frue" Vanners, induce us to and we hereby accept the Challenge of $1,000, flaunted by the Agents of the "Frue Vanning Machine Company," and hold ourselves in readiness to enter into a second competitive trial for that sum, at such place and upon such terms and conditions as may hereafter be mutually arranged.

We guarantee purchasers against all costs, expenses or charges incurred by reason of any infringements of any existing patents.

Ore Concentration.

The concentration of mineral bearing ores and expedients for saving the precious metals they contain are subjects which are now attracting more attention than ever before in the history of mining. It is a well recognized fact that there are vast deposits of low grade ores in nearly every mining district that with some cheap and effective mode of concentration and amalgamation might become a source of great wealth. Bonanza mines are not as plentiful as we could wish, and mining men are beginning to realize the fact that the great dependence for the future must be on the ores referred to. Success in handling ores of this character must depend not only upon generally favorable conditions, but upon the ability to obtain by the first working what metal the ore carries, either in a free state or in the form of sulphurets, with a reasonable degree of closeness. That loss is sustained in this way by the best devices used heretofore, is a fact patent to every one familiar with the business.

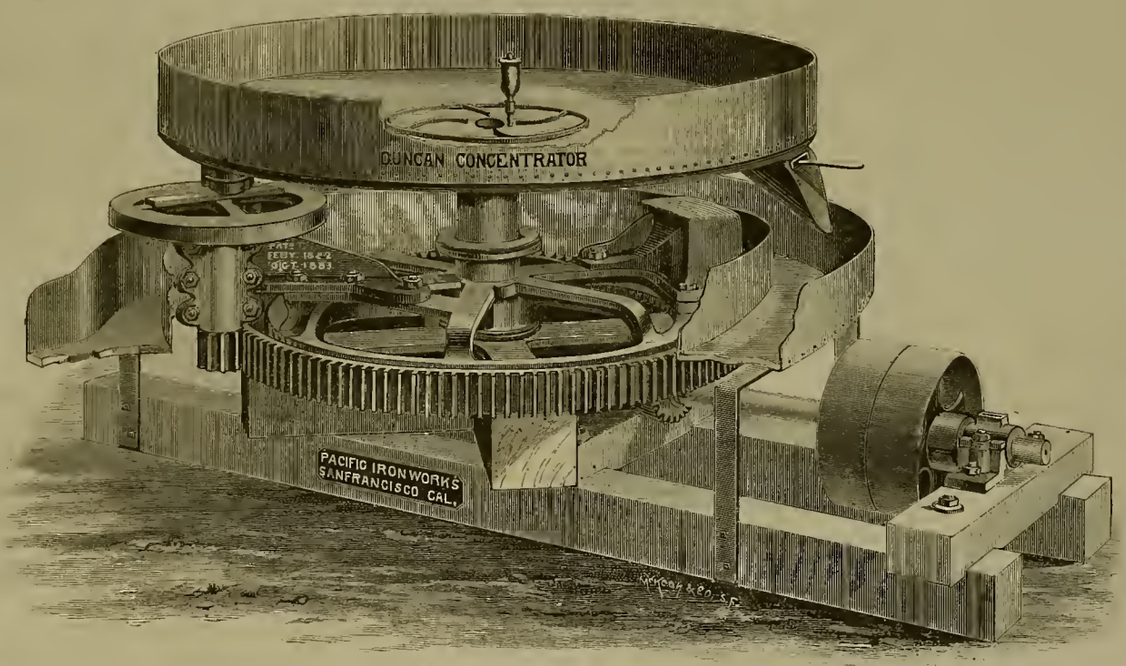
Expedients without number have been resorted to with a view to meeting this difficulty, but from various causes it must be confessed that the problem has not been satisfactorily solved. The first requisites for such machines are cheapness and simplicity of construction. Most of those now in use involve an expense out of all proportion to results, as well as a complication of construction that requires special skill to operate and make constant repairs necessary.

The Duncan concentrator illustrated on this page is claimed to obviate the objection urged against all forms of belt machines, and, though only introduced about eighteen months ago, is rapidly winning its way to popular favor.

This machine, as will be observed, operates upon a new principle, uniting by a very ingenious movement both a circular and jigging motion, the circular throwing the sulphurets to the outer rim of the pan and the jigging settling them to the bottom, where they are drawn out through a transverse opening and discharged into a circular tank, as shown in the cut, while the tailings flow to the center, through which they pass down and discharge into a sluice.

The pan by this circular motion, making eight revolutions per minute, causes the pulp to pass around and over its surface about three revolutions, or equal to a distance of thirty feet, before it is discharged, thereby giving the sulphurets sufficient time to settle before the gangue passes of. An adjustable tube regulates the overflow, which, in connection with the opening given the discharge gate, determines largely the closeness of working and cleanness of the product. It also has an adjustable wrist-pin on the balance-wheel, by which the motion can be varied to adapt it to the requirements of different classes of ore.

Another important feature of this machine and one that is not claimed by any other, is its quality as an amalgamator. The bottom soon wears bright by the attrition of the sand and collects all the amalgam that escapes the copper plates in a gold mill, or passes the settlers in a silver mill, and is more efficient in this way than any machine ever devised for this special purpose. A mill running six of them reports a saving of from $1,000 to $1,500 per month in amalgam that could not be saved by any other device.



THE DUNCAN ORE CONCENTRATOR.

The article appended, from the Arizona *Mining Index*, giving an account of a competitive test of the Duncan concentrator with the Frue at the Carlisle mine, with the statement of Col. James as to results, will be read with much interest by mining men in all parts of the country. The question of ore concentrators is an important one, and any facts throwing light on the subject are of value to the whole mining community.

"No class of mining machinery has so wide an application to this industry, or is regarded as so essential in the process of ore reduction, as the concentrator. The most interesting, as well as the most important test of the comparative merits of the two prominent systems of ore concentration that has ever been made in this country, has been recently concluded at the Carlisle mine, in New Mexico. The contest referred to has attracted so much attention throughout Arizona and New Mexico, that we have taken much pains to get the full particulars regarding it to lay before our readers. The following statement, furnished us at our request by the Pacific Iron Works of San Francisco, giving exact figures and details, will be read with great interest by mining men in in all parts of the country. The works referred to are the manufacturers of the Duncan concentrator, which, as will be seen, makes a record that has never been approached by any machine heretofore made.

OFFICE OF THE CARLISLE MINING COMPANY,
CARLISLE, GRANT CO., NEW MEXICO,
June 28, 1884.

PACIFIC IRON WORKS, San Francisco, Cal.—

Dear Sirs: In compliance with your request, I send you the following as the result of my trial of six Duncan and five Frue vanner concentrators, made in the months of February and March of the present year:

Length of run, eighteen days, nineteen and a half hours.

Four batteries of five stamps each, fed from the same ore bins.

Pulp from Nos. 1 and 3 went to the Duncans. Pulp from Nos. 2 and 4 to the vanners.

The ore worked contained sulphides of lead, zinc, iron and copper. Gangue principally quartz.

There was saved from the ore worked during the run of 694½ tons, $13.50 in value per ton in free gold by amalgamation in the batteries, and by running the pulp over silvered plates in the ordinary method used in gold mills.

After leaving the aprons, the pulp was run through the concentrators as described above.

I did not attempt to get at the value of the waste after leaving the concentrators, but made my comparison by weighing and assaying what was saved, with the following result:

From Duncan concentrators we saved 39½ tons of concentrates, containing—	
Silver, market value	$1,337 07
Gold " "	2,801 34
Total	$4,138 41
Also, amalgam that escaped the batteries, valued at	280 00
Total saved by Duncan Concentrators	$4,418 41
From the Frue Vanners we saved 34 tons of concentrates, containing—	
Silver, market value	$1,213 80
Gold " "	2,201 16
Amalgam saved, none.	
Total saved by Frue Vanners	$3,414 96
Difference in 694½ tons worked, credited to Duncans	$1,003 45

Yours truly, I. E. JAMES,
Sup't Carlisle M. Co.

"Tests of a similar character have in many cases, from one cause or another, been unsatisfactory, and without practical results. In the present instance, however, every opportunity was afforded for a fair and honest test of the merits and capabilities of both machines—such as would afford a basis of comparison that could be depended upon by parties in want of such information, and who have not had the opportunity of making a comparative test of the prominent machines in use. The conditions under which these machines were run, it will be seen, were such as to afford no possible advantage to either contestant, while the high character and standing of Col. James, who is well known as one of the most competent and successful mine managers in the country, is a guaranty of fair dealing, as well as to the correctness of the results." The report shows that five Frue vanners were worked against six Duncans. To avoid misapprehension, it should be stated that the cost of the six Duncans, set up in running order, was less than one-half that of the five vanners, indicating not only an advantage of nearly 30 per cent in results in favor of the Duncan, but a saving of at least one-half in the original outlay, as well as the labor and repair account largely in favor of the latter.

"Another fact of great significance is shown in the item of $280 credited to the Duncan for amalgam saved that escaped the batteries, making 7½ per cent of the entire amount returned by them, while none whatever was saved by the Frue. This difference would alone pay a large interest on the cost of such a plant, while the entire saving over and above that returned by the Frue would pay for the whole number of concentrators used at least ten times each year. When it is considered that the Frue vanner is claimed to be the best machine of the kind in use, the results here shown are most remarkable, and clearly indicate great progress in the direction of effective and economical ore reduction. The ores of the Carlisle Mine, as will be observed by the report, are of a very rebellious character, and calculated to test severely the close working and efficiency of any concentrator. The result is therefore all the more conclusive as to adaptation of the Duncan to all classes and combination of ore that can be treated by this process. While having no direct interest in any machine, method or process relating to mining, we record with pleasure the success of any invention that is calculated to assist in the material prosperity and development of this great industry."

A DISPATCH from Victoria (B. C.) says: The latest from Lolita creek, Skueena river, reports mining good. One man, it is said, has taken out by crevicing $688 inside of six hours. Some seventy men are mining on the creek, and ten companies. They are making good pay—$100 to the hand. The gold is coarse and spotted, averaging $16.75 to the ounce. The season commenced in July.

RUMOR says that the Hanby mine, near Douallon's bridge, in Calaveras, has been sold for $10,000. The mine is on a ranch, and in order to get the mine the purchasors were obliged to buy the ranch also, for which they paid $2,700.

CORRESPONDENCE.

Cliff Dwellings of Cosnino Canyon.

Last week we visited a noted canyon of cliff dwellings near Flagstaff, Arizona, seventeen miles distant from the southern base of the San Francisco mountains. Nothing in this wonderful country thus far explored proves so startling to us at first sight as cliff ruins. You drive along an excellent but new road through a noble forest of pine, beyond which at length you catch occasional glimpses of the opposite side of a rock-ribbed gorge. Presently you are near it, and gazing down over ledge after ledge of horizontal strata into its awful depths. As the eye sweeps along from side to side searching the crevices under each ledge, the vision reaches another and another of the strata, when at last a ledge jutting out a little more than its fellows is reached, and there under it, shining in the sunlight like a row of mud wasps' nests, on a brick underpining, is a white wall of masonry pierced at intervals with square apertures leading to dark enclosed recesses.

We were soon carefully letting ourselves down along a nearly vertical rent, conveniently crossing the strata at this point, to find a ledge immediately under our starting place, exhibiting the masonry described and at last we stood in the presence of its wondrous ruin.

No sign of foot-path, much less a wagon road led up or led down to the spot, but there, built up under the overhanging stratum of smooth limestone, were strong walls, eighteen inches to two feet thick, and many yards long, snugly embracing the outwardly curving ceiling, and enclosing large and convenient rooms, separated by thick cross walls and floored with hard level cement; evidence, all things considered, of determined, concerted, skilful, arduous and successful labor performed, who knows when, by a populous colony of, who knows whom, by means of, who knows what? There cling the little cages wedged into the crevices and thickly studding several benches, one above the other, on both sides of the long, deep, winding canyon, with ledge upon ledge jutting out above these same strongholds, and ledge upon ledge jutting out below them; a thousand feet up to the trees, a thousand feet down to the water! *How came they there? And what for?*

We took some excellent photos of a ruin near at hand, and of two distant amphitheaters, and sometime an extended article must be written: it is impossible now, we are too tired and too distracted with trying to catch the abundant and strange flora as it passes.

J. G. LEMMON.

Fort Marion, Arizona, July 2, 1884.

A New Safety Lamp.

We have received a sample of a convertible safety lamp recently designed, and now placed upon the market by Mr. R. E. Astley, of Croxdale. The leading feature of the invention is the combination in the lamp of the Mueseler, Davy and Clanny principles, and the means of readily converting it into a lamp of either type at will, so suiting it to the varied requirements of mining operations. By the simple removal of a cone the lamp is adapted for general work on engine planes, for drivers, putters, wagon-way men, and men traveling in the returns or working waste work. Removing the cylinder and cone and inserting the top gauze, it produces a protective Davy lamp for testing for gas, such as is required by managers, overmen, and deputies, who do not require an open lamp to fire shots. Again the removal of the bottom gauze and the replacing of the cylinder and cone furnish a lamp that will give, the inventor claims, a light equal to any other glass lamp. It is a Mueseler lamp, but safer, Mr. Astley says, because there is no gauze to damage with a pick, etc., and so long as the glass is good the lamp is safe, which in an ordinary Mueseler lamp is not so, because the glass may be sound and safe but the gauze damaged and the lamp unsafe. Mr. Astley claims the following excellences for his invention:—Combined it is a lamp well suited for miners generally, and can be used in long-wall or broken workings where it is not safe to use a lamp depending for safety on the glass only. If the glass should break the lamp is safe, the gauze protecting the flame as in an ordinary Davy lamp; without the bottom gauze it is a lamp better in point of safety, sensitiveness and general adaptability, and having less gauze than any lamp at present in use; without the cylinder and cone, but with the top and bottom gauze, it is a lamp well suited for managers, overmen, deputies, and others who require a lamp to test for gas, the glass protecting the flame from the current: the safety of a mine is in proportion to the sensitive properties of the lamp in use and the number of square inches of gauze to which the flame is exposed. Mr. Astley also claims for his lamp that it is self-extinguishing on exposure to gas. It certainly is ingeniously designed, and by a man who knows by the experience of everyday life the precise requirements of such an invention; we do not doubt that it will receive attention from those for whose service it is produced.—*Colliery Guardian.*

Washington Territory Mines.

The Kittitas Mining Region.

A correspondent of the *Calico Print*, writing from Ellensburg, W. T., gives some interesting facts concerning the Kittitas mining region in that territory:

The Cle-elum mining district comprises the mineral lands lying east of the summit of the Cascade mountains, and generally speaking, that between Mount Stuart upon the east and the Snowqualmie pass on the west. The discoveries thus far made yield gold, silver, nickel and copper, and may probably be called the smelting ores. Prospecting accomplished to date has covered but a very limited scope of the district, and that only upon the surface. The principal properties now under location are the Copperhead, Bullion, Centennial, Black Honeycomb, True Fissure, and what is called the Hawk. These prospects are well defined upon the surface and yield by different assays from $17 to $400 per ton, in about equal proportions of gold and silver, 3 to 80 per cent copper, a trace to 36 per cent nickel, and $2 50 to $2,000 in silver. Last season having been principally occupied in tracing these lodes and making proper locations. But little is known of the character of these ores at any depth, except as in the case of the Bullion, which at 10 feet has changed from $3 50 silver and 80 per cent copper to 40 per cent copper and 13 per cent silver sulphurets. A huge magnetic iron lode runs through the entire district along side or in proximity to what is known as the red or porphyry formation, and between these the Copperhead lode has been traced from the Cle-elum river six miles northeast to contact with the granite formation at Mount Stuart. At several intervening points the Copperhead comes squarely to the surface, always with black oxide of copper on top and developing into what is called by some copper glance and by others gray copper, at limited depths. There is all along this lode at different points croppings sufficiently massive to run an ordinary smelter for years, and but little doubt exists as to the early development in this district of not only a rich but permanent smelting camp.

Centrally speaking, the Cle-elum District is distant but fifty miles from Ellensburg, the county seat of Kittitas county. Washington Territory, which is 150 miles from the Dalles, Oregon, its present river connection, and but 40 miles distant connection with steamboats at Priest's Rapids, the head of navigation upon the Columbia River. Between the Cle elum mining district and Kittitas valley are the Peshastin or Swank mining districts, as also the recently discovered Tenaway coal fields. In the former district one six-stamp mill and three arastras have been running for some six years upon gold-bearing quartz which has averaged from $20 to $30 per ton in free gold. Thus far the property has been in the hands of inexperienced persons, who have kept upon the safe side and have been content to work the ores for the free gold, while the richer sulphurets have gone down the creek. This season they put up a new mill with more complicated machinery for working the base rock, and for once the discovery owners have sunk upon their properties to a sufficient level to give them a full year's run overhead in their mine. Peshastin district is 40 miles distant from Ellensburg. In the Swank district, which is but 25 miles distant from the same point, the principal developed quartz property is upon a reddish formation running through the entire district in slate, and developing at several points into veritable mountains of quartz. Immediately upon the Homestake lode lies what are known as the Swank placers. From one creek claim some $50,000 is estimated to have been taken and from the contiguous high bars nugget gold has been drifted out weighing in single instances as high as $250 and $700. $1,100 in wire gold was taken from a single crevice in one of the high bar claims, and a man can make from $2.50 to $4 per day in the ground drifting for the coarse bed rock gold alone.

Three reasons have prevented the previous wholesale working of these high bars. First, the gravel is from eight to thirty feet deep and pay only being found in the gravel where the wash is extra heavy. Ground sluicing would not pay enough more to supercede the drifting process. Second, to procure and carry out water for hydraulic washing was considered almost an impossibility. Third, men working the creek claims would not allow the high bar locators to tail into the creek, thus making it necessary to "crib up" their tailings, which debarred the profitable use of water for even ground sluicing purposes. A company having succeeded in securing the creek ground for dumping purposes, and having secured a number of high bar locations, a survey was made and found that four miles of ditch or flume will bring water in abundance 150 feet above these locations, and after used at that point can be carried upon a body of hydraulic diggings in Kittitas valley. Of Kittitas valley I have already written you. Grain and all ordinary crops can be excelled nowhere either for certainty or yield per acre. In the valley are perhaps 2000 souls. Throughout the county several other important settlements are springing up. Ellensburg is temporarily and in all probability permanently the county seat. Four general merchandise houses, several lesser establishments, two newspapers, a national bank, a good hotel, etc., are the leading local features. In the county are five grist and sundry saw mills. In the county are perhaps 30,000 people. When afforded an outlet our population will be greatly increased. Climate very healthful; hot in summer but tempered by wind; cold in winter but rendered agreeable by continual calm, which enables us to make the most of two or three months' sleighing at our disposal. All natural advantages are yet untouched for the reason that under existing transportation conditions, we are not able to help ourselves. We have now two crops on hand and farmers are putting in a third. This is done upon the strength of the expectation that the Cascade division of the Northern Pacific Railroad will reach the valley soon. Should this expectation not be realized we will have to look to the Columbia River for an outlet.

Hoisting Appliances and Round Wire Rope.

From an exhaustive article on the subject, by R. J. Frecheville, of Cornwall Devon, we make the following:

Of all mining operations, none is more important than that of winding, or has undergone more changes and improvements during the last quarter of a century, especially in the coal-fields, where, in consequence of the increased depth and enormous output of the mines, great attention has been bestowed on this branch of mining engineering. In some instances, from 1,000 to 1,500 tons of coal are drawn from a single pit in a day, the cages running at a speed in the shaft of from 1,500 to over 2,000 feet per minute. This result is due, not only to the shafts being perpendicular, and powerful engines being employed, but also to the marked improvement of detail in the appliances used.

In Cornwall, the daily output of mineral through any single shaft seldom exceeding 100 tons, the rapid winding usual in collieries, is not required, nor indeed is it possible.

First of all, as pointed out by Capt. Charles Bishop, in his excellent paper read before the members of this Institute, in 1882, entitled, "On the Importance of Drawing in Deep Mines," too much care cannot be exercised in the construction of the skip-roads, and in putting in rolls of sufficient size to break the angles, those used in most of our mines being almost invariably too small. These skip-roads should be examined in every part at least twice every twenty-four hours. There is no doubt that our winding engines do not meet the ideas of modern practice. Their first cost and expense of erection are excessive. They are, besides, clumsy to handle. The type that has found favor in other districts is a double-cylinder, high-pressure engine, fitted with variable expansion and reversing gear, the pistons connected directly with the fly-wheel shaft, on which also are the drums and a powerful brake, worked by means of a counterpoise, or, better still, by steam, and capable of stopping the machinery instantly.

It is important that there should be a good lead from the drum to the pulleys. The angle made by the portion of the rope between the drum and poppet heads, and the portion hanging down the shaft should, if possible, not be less than 60 degrees. Another condition to be observed is to place the drum and its corresponding pulley in the same vertical plane. The pulleys for guiding the ropes should run loosely on their axles, so as to have a little lateral play, and be provided with a guard to prevent the rope from slipping. As Captain Bishop has remarked in the paper above referred to, there should never be such a thing as a hold-down pulley. The diameter of the drums and pulleys should not be less than one foot for every one-eighth inch diameter of the rope, and, in the case of ropes made of large wires, this proportion should be increased. The pulleys should be as light as possible, and of the same size as the drums, as it is not well to have a different strain on the rope, at the pulley from that at the drum. In the best constructed pulleys the central boss and rim are of cast-iron, and the arms of wrought-iron. The groove in the pulley should be lined with wood on end, and be sufficiently wide and deep to afford the rope a certain amount of play. The drum commonly used is the cylindrical one built of iron, with wood lagging bolted on to the metal work, thus forming a cushion for the rope to lie on. All bolts should have their heads carefully counter sunk. There should always be several coils of rope on the drum unwound, so that the rope cannot become unfastened.

The pulley frame or poppet heads should be well stayed and sufficiently strong to resist any strain that may be brought to bear on it. A hight of thirty feet with a slow winding of from 250 to 300 feet a minute, usual in Cornwall, is a sufficient margin for the engine-man when a reliable indicator is attached to the machinery. With this slow rate of speed, the adoption of any further appliances to prevent overwinding, such as safety or detaching hooks, is hardly required.

The rope to be used is a matter of the first importance, especially in those cases where the security of human life is dependent on its efficiency. The essentials of a good rope are flexibility and strength, combined with the least possible weight. Experience has shown that in the majority of cases these requirements are best fulfilled by round steel wire ropes. Iron wire ropes are fast going out of use, owing to the larger sizes required for given strengths, with consequent increase of dead weight to be subtracted from the useful load. It must, however, be borne in mind that, where the mine water contains much acid, the injurious effect of this on a steel wire rope would be greater than on an iron wire rope.

Too great stress cannot be laid upon the necessity of having ropes constructed of the best material. The selection of the material, however, somewhat depends on the conditions of working. Thus, with a perpendicular shaft and large drums and pulleys, a plow-steel wire rope will be found the most reliable; but with small drums and pulleys, and a shaft with angles in it, a rope made of best patent steel or mild steel will last longer, as the wires are not so apt to snap in bending. In describing a wire rope, the number of strands, the number of wires in each strand, their gauge, the quality of metal, and the material of which the center or case is composed, should be specified.

Now, as to the gauge, since the ultimate strength of wire increases as its diameter decreases, and since small wires are more pliable than large ones, it would seem that the finer the wire used the better; but there is a practical limit to this, as very fine wire offers too much surface for oxidation, and is too easily injured by friction. Experience has shown that it is advisable to employ medium sized wires, between Nos. 10 and 15 of the Birmingham wire gauge. For ordinary work, hemp cores or centers have been proved the best. They stretch with the strands, allow the wires to bed themselves solidly, and give ropes greater flexibility than could be obtained with wire centers. The latter have not given very satisfactory results in practice, although a greater breaking strain is obtained with a relatively smaller rope.

On account of many different varieties of steel wire employed in the manufacture of rope, and the varying sizes of the hemp centers, and the empty spaces, it is impossible to state a formula for determining the dimensions of a steel wire rope required to bear a given strain, as the nature of a wire rope, however, is defined by the number and size of the wires, it is easy, if we know the section and weight per fathom of the gauge employed, to determine the effective sectional area of the rope and its weight per fathom given, then, the quality of the metal, the breaking strain of the rope can be approximately estimated.

As the operations of manufacture introduce so many elements of uncertainty in wire ropes, it is well to allow a wide margin of safety, especially where their breakage would endanger life, and take the working load at 1-10th of the ultimate strength or breaking strain. The weight of the rope hanging over the pulley at the poppet-heads is of course included in the working load. In very deep mines, this weight, even with steel wire ropes, becomes a matter of such serious consideration that tapering ropes have to be used. In the case of a rope working at a very slow speed, such, for instance, as a capstan rope, a larger factor of safety than 1-10th may be adopted.

Nevada Resources

In an interview in New York with George W. Cassidy, editor of the Eureka *Sentinel*, the *Mail and Express* reporter elicited the following points: It has been generally understood in the East that since the productive bonanza mines have failed, Nevada had deteriorated in population and in wealth to such an extent that she was unable to support a State government, and that the property holders would ask that she be reduced to a Territorial condition. In answer to this Mr. Cassidy said: "There is no such talk or feeling in Nevada. While our State rate of taxation is not oppressive we have in the treasury about $700,000, and we do not owe a dollar. What other State can make this showing? I see the bonds of your States quoted daily in the Wall street market. We have never cost the other States or the Federal government one cent. Neither do we get a dollar for alleged river and harbor improvements, and other jobbery, though we are taxed to foot these outlays for the other States. Nevada has contributed from her mines one thousand millions of gold and silver to uphold the credit of the nation. In all respects we are in a better condition than those who traduce us. In proportion to population we name a less number of illiterate people than any other State, and the percentage of crime and drunkenness is less.

"It is not true that we are losing our population; on the contrary we are gaining in all directions. Nevada was admitted into the Union in 1864 with a total population of less than 30,000. In 1870 we had 52,000, and according to the census of 1880, 62,000. The State embraces 111,000 square miles, being as large as all New England, New York and Ohio combined. The compensation allowed for taking the Federal census will not pay for horse feed in that country; so one-third of the people are never reached.

"Mining is hardly as prosperous as formerly, but our people are giving more attention to stock raising and agricultural pursuits than in the past. There are six fertile valleys in the State, any one of which is as large and productive as the largest of one of the New England States. Mining will be carried on profitably for a century to come."

THE estimate of the Department of Agriculture of the wheat crop for this year is about 485,000,000 bushels.

MECHANICAL PROGRESS.

Wire Gauze Stove Doors.

The person who ten years ago, says the *Age of Steel*, would have recommended a well-ventilated stove oven to the kitchen workers would have been set down as an unconditional fool in the school of cookery. People who have never cooked except in closed ovens cannot be persuaded except by actual demonstration of the fact, that bread and meat can be cooked perfectly in an oven wherein the heat is being constantly displaced by fresh atmospheric air. They are inclined to ridicule the idea because of its radical departure from established custom and popular conviction. But, nevertheless, the ventilated oven is coming into wider use; and it is this which compels attention.

The ventilated stove oven is with us no hobby; our attention has been drawn to it by the experiments which a large stove manufacturing company has been carrying on; these have satisfied us of its value, but have not convinced us that it is our bounden duty to hammer other people into our way of thinking. Our interest in the new invention is of that impartial kind which declares for fair play and then abides the result.

The wire gauze door is, we believe, the only method yet hit upon by the friends of ventilated ovens for admitting the fresh air, though we understand an Eastern manufacturer proposes to bring out a stove in which the draft will in some way be made direct from the oven to the flue, and from the outside into the oven, in a new and unexplained manner. With the wire gauze door the hot air escapes through the upper part of the door and the cool air flows in through the lower part, according to natural laws. The result is the bottom of the stove upon which the cooking is done is kept comparatively cool. One would think that even with a good fire going it would be difficult to bake bread or roast meat. But it is not, and the hot air escaping from the oven need cause no alarm.

One advantage claimed for the ventilated oven is that it prevents a great wastage of the moisture contained in the meat or whatever may be cooking, and thus insures tenderness as well as greater weight. In the closed oven experiments show that a piece of meat loses 30 to 40 per cent of its weight, if well cooked, by absorption. In the ventilated oven the loss has frequently been as low as 10 per cent, and rarely, if ever, in excess of 15 or 20 per cent. In other words, it appears that the meat in the closed oven is dried rather than cooked, and is made the tougher because of its treatment. The originator of the wire gauze oven doors, it may be said, declares that he can take the cheapest and toughest steak in the market and cook it in the ventilated oven, with the result of making it as tender and juicy as the best porterhouse. He is emphatically of the opinion that meats cooked in the oven are made tough and indigestible by the dry heat, which robs them of all moisture.

Welding Fluxes.

We do not know that the following welding fluxes are any better than the welding material used generally by watch makers and silversmiths, but they have been patented in England, so we publish them.

1. A welding-material composed of 25 parts by weight of borax, a paper or metallic support, and 60 parts of metallic filings of the same nature as the metals to be welded, and made by first melting the borax; second, immersing the support in the fused borax; third, smoothing the same by passing it through pressure rollers; forth, sprinkling its two faces with the metal filings; fifth, heating the sheet in an oven; sixth, passing through pressure rollers.

2. A welding material composed of borax and of metallic filings of the same nature as the metals to be welded, mixed with the fused horax, and in the proportions substantially as set forth, and then rolled out into sheets of about one sixteenth of an inch thick.

3. The welding sheets coated with a layer of gum lac or other appropriate varnish.

The following compound has been frequently offered as a trade secret: The copperas, 2 oz.; saltpeter, 1 oz.; common salt, 6 oz.; black oxide of manganese, 1 oz.; prussiate of potash, 1 oz. Pulverize these ingredients and mix with them 3lb. of nice welding sand.—*Scientific American.*

Lathe Feeds.

For many years our tool makers have almost universally discarded other feeds for lathes for the screw. Forty years ago, and later, the chain feed was a favorite for all work on the lathe but screw cutting. It had its advantages. So had the rack and pinion feed. Both these feeds took hold of the tool carriage midway between the V-ways, the proper point to avoid a diagonal strain. The rack protected its teeth and those of its pinion from falling chips and dirt, and it could be instantly reversed without much backlash. With it the carriage could be run from end to end of the bed between the heads very rapidly. In fact, many of the screw feed lathes of to-day have their run-back or traversing movement by means of a gear engaging with the threads of the screw, which thus serves as a rack.

As the best of toothed racks and gears are now cut, there is no need of any backlash; the epicycloidal curve to form the contour of the teeth insures a perfectly free rolling action, without looseness. Such a cut rack with pinion or wheel would be just as accurate for the finer qualities of lathe work as the screw; and with properly arranged gearing such a feed could be used in screw cutting. In fact there would be some advantages for some jobs in having a rack and pinion feed instead of the present screw feed. If there should be fear of sufficient wear of the teeth by use to create a backlash which might affect the integrity of the proposed screw, a double-disk pinion would obviate this fault.—*Scientific American.*

PROGRESS IN ARTILLERY.—Scarcely 25 years ago the most powerful piece of artillery was a 68-pounder, throwing its projectile with a velocity of 1,600 feet per second. Now the weights of guns have been increased from 5 to 100 tons, the velocities from 1,600 to 20,000 feet per second, the energies from 1,000 foot-tons to over 52,000, and the projectiles from 68 pounds to 2,000 pounds. But, enormous as these attainments are, expressed in figures, the highest or greatest are as nothing when compared, as some one has remarked, with those of the projectiles, velocities and energies existing in nature. Basing the estimates on the principles laid down by Helmholtz, if the earth, for example, be considered as a huge projectile, and if it could be possible to utilize the whole of the energy stored up in gunpowder, there would be required a charge 150 times greater than its own weight and 900 times greater than its volume to impart her orbital motion to the earth.

THE PERFECT SCREW.—Professor W. A. Rogers produces a perfect screw by the following process: An ordinary well constructed lathe is used; and cuts of various depths are taken on a preliminary screw, for the purpose of tabulating the errors of the leading screw of the lathe as compared with a standard measuring bar. This being done, a micrometer screw is used to vary the relation between the leading screw and the cutting tool. This screw is kept moving automatically, or by hand, so as to always correspond with the tabulated values, which results in producing a screw nearly free from the errors of the leading screw. This screw is then ground with a nut cut in the same way: and, if not sufficiently perfect, it is then put in the place of the leading screw, and another screw cut from it by the same method, whereby any remaining errors are eliminated.

LIME IN BRICKS.—Many bricks become spoiled when they are made from clay which contains lime in such quantity that, after burning, the lime becomes hydrated sooner or later, and thus renders the brick useless. This may be prevented by placing the bricks, as soon as they are removed from the oven, when they are still warm, in a hole or tank piled on each other, and throwing water over them so as to cover them entirely with water. A few hours afterwards, when bubbles no longer come to the surface, the bricks can be taken out of the water. By this operation the slaking of the lime, which takes place in bricks not thus treated by the slow absorption of the humidity of the air, is prevented, as the lime is modified by this operation.

A STEAMER TO RUN UNDER WATER.—There is being built at the Delamater Iron Works an iron steamboat designed to run under water. It is 30 feet long, 7½ feet broad and 6 feet deep. Water ballast under control of the crew will enable them to sink or float her, and by the device of two rudders whose planes are at right angles to each other, she can be pointed in any direction. The usual outfit of electric engines, compressed air and diving suits, with which readers of Jules Verne are familiar, is included in the design. In war times she can also be used as a torpedo boat.

ROLLING MOLTEN IRONS.—A rolling mill has been devised for rolling molten iron or steel in a liquid state. According to this, the rolls are cast hollow, so as to receive a current of water, which will maintain a sufficiently low temperature, and the metal is to run from a "hopper" or distributor and fall between the rolls, becoming cooled on contact with them. The effect of this process, it is said, is to free the metal entirely from gases.

PURITY AND CRYSTALLIZATION.—The characteristic sign of purity in metals is their power for crystallization—the purer the metal the more ready and perfect the crystallization, and the less is its cohesive strength. Zinc when quite pure cannot be rolled into sheets, but when mixed with a small percentage of lead it becomes very ductile. Gold has to be alloyed with copper or silver to make it suitable for use in arts or commerce.

THE TENSILE STRENGTH of a cast-steel bar is 140,000 pounds, wrought iron bar 50,000 pounds, malleable cast-iron 25,000 pounds per square inch. Small steel castings can be annealed in the same manner as steel forgings, by heating to a full red, covering with hot ashes, allowing three or four hours to cool.

THE FIRST IRON PLOW.—The first cast-iron plow was made in 1797 by Charles Newbold, of Burlington, New Jersey, who spent $30,000 in perfecting the implement.

SCIENTIFIC PROGRESS.

How Petroleum Tanks are Fired By Lightning.

The great destruction of petroleum in oil storage tanks through strokes of lightning, is calling the attention of scientists and practical men to the necessity of learning how the lightning is directed to the tanks and what can be done to avert the danger. During the months of May and June last, no less than seven distinct and separate occurrences of this kind occurred in the oil regions of Pennsylvania, with an aggregate loss of 188,300 barrels of oil, involving a pecuniary loss of about half a million of dollars. Mr. Thomas H. Walton, writing to the Philadelphia *Record*, thus explains the peculiar attraction which petroleum tanks manifest for lightning:

Light a tallow candle and let it burn till it requires snuffing. Don't snuff it, though; but light another candle. Get into a still atmosphere and put out the first candle, leaving the long snuff. A column of smoke will arise from it. At a height of several inches in this column of smoke put the flame of the lighted candle. You will see a messenger of flame decend through the column of smoke and relight the lower candle. Well, what of this? Simply let us change the candles into some other inflammable substances. Let the lower one be an oil tank, containing 20,000 or 40,000 barrels of coal oil. Let the upper one be a cloud charged with a superabundance of electricity, which is becoming released by flashing to the earth while the barometer is dropping very rapidly. What then? Coal oil under certain atmospheric pressures will contain a certain quantity of carburetted hydrogen gas. If the atmospheric pressure should suddenly become reduced, then the body of gas in the oil, being relieved of a certain amount of pressure, will expand. A proportionate quantity of the gas will get out of the oil and into the air, mixing with it in a corresponding ratio. The body of air receiving this gas to the extent of four per cent will take the fire of electricity and ignite with the violence of an explosion; and the body of air receiving such a light gas will form itself into a column and ascend from the tank to the clouds in an invisible stream. We do not need to be told of the result if the clouds are low, and are also flashing fire from them. To avoid accidents from lightening, the tanks should be thoroughly ventilated, so that the air on the surface of the oil will be so pure as not to contain more than one-half of one per cent of the coal gas. If covers are used on such tanks they hinder the gas from escaping freely as it forms; and then on the surface of the oil there will be an atmospheric explosive mixture, requiring only the presence of a flame of any kind to start a conflagration.

A Polar Tempest.

It is impossible to form an idea of a tempest in the polar seas. The icebergs are like floating rocks whirled along a rapid current. The huge crystal mountains dashed against each other, backward and forward, bursting with a roar like thunder, and returning to the charge until, loosing their equilibrium, they tumble over in a cloud of spray, upheaving the icefields, which fall afterwards like the crash of a whiplash on the boiling sea. The sea gulls fly away screaming, and often a black, shining whale comes for an instant puffing to the surface. When the midnight sun grazes the horizon, the floating mountains and the rocks are immense in a wave of beautiful purple light. The cold is by no means so insupportable as is supposed. We passed from a heated cabin at thirty degrees above zero to forty-seven degrees below zero in the open air without inconvenience. A much higher degree becomes, however, insufferable if there is a wind. At fifteen degrees below zero a steam, as if from a boiling kettle rises from the water. At once frozen by the wind, it falls in a faint powder. This phenomenon is called sea smoke. At forty degrees the snow and human bodies also smoke, which smoke changes at once into millions of tiny particles, like kneedles of ice, which fill the air and make a light continuous noise, like the rustle of a stiff silk. At this temperature the trunks of trees burst with a loud report, the rocks break up, and the earth opens and vomits smoking water. Knives break in cutting butter. Cigars go out by contact with the ice on the beard. To talk is fatiguing. At night the eyelids are covered with a crust of ice, which must be carefully removed before one can open them.

Changing the Color of Flowers.

Our knowledge of the chemistry of vegetable pigments is not yet sufficiently advanced, for which reason the effect of artificial influence upon the color-tone of flowers has not yet received its merited attention. According to my view, tannin is an important factor in the generation of vegetable colors. It is found in almost every plant, the petals not excepted, and by the action of the most varying reagents—alkalies, earths, metallic salts, etc.—it assumes the most manifold hues from the pale rose to deep black. A darker color is produced in flowers rich in tannin, when manured with iron salts, dye black and produce ink. A practical use has been made of this fact in the raising of hortensias and dahlias. The former, which, in ordinary soil, blossomed pale-red, become sky-blue when transplanted into soil heavily manured with iron ochre, or when occasionally watered with a dilute alum solution. English gardeners succeeded in growing black dahlias by similar manipulations. It is well known to every florist that a change of location, that is a change of light, temperature and soil (replanting occasionally produces, new colors whence it may be deducted that an interrupted nutrition of the flower may, under circumstances, effect a change of color. We see no valid reason why the well authenticated fact of the change of color produced by manuring with iron oxide thereby changing the nutrition of the plant, should not be practically employed by the hothouse gardener.

Another very singular and successful experiment in producing a change of color in a bird has recently been made. A breeder of canary birds conceived the idea of feeding a young bird with a mixture of steeped bread and finely pulverized red Cayenne pepper. Without injuring the bird, the pigment of the spice passed into the blood and dyed its plumage deep red. The celebrated ornithologist, Russ, believes that the color of the plumage of birds might be altered according to desire by using appropriate reagents.—*Popular Science Monthly*

A distinguished botanist has found that by simply soaking the stems of cut flowers in a weak dye solution there color can be altered at will without the perfume or richness being destroyed. Most beautiful effects are produced by preparing lakes. Singular to say, flowers refuse to absorb certain colors, while they dispose of others in different manners. If placed in a mixed solution they make a complete analysis, and some lilies which had been treated with purple showed distinct red and blue veins, the colors having been divided in the process of absorption.

GARDENING EXPERIMENT — STIMULANTS FOR PLANTS.—A correspondent of the *Gardeners' Chronicle* has been making some interesting experiments in the use of special stimulants for plants, which are referred to as follows: "Last year I was induced to make an experiment in chrysanthemum growing, and for this purpose I bought one pound of sulphate of ammonia, which I bottled and corked up, as ammonia evaporates very rapidly. I then selected four plants from my collection, and put them by themselves, and gave them a teaspoonful of ammonia in a gallon of water twice a week. In a fortnight's time the result was most striking, for although I watered the others with liquid cow manure they looked lean when compared with the ammonia watered plants, whose leaves turned to a dark green, which they carried to the edge of the pots until the flowers were cut. As a matter of course the flowers were splendid. The ammonia which I used is rather expensive, as I bought mine from a chemist's shop; this year I intend getting agricultural ammonia, which is much cheaper. I have also tried it on strawberries, with the same satisfactory result, the crop being nearly double that of the others; it is very powerful, and needs to be used with caution.

A GENUINE MARBLE MANTEL, costing from $1,500 to $2,000, can be imitated in slate so perfectly, at a cost of from $40 to $50, that the most fastidious could have no choice between them. The process of marbleizing requires skill, but is comparatively inexpensive. The enameling is done on water and afterwards subjected for a time to heat, at a temperature of 300°; this makes it as hard as flint, bakes it into the slate, forming a smooth, bright, glazed surface, which is not acted on by acids or grease. The durability of this surface has scarcely been tested; marbleized mantels have been in use thirty-five years, without showing any signs of the surface cracking or wearing, or of its losing its color and luster.

THE CULTIVATION OF FLOWERS is now urged from a purely scientific basis, especially in low or unsavory localities. The perfumes of many or most flowers convert the oxygen of the air into ozone, which has a powerful oxidizing effect upon decaying matter, and is therefore of great economy in matters of health. The most odorous flowers should be planted for this purpose, such as mignonette, alyssum, heliotrope, perennial pinks, lilacs, etc.

GAS VERSUS ELECTRICITY IN LIGHTHOUSES.—The experiments carried on at South Foreland, England, detailed at some length in the *Journal* of July 2d, in regard to gas, electricity and oil as agents for lighthouse illumination, appear to have settled the question that gas light is the one best calculated for use in decidedly hazy weather.

LONG DISTANCE TELEPHONING.—Conversation is carried on daily between New York and Boston through copper wires, which are reserved for experimental use exclusively. The *Electrical Review* says it is believed, before many months, commercial lines will be in use between several of the large cities of the country.

THE ELECTRIC DOT.—As the result of some very careful tests recently made, it is estimated that an electric dot travels at the rate of 16,000 miles per second, or 9,600,000 miles per minute. This is not quite up to the speed of light, which travels 12,000,000 miles per minute.

TABLE OF CONTENTS.

EDITORIALS.—Ore Concentration, 113. Passing Events; Fastening Caps on Fuse for Blasting; Artesian Wells in Nevada; Ambulances and Mining Accidents; Emery, 116. Shaft-Sinking by Freezing, 117.
ILLUSTRATIONS.—The Duncan Ore Concentrator, 113. The Poetsch System of Sinking Mining Shafts by Freezing, 117.
CORRESPONDENCE.—Cliff Dwellings of Cosnino Canyon, 114.
MECHANICAL PROGRESS.—Wire Gauze Stove Doors; Welding Fluxes; Lathe Feeds; Progress in Artillery; The Perfect Screw; Lime in Bricks; A Steamer to Run Under Water; Rolling Molten Irons; Purity and Crystallization; The First Iron Plow, 115.
SCIENTIFIC PROGRESS.—How Petroleum Tanks are Fired by Lightning; A Polar Tempest; Changing the Color of Flowers; Gardening Experiment; Gas vs. Electricity in Lighthouses; Long Distance Telephoning; The Electric Dot, 115.
ENGINEERING NOTES.—Ericsson's Solar Engine; An Immense Cantilever Bridge; Steamship Speed; Skillful Engineering; The Largest Engine, 119.
USEFUL INFORMATION.—Dark Leather; Spontaneous Combustion; A New Application of Oil for Stilling Rough Water; Tinning a Soldering Iron; Oil for Preserving Beer; Chewing Gum; Consuming Smoke; Gold Coin; The Electric Light Danger; Linseed Oil a Preservative of Seals, 119.
GOOD HEALTH.—How Nature Benumbs Pain; To Remove Foreign Bodies from the Eye; The Length of Lines of Type; Purity of Sea Air; M. Pasteur's Hydrophobia Experiments; Sickness and Labor; Smoking and Blindness, 119.
MISCELLANEOUS.—A New Safety Lamp; Washington Territory Mines; Hoisting Appliances and Round Wire Rope; Nevada Resources, 114. Montana Mining; History of the Steel Square; The Little Shops and Their Influence; San Francisco Manufactories; Smoke Abatement, 118.
MINING SUMMARY—From the various counties of California, Nevada, Arizona, Idaho, Montana, New Mexico, Oregon and Utah, 120-1
MINING STOCK MARKET.—Sales at the San Francisco Stock Board, Notices of Meetings, Assessments, Dividends and Bullion Shipments, 124.

Passing Events.

From the mining regions there is little news of moment, aside from what we report in our usual summary of mining news for the week. There is some little excitement about the New River mines, in Humboldt county, in this State, but it is mainly local. All the flurry about the Coeur d'Alene mines seems to be over. The men who remain in that part of Idaho are only a portion of those who went to the new mines. It will take money to develop many of the claims of that region.

The strike in the Quijotoa mines, in Arizona, is making some talk, but has created no special excitement. The recent strike in the Stafford mine, belonging to the Sweetwater Co., at White Pine, Nev., has again attracted attention to that once famous camp. The strike is believed to warrant expectations of another bonanza.

Politics are taking up a great deal of attention in these days, and general business matters are somewhat dull in consequence.

THE dispute concerning the jurisdiction to which the Coeur d'Alene mining region belongs was decided recently by Judge Buck in favor of Shosbone county, I. T. The honest miner will now have to go to Pierce City for county seat business.

Fastening Caps on Fuse for Blasting.

If miners generally will pay careful attention to fixing their caps on the fuse when blasting with high explosives they will get much better effect from their blasts than is always the case. Very few appreciate the importance of this point, and it is the object of this article to explain it.

It is a common custom to secure the cap on the fuse by pinching the cap-shell or by biting it between the teeth—a dangerous practice, which has resulted in a number of accidents. Other miners simply push the cap on to the end of the fuse, thinking that as long as it does not fall off the result will be the same. But this is not the case. The more firmly the cap is pinched on to the fuse the better the detonating effect of the fulminate of mercury in the cap, and the more complete and sudden the decomposition of the powder. This has been fully proven by careful experiments.

Some time since complaint was made by Eastern purchasers of caps made here, that they did not get good results. Some of the caps did not go off, and others did not do the execution expected. The local makers were puzzled at this, as there were no complaints here, and experiments were made to find out the cause.

It was found, in the first place, that Eastern and European fuse was somewhat smaller than that made here. The caps made to use on California fuse, therefore fitted loosely on the Eastern fuse, and when the cap was fired, sometimes even the shell was not broken. In others the fire would burn down slowly until heat enough was developed, when the cap would explode, but with comparatively small effect. In fact, though paying for a triple-force cap, they were only getting the benefit of a single-force one. This led to a lot of other experiments about loose caps on the fuse. They resulted in proving that a cap not properly secured to the fuse lost something more than half its power. They found that a double-force cap, well secured, would do almost as good work as a triple one. It is therefore urged upon all users of such caps to secure the cap well with suitable nippers, of which there are several kinds in the market. The nippers cut the fuse, point it so it will go in the shell easily, and also forcibly nip the upper end of the cap-shell on the fuse, so there can be no escape of gas. This makes the caps waterproof, also. So well is this understood by some mining men that special people are employed to prepare caps and fuse for miners. Superintendent Patton has a boy who does nothing else at the mines in his charge, and it is found to pay well.

When the fuse is too small, or the cap is fitted loosely and not squeezed on, the cap loses from 30 to 60 per cent of its force. The gases escape from the cap or shell alongside the fuse. The fulminate of mercury in the shell requires "tamping," so to speak, just like nitroglycerine and other powders, to give its best effect. Anyone can try this by unwrapping one of the tapes from a piece of fuse, which reduces its size; then put on the shell. The fuse "spits" ahead and will sometimes blow the cap off without firing it; and when it does fire it a comparatively small effect is given.

One of the experiments to prove this was made with a piece of one-sixteenth wrought-iron plate. Where a cap was simply pushed on to the fuse loosely and fired, very little impression was made on the plate. When the cap was pinched tightly on to the fuse, so its contents were confined, a round hole was blown clear through the iron by the cap. Caps and fuse were, in each instance, of the same make.

It is well understood that the more powerful the explosion on the high-grade powders to discharge them, the better are the results, and it is in the interest of economy and good work that miners should firmly and tightly secure their caps on their fuse. There will be fewer mis-fires and better execution in blasting.

THE case of the Mono Gold Mining Co. against the Rustler Mining Co., in regard to the possession of certain mining land, which has been in the courts for five years, was settled this week. Some time since the demurrer of the Rustler Co. was overruled and no answer has since been filed. Judgment for the plaintiff in $20,000 by default has accordingly been rendered by Judge Sawyer.

THE local manager of the Lexington and Princeton Mining Companies of Butte, Montana, has left, it is said, with $10,000 of the Princeton's money.

Artesian Wells in Nevada.

A very deep well is being sunk at White Plains, Nevada, on what they call the 40-mile desert, in the neighborhood of the sink of the Humboldt. The well is being put down by the Central Pacific Railroad Co. as a test well, not alone for the satisfaction of obtaining water for their own use, but to determine the feasibility of getting it elsewhere on the line of their railroad, as well as in other parts of the State. The only good supply of water for the desert is brought from the Truckee river, 35 miles west of the new well on White Plains, and is hauled in tank cars for the supply of engines and domestic purposes, showing the necessity of testing thoroughly by artesian wells to get water. The desert contains many specimens of Indian curiosities—arrow heads, Indian mortars, etc., being formerly fine hunting grounds.

A record of the progress of this well will be of interest to many persons. They have found salt, water, hot water, and finally, at a depth of 1,650 feet, they came across wood. Mr. W. C. Chapin, who has charge of the drilling of the well, sent to the Academy of Sciences samples of the wood brought up by the drills, and gave a brief record of the material passed through in boring.

From the surface to 20 feet they passed through clay with a four inch stratum of fine decomposed quartz; then to 36 feet it was tufa and cement; then two feet of cobbles, sand and hard shells. At 38 feet they struck a strong stream of salt water in gravel; from 40 to 70 feet there was sand, cement with seams of rock and cobbles. This kept on until they reached 144 feet, when they met cement clay, with sand and gravel, which continued to 205 feet, when they met fine brown sand; then down to 300 feet there was cement, gravel, sand and shell conglomerate. From 300 to 340 feet compact sand or sand rock; to 367 feet various kinds of cobbles; then followed white tufa, fine sand, cement, sand and gravel to 400 feet. A stratum of conglomerate was then found, which passed into cement at 420 feet, where cobbles and gravel were met with, and then fine sand; at 486 feet bedrock was found. Eight inch driving pipe was driven to the depth of 486 feet, the part above this being all surface wash. From 486 to 520 feet was black rock, when red volcanic rock was met, continuing with slight change to 575 feet, where black basalt was found. At 595 feet there was red rock and red mud; then came black rock with seams of clay. From 625 to 635 feet there was a reddish-gray rock with cement, which mixes up with the water—red rock probably from above. Gray muddy rock then came in, and from 655 to 665 feet a reddish-brown sand rock; then a soft green rock. Between 666 and 685 feet there was very compact black sand, and then hot water was struck.

Between that point and 697 feet was reddish-black sand, changing to coarser below, when at 703 they found red rock again, which continued to 745 feet. From there to 950 feet was black, red and gray rock, in strata. From there to 1,000 feet, and to 1,040 feet, was red rock, fine and very hard. From 1,040 to 1,050 the rock was slate-colored. From that to 1,140 black (basalt), and then a red slaty clay, followed by blue clay (slate) and volcanic ash. The volcanic ash continued to 1,300 feet, when conglomerates and rock were met, lasting to 1,550 feet, when a soft, muddy, white rock came in, continuing to 1,610 feet.

From 1,610 to 1,615 feet was a fine gray sand, and from 1,615 to 1,624 was a stratum of *wood*. This wood is not silicified, but is black and hard, though it breaks readily when handled. Some large pieces were found. It is rather remarkable to find wood at such a depth, and so thick. Iron pyrites were found near by. Below this, again, is conglomerate, with some fine sand. At 1,825 feet very muddy rock came in, and also more sulphurets, followed by a soft, dark rock, very loose, and falling in on the drills. From 1,890 feet to 2,088 feet very hard black rock was met. The well is now down over 2,100 feet, but no water has yet been found, aside from that which is hot or salt, as mentioned.

The work of sinking is, however, being continued, with the hope of eventually striking a flow of water.

A FLOCK of wild geese, going south, passed over San Diego the other day.

Ambulances and Mining Accidents.

They have an association in England now, called the "Ambulance Association," which operates in the thickly settled mining districts. The object is to care immediately for persons injured by mining accidents, and where they occur, to provide for proper conveyance of the sufferer to a place where he may be properly cared for. It seems that in many instances where men are hurt they are injured by unskillful people carrying them. Ambulance material is provided in mining districts, and those injured are taken on suitable appliances, so they are not hurt worse by being carried on boards, shutters, or anything handy. In the coal and iron mining districts in Great Britain there are some 560,000 men and boys employed, and that one relief society alone in one year assisted 14,929 injured cases, and last year (1883) out of a total membership of 224,000 belonging to the various societies in the mining centers, no less than 44,379 cases of injuries were relieved. Lord Crawford and Balcarres, a high authority on these matters, stated at an ambulance meeting at Wigan some time ago, there could be no doubt that as many as 100,000 accidents, large and small, occurred throughout the mining districts of that country in one year. Surely, then, with so much pain and suffering to alleviate, there is abundance of good work to be done by proper means of carriage for the injured.

The association is intended to relieve pain and suffering among the mining population by assisting in the introduction of well-regulated means for the carriage of the injured everywhere among the collieries and iron works. An exhibit of ambulance material for this purpose was made at the recent International Health Exhibition, and attracted a great deal of attention.

Emery.

Emery and corundum are nearly allied mineralogically, though in trade they are sharply distinguished. Mineralogically, corundum is a nearly pure alumina, while the emery contains a very large proportion—from twenty to thirty-three per cent—of iron oxide. The trade distinctions are somewhat as follows: Emery is always black, while corundum is of various colors, though more frequently gray, and is never black. It is much harder than emery and sharper, cuts deeper and more rapidly, but is, on the other hand, more brittle and less durable.

Almost all our supply of true emery is imported. Many supposed discoveries of emery of good quality have been made, but all have failed to stand the commercial test. Magnetite, ilmenite and massive garnet are often mistaken for emery, and attempts have even been made to replace true emery for these substances.

For sometime emery was produced at the well known mine at Chester, Mass., but the material was found to be too soft, and the mine is now abandoned. It comes from Turkey, near Smyrna, and the island of Naxos. There are other foreign localities also, though none except from the places just mentioned comes to this country. We import annually into the United States, about 45,000 hundred-weights, worth about $58,000, of the crude emery ore which is found here, and about $30,000 worth of ground emery prepared in England. The average price of Turkish emery, ground in this country is, grain 3½ to 6 cents per pound. That of the best English ground is worth: grain, 10 cents per pound; flour, 8 cents per pound.

DURING 230 days the 30-ton smelter of the United Verde Copper Co.'s plant, Arizona, has turned out 2,300 tons of copper, or an average of ten tons per day. The aggregate contained about 175,000 ounces of silver. The company has paid $97,500 in dividends, besides paying for their plant and improvements and building roads, etc., with a large reserve fund on hand.

L. VARY, Justice of the Peace at Bartlett Creek, tells the *Silver State* that miners from California have discovered nickel mines out in the Black Rock country, which are said to be very rich. The ore is said to be exactly like that from the Cottonwood mines east of Lovelock.

MR. G. W. INGALL is authorized to take subscriptions for the MINING AND SCIENTIFIC PRESS at Phœnix, Arizona.

THE Bonanza King mine at Calico has reached a depth of 550 feet, and work is progressing on the seventh level.

Shaft-Sinking by Freezing.

This new system of shaft-sinking in water-bearing soils, differs from all other known methods, in the transformation of this soil from a liquid to a solid state, instead of the usual attempt to drain the shaft by pumping.

The necessity for a pumping plant is avoided, and the danger, as well, from the fluid condition of the surrounding ground. The sinking is carried on as in solid ground, and there is no fear of pressure upon the sides or from the bottom of the shaft, because the soil forms one homogeneous mass, and slips are impossible. M. Poetsch solidifies the fluid soil by congelation, brought about by sinking a system of tubes in which circulates a saline solution of very low temperature. By this simple method he reduces the temperature of the earth to 19 C'ent. (22° Fahr.), and gives it the solidity of sandstone, a conchoidal fracture, and all the properties of stability due to a mineral substance.

Before putting this process into practice (it is patented in Europe and the United States), M. Poetsch made the following experiments: He poured into a box, placed upon the surface of the ground, about five cubic yards of semi-fluid earth; in this box was arranged a system of pipes, connected with an ice machine. Through these pipes a saline freezing solution was circulated, and by meaus of a thermometer the temperature was obtained at varying distances from the pipes. At the end of eight days the entire cube of earth was frozen solid, and when the sides of the box were removed the mass resembled sandstone in its hardness.

This first attempt having demonstrated the possibility of realizing his idea, the inventor decided to test the method upon a grander scale. The Douglass Company, at Aschersleben, graciously put at his disposal the Archibald ligaite mine, near Schneidlingen. The description was translated for *Engineering News*, from *Zeitschrift fur Berg., Hutten, und Salinenwesen in Preussischen Staate*. A shaft, with a retilinear section of 15 44-100x10 3-10 feet, had been sunk through 101½ feet of solid earth, and was only separated from the underlying bed of lignite by a water-bearing stratum 18 feet thick. An attempt had been made to pass this by sheet-piling, but it had been found impossible to sink more than 4½ feet below the line of the water. To furnish an outlet for the incoming water, a drill-hole has been bored, in the center of the well, to the lower galleries already driven in the seam. The effect of this hole was to create a continuous current of water, which made the freezing method much more difficult of execution.

M. Poetsch sunk, to the bottom of the shaft and about 20 in. into the lignite, 23 pipes, each 0,200 m. (7⅞ in.) in diameter; 10 of these pipes were placed against the sides of the shaft. They were fitted to their lower end, and inside with a conical coupling, in which was placed, from bove, a wooden plug shutting the pipes at the bottom. This joint was made perfectly tight by pouring at the bottom of the pipes, successive layers, of 2 in. thickness each, of cement, plaster and moistened clay, the whole covered by a bed of asphalt and an iron washer, properly adjusted. In the interior of these pipes are placed other pipes, 39 millimetres (1.18 in.) in diameter, open at the lower ends and held in place by tubular fittings and stuffing boxes at the upper ends. The inner pipes communicated with a common pipe at the upper ends, and another pipe connected all the outer tubes. The saline solution was driven into the inner pipes, and ascended in the annular space around them, and this in circulating lowered the temperature of the surrounding soil. This system of pipes communicated with a Carre ice-machine, placed upon the surface of the ground above, by means of two pipes, one of which, connecting with the inner tubing, carried off the cold liquid leaving the machine and forced downward by a pump, and the other carried down to the refrigerator the liquid which had passed through the circuit.

The saline solution used had a base of chloride of calcium, of which the freezing point is at 40° below zero, Fahrenheit.

So as to be able to observe the temperature of the earth, 20 pipes are sunk at the bottom of the well and near the sides, at different points, near the freezing-pipes. These pipes 20 feet in length and of small diameter, were closed at the bottom and filled with a solution of chloride of calcium; they were fitted to receive a thermometer. Observations were made daily.

The shaft, by reason of this freezing, was perfectly dry, and the once fluid soil was as hard as sandstone; the sinking was done, consequently, with the pick, point and hammer, without the use of sheet-piling of any description. The shaft was timbered, however, for each meter (3.28 feet) sunk. On September 30, 1883, the coal was reached; this also had frozen to the depth of one *meter* below the pipes, the overlying sand was thoroughly united, by the congelation, to the coal beneath, in such manner that fragments detached by the pick were partly coal and partly frozen sand; separation rarely took place at the plane of contact of the two materials.

When the sinking was completed, horizontal trenches were cut about twenty inches above the coal out into the congealed earth. It was proven by an examination with the thermometer, that the ground was frozen around each pipe in a circle of about five feet in diameter. Other measurements demonstrated the fact that the thickness of the block of ice increased with the depth.

Notwithstanding the unfavorable conditions, the first application of the Poetsch method was perfectly successful, as attested not only by the Director of the Archibald mine, but also by many engineers who visited the works.

In new works undertaken by the inventor, he commences by filling the shaft to the water level with gravel, in case previous sinking has brought the work below that level. The method of putting in place the freezing pipes varies with the location. When the fluid soil has a slight thickness only, and the shaft is already sunk to the water level, the pipes are simply forced into the sand by a sand pump working inside. This was the system actually employed at the Archibald mine and at the Max mine, near Michalkowitz (Upper Silesia).

When the force of the liquid soil is considerable, a boring machine is used, which puts down four pipes at a time, and is worked by the Schonebeck water-jet system. If the fluid soil is not at a great depth below the surface, the pipes are arranged in such a manner that a shaft of the desired dimensions can be sunk inside of them. But when the water stratum is at a great depth, and the sinking of the holes would be too costly, the shaft must first be sunk to water level with a diameter about one *meter* greater than the finished diameter; this larger shaft is timbered, and the freezing pipes sunk inside. If the water-bearing stratum encloses boulders, etc., of considerable dimensions, the holes are either inclined to avoid them, or they are removed altogether, or they are pierced through by special apparatus.

In comparing finally the Poetsch system with previously known methods of passing fluid soils, we are forced to admit that this alone permits an accurate previous estimate of cost and time of sinking. The principal advantages are:

1st. The assurance of a perfectly vertical and rapid sinking of the shaft; as if the work was done in solid ground.

2d. An absolute guarantee of the cost of the plant.

3d. Pumping machinery is not required.

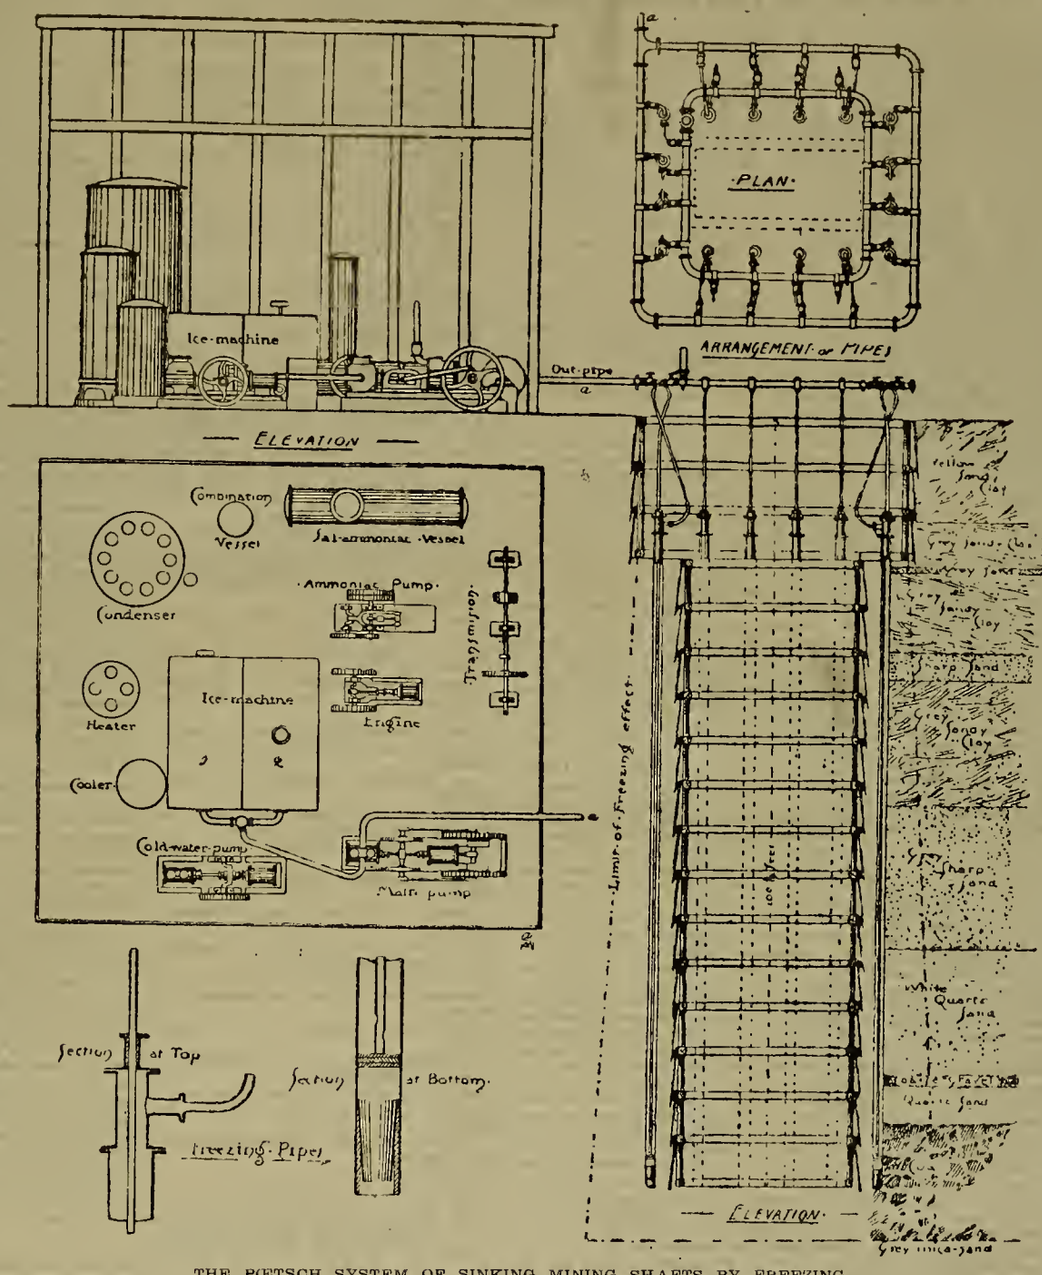
4th. It does away with any difficulty from meeting inclined strata of fluid material, since all the beds passed are converted into a single block of ice.

The engravings show the plant used, and its application at a shaft now being sunk for Dr. Warner Siemens, at the Centrum mine, near Berlin. The drawing from which we copy our illustration comes directly from Mr. Poetsch himself.

The fact that the simplest method of proceeding in any important work is the one last thought of, is strikingly illustrated in the very novel plan suggested and practised by this German engineer.

He has taken advantage of certain solutions whose freezing point is much below that of water, such as a solution of chloride of magnesium which requires a temperature of 40° below zero to convert it into a solid mass. The method of circulating this freezing liquid through the strata to be penetrated, is fully shown in the accompanying cut and the description.

The Poetsch method was first tried at the Archibald colliery, near Schweidlingen, Prussia. The second was at the Centrum mine, illustrated in the engraving. Where about 107 ft. of quick-sand, etc., has to be penetrated. This shaft had baffled engineers for years in their attempts to sink it; but in 33 days Mr. Poetsch had secured a 6 ft. wall of ice around the shaft area, with only 16 freezing tubes, and the shaft is now being excavated and curbed without difficulty. The third piece of work is at present under way at the Nimilia mine, Fensterwalde, where a 9 ft. shaft is being sunk through 120 ft. of quick-sand stratum.



THE POETSCH SYSTEM OF SINKING MINING SHAFTS BY FREEZING.

PLACER gold diggings have been discovered in the bed of the Satsop river, W. T., a few miles from its mouth.

Montana Mining.

An imaginary circle drawn hy a compass of colossal size, with one point resting upon the court house tower and the other describing the line of circumference at a distance of forty miles would include within its limits the richest mining region of the same dimensions in the known world. The Georgetown district, with its great iron mountain from which has been taken the millions of gold produced by the famous Castle mine; the less developed, though doubtles as rich, group of properties, including the Southern Cross, the Pyrenees and Amazon; the Silver Lake district with its great reef of rich silver-bearing ore; the Boulder district, and the metal lined spurs of the Rockies in Jefferson county, the Little Stony, and a thousand other mineral belts, would be within the boundaries of the alladinian circle. The mines of this mineral region are more or less extensively worked, and the section described already supports a large mining population which ie directly tributary to Butte, which furnishes the provisions, supplies, machinery, and, in most cases, the capital for the mining operations of the entire district. The work of hringing these outlying districts into rapid communication with Butte has been commenced hy the completion of the Utah & Northern branch railroad to Anaconda. It may not be long before the rich quartz veins of Silver Lake compel the extension of the Anaconda branch, fifteen miles, to that district and the Custom mills and ore purchasers of Butte may handle the high-grade sulphurets of Silver Reef. Other hranch roads will undoubtedly follow as rapidly as the development of the various districts will warrant, and in the most distant future we may expect to see a system of narrow gauge hranch roads winding their sinuous paths through the mountain gorges and conncting all of the tributary districts with their natural as well as financial and commercial center at Butte.

The True Standard of Value.

In estimating the value of a mining district the error is often committed of measuring the extent and value of mining operations hy the gigantic proportions of the enterprises prosecuted, or hy the amount of dividends paid. The dead and tenantless mill and smelter buildings and silent shaft houses of a hundred deserted mining camps will show the absurdity of making the amount of capital invested a criterion hy which to judge of the merits of any mining property, while a single illustration will exhibit the folly of relying upon the dividends paid as standard of value, viz: The total amount of dividends paid in the United States during the present year to July 1st was only $4,227,400, while the output of Butte mines alone was upwards of $3,000,000 during the same period. The true standard by which to gauge the value af any mining district is its actual

Output in Ore and Bullion,

And gauged hy this standard Butte City now makes a showing which places it in the lead of the great mining camps of the country. The *Miner* recently estimated the shipments of ore and matte from Butte for the current year at 108,000,000 pounds, the estimate being based upon actual shipments over the Utah & Northern railroad during the first half of the year. The statement elicited some criticism from certain journals which seemed averse to giving Butte credit for the gigantic proportions to which her mining operations had attained, but it now seems that the figures given were an under-estimate, and that the matte and ore shipments for the year will approach an aggregate of 150,000,000 pounds. According to the consignment of ore and matte made at the office of the Utah & Northern railroad during the present month up to the 26th inst., the volume of shipments has increased more than fifty per cent over the average monthly shipments of the six preceding months, the total shipments during July to date being 800 car loads, aggregating 16,000,000 pounds. Of these shipments about 12,000,000 pounds were of ore averaging 50 per cent and 4,000,000 pounds was matte.

The bullion shipments of the past week were 61 hars, valued at $94,812.—*Butte Miner.*

History of the Steel Square.

Pliny says that Theodorus, a Greek of Samos, invented the square and level, but the square figures are seen in the represented designs of the Tower of Babel, one of the earliest important known structures. The city of Babylon was a perfect square, and the bricks used in its buildings and walls were square; so probably were those in Babel. Now, to form small squares correctly, and to introduce them in endless combination into buildings, it needed a guiding instrument of some kind. So the square, as a constructive tool, came into use.

Among the ruins of Babylon, Nineveh and Petra, it is said to have been found represented. There are pictures and sculptures from the ruins of Thebes in Egypt, showing the square in the hands of the artisan.

Evidence of its use are also seen in ruins in India, which are thought by some to antedate those found in Egypt. Among the ruins of the Aztecs, or people before them, in Peru and Brazil, it has also been found; and though tools of stone and flint, such as axes, hatchets, hammers, etc., were the first used by primitive man in these ruins that date back beyond history, the square is found, and specimens may be seen in the British Museum.

The square was regarded by the ancients as a symbol of completeness. Simonides speaks of a man square as to his hands, feet, and his mind, etc. Aristotle uses a similar figure.—*California Architect.*

The Little Shops and Their Influence.

A late number of the *Scientific American* says: "It is time that notice should he taken of the work done as well as of the place taken hy our small shops. The 'big concerns' do not monopolize all the skill and mechanical capahility in the country. They may profess to do the best work and produce the hest results, because they are provided with the best tools. But they do not monopolize all the mechanical skill, nor colleot all the best workmen. Many of the best manipulators, and a very large portion of the most exact mechanics, are in the little shops; content, may he, to he the foremen, when in a big shop they would be only first-class workmen. The small shop men are valuable in any shop where mechanics, rather than operatives, are required, hecause they are generally 'men at a pinch,' 'expediency men,' and generally excellent workmen."

The proprietor ot a large manufacturing establishment, building fine tools of particular character, claims that his best men come from small shops where makeshifts and contrivances are the rule. "Such men," he says, "can make the shop hum hy their methods. It is very convenient to have a shop full of adapted tools, hut it is also convenient to have in the shop graduates from 'the little shops' who can contrive as well as tend a machine." There is much to be considered in the above. In looking over the numerous papers devoted to various industrial interests, as we receive them from day to day, we notice that by far the greatest number of contributors and those which are most practical and instructive come from the "little shops" in the small town and villages scattered through the country; and it is not at all surprising that such should be the case when the circumstances connected with it are fully considered.

Mechanics in the city are generally less inclined to be studious than those in the country. There are many more attractions in city life to take up the leisure moments. Workmen in large city shops are generally too much confined to specialties of work, and hence lack the opportunity to acquire that general shop practice and skill which necessarily comes to the workman in small shops. They are not so much given to thinking, contriving and inveuting. They have everything in the way of tools and conveniences readily at hand. The plan of confining a workman to certain narrow limits of practice is no doubt profitahle to the employer, hut it certainly does not tend to improve or enlarge the mechanical skill of the employee. Intelligent and enterprising workmen often rehel at such practice, and push out into the country, where such practice does not prevail. Then they more often hecome their own masters—"set up shop" for themselves; and it is from this class of persons, whether mechanics or manufacturers, that our varione technical journals derive their most valuable "shop notes"—little bits of valuable information, and often more elaborate communications which make up their weekly or monthly aggregate of information, which is eagerly sought for by every person who is desirous and ambitious to excel in his calling.

The present low condition of the industrial arts in China is almost entirely due to the system in universal practice there, of confining workmen to the narrowest possible specialties. There one workman will spend all his days in simply drawing circular lines on cupe and saucers; another will decorate with birds, and generally one variety; another is confined to drawing butterflies only, another dragons, etc. Such practice is also much more general in English shops than in those of our own country.

A man who would excel as a mechanic must master acquirements of a general character. He must not only acquire skill in the use of tools, both small and large and for various purposes, hut he must also attain a thorough knowledge ot the nature of the material upon which he works, and of the varions forms into which that material is wrought. He must also understand the philosophy of the construction and use of tools. Without these acquirements he will remain through all his life simply an imitation of the work of others. A thorough, practical education is the work of a lifetime.

Men are but hoye of a larger growth, and none of us ought ever to imbibe the idea that we are too old to learn. No mechanic ie so perfect but that he can learn something of his neighbor. We may study and practice from day to day, and for years, and still we can never reach the full measure of intellectnal good or of mechanical skill. There is no day in which we may not learn something which will he of advantage to us in the every-day duties of life,

San Francisco Manufactories.

In Assessor Holtz's annual report to the Supervisors he states that the expenses of his office last year amounted to $86,966.29, and appends the following schedule of the principal manufacturing industries of San Francisco:

Agricultural Implements—Men employed, 65; value of manufactures, $250,000.

Artificial Stone—Men, 80; value, $200,000.

Bag Manufactories—Men, women and hoys employed, 340; numher of hags, 9,000,000; value, $2,000,000.

Barrel Manufactories—Employed, 250 men and boys; value, $330,000.

Bedding Manufactories — Employed, 100; value, $350,000.

Boots and Shoes—Employed, 3,000; value, $5,000,000.

Cigar Boxes—Employed, 260; number of boxes made, 4,000,000; value, $400,000: paper boxes, employed, 100; number made, 2,250,000; value, $75,000: wooden boxes, employed, 340; number made, 14,500,000; value, $1,000,000.

Brass Foundries — Employed, 350; value, $535,000.

Breweries—Employed, 450; beer made, barrels, 415,700; value, $2,400,000.

Brooms—Employed, 60; value, $900,000.

Candle—Employed, 70; value, $355,000.

Chemical Works—Employed, 35; value, $350,000.

Cigar Manufactories—Employed, 7,478; cigars made, 102,900,000; cigarettes, 15,000,000; no value given.

Clothing—Employed, 1,900; value, $3,750,000.

Cordage and Rope—Employed, 150; value, $600,000.

Crackers—Employed, 195; value, $1,200,000.

Flour and Feed Mills—Employed, 190; flour made, 360,000 harrels; oatmeal, 2,200 tons; cornmeal and farina, 4,400 tons: barley, 16,000 tons and about 13,000 tons of split peas, cracked wheat, Graham flour, etc.; no value.

Foundries, Boiler and Iron Works — Employed, 2,400; value $6,000,000.

Furs—Employed, 170; value, $500,000.

Furniture—Employed, 1,350; lumber used, 7,000,000 feet; value manufactures, $2,328,000.

Gas Works—Employed, 460; capital stock, $12,000,000.

Glass Works—Employed, 180; value, $175,000.

Hats and Caps — Employed, 80; value, $275,000.

Harness—Employed, 440; value, $1,150,000.

Hose and Belting — Employed, 30; value, $150,000.

Jewelry—Employed, 175; value, $650,000.

Lead Pipe and Shot—Employed, 30; value, $200,000.

Lead Smelting — Employed, 116; value, $400,000.

Linseed Oil — Employed, 60; value of oil, $580,000; value of oil cake, $135,000.

Marble Works — Employed, 180; value, $290,000.

Match Factories — Employed, 120; value, $100,000.

Mirrors — Employed, 9; capital invested, $190,000.

Pickle and Preserved Fruits — Employed, 2,000; value, $1,600,000.

Provision Packing—Employed, 260; value of investment, $165,000; value of products, $2,000,000.

Rolling Mills—Employed, 540; value, $1,868,320.

Salt Works—Employed, 32; tons produced, 30,000; value, $250,000.

Sash, Door, Blind and Finishing Factories—Employed, 1,550; value of manufactures, $5,010,000.

Shipyards—Employed, 200; value of crafts built, $500,000.

Sbirt Manufactories—Employed, 2,550; value, $1,000,000.

Soap—Employed, 130; value, $715,000.

Sugar Refineries—Employed, 360; raw sugar used, 80,000,000 pounds; white sugar made, 50,000,000 pounds; yellow, 28,000,000 pounds; syrup made, 450,000 gallons; value, $8,700,000.

Tanneries — Employed, 335; value, $1,700,000.

Tinware—Employed, 180; value, $525,000.

White Lead—Employed, 75; value, $290,000.

Wooden, Willow Ware and Baskets—Employed, 32; value, $250,000.

Wine and Beer Casks—Employed, 100; value, $200,000.

Wire and Wire Rope—Employed, 50; value, $360,000.

Woolen Mills—Employed, 1,550: value of manufactures, $1,900,000.

NEW MANUFACTURING ENTERPRISES.—In Spite of the dullness of general husiness, says the *American Machinist*, the numher of new manufacturing enterprises projected or under way is by no means small. In the South several large cotton mills are being erected, as well as oil mills, lumber mills, and other manufactories. Western towns are devoting a great deal of attention to new manufacturing enterprises of various kinds, and considerable progress is now being made in that direction. Many towns and cities of importance have hecome quite active in offering inducements to new manufactories to locate witbin their borders. Notwitbstanding periodic seasons of dullness, and the agitation of the tariff question, the future of manufacturing in this country is one of great promise.

Smoke Abatement.

The abatement of the nuisance of smoke in cities, is a subject of late, receiving considerable attention abroad, though in this country no very energetic means have been adopted. In England they have a "National Smoke Abatement Institution." At a recent meeting of the Association some interesting facts were elicited. It was stated that gas engines, which are now used in numerous trades, have in the case of engines up to 20-horse power frequently proved themselves more economical than steam at the relative prices of gas and coal in London, as well as being completely free from smoke. It has been particularly pressed on the notice of the Council that steam-engines erected for the smaller class of workshops, etc., and placed, as they frequently are, at the back of buildings, cause a very great nuisance from smoke; and it is urged that, as gas-engines are more suitable for such trades, the erection of steam-boilers in back premises situated in crowded neighborhoods should be placed under some restriction. The number of gas-engines in London has increased very rapidly within the past three years, and the total number now at work is estimated at upwards of 6,000, and thus a considerable quantity of smoke has been prevented hy their use.

During the past year several new systems of American invention bave been tested, mostly based on Mallet's system, called "controll of combustion." It was shown that, if required, a chimney could he dispensed with, the needful draught being provided by an exhausting fan, without prejudice to the efficiency of the hoiler. Among the boilers tested may he mentioned one with flues curved or quadrantal form. It was found that this form was efficient, and superior for generating steam to the common type of vertical boilers. Another form of boiler, with flat flues and inclined grate, was found efficient as a steam generator, and the form of grate and other arrangements tended to greatly reduced smoke. An interesting series of tests of various mechanical stokers, all of which were in practical operation at one factory, were made, and it was proved that one of these stokers realized an economy of upwards of 12 per cent of fuel over the others, with an entire absence of smoke.

The Council consider the progress made during the past year has been eminently satisfactory and encouraging. They, however, deem it essential that legislation should be advanced *pari passu* with the voluntary efforts which are being put forth. As regards London, they consider it is necessary that the area now covered by the Smoke Abatement Acts should be extended, that all the tradee which do not at present come withiu the operatien of the Acts should be included; and, further, that the smoke of steamers on the river, which is now enormous and practically unchecked, should be brought under control, and the smoke from locomotive engines on the railways throughout the metropolis should also be restrained.

ANOTHER TRIUMPH FOR CALIFORNIA.—Some large stories were told not long ago about the Florida ostrich farm, which it was expected would soon bring feathers within the reach of every hired girl in the country. The feathers, as well as the eggs, however, were counted before they were hatched. The six hirds which were imported at a cost of $10,000, have all died hut one, and there never was an egg laid after they landed. The whole project is a dismal failure; the farm and stock have been disposed of, and the hired girl of the period in that region will sigh for the ostrich plumes in vain. Per contra, the success of this important industry now appears to be assured in California. The attempts made last year to batch the eggs failed, owing to the fact that the hirds were too young to produce fertile eggs, but this year a fine hatch of chickens has been turned out of the incuhator, and the young birds appear healthy and destined to live. One of the hens is hatching a brood after the natural fashion, but inventive genius has so far gotten to the windward of nature, that it is not probahle that setting hens will receive much encouragement. The importance of this industry ie very great, and its successful introduction will go far towards enriching our State and diversifying its industries. Another triumph for California.

THE PAPER MILLS of the world, about 4,000 in number, produce yearly 959,000 tons of paper made from all kinds of substances, including rags, straw and alfalfa. About one-half the quantity is printed upon; and of those 476,000 tons, about 300,000 tons are used by newspapers. The various governments consume in official business about 100,000 tons; schools, 90,000 tons; commerce, 120,000 tons; industry, 90,000 tons; and private correspondence another 90,000 tons. The paper trade employs 192,000 hands, including women and children.

THE Secretary's quarterly report, giving the operations of the Alice company at Butte, for the quarter ending July 1, 1884, shows the total receipts $329,101.70, and after paying dividend number 11, of $50,000 and all expenses, exhibits a balance on hand of $95,338.23 on July 1st.

ENGINEERING NOTES.

Ericsson's Solar Engine.

It is a notable circumstance that so eminently practical an engineer as Capt. Ericsson is recognized to be should never the less be so profound a believer in tho future importance of the solar engines as the motive power for great industries in many portions of the world. With inexhaustible supplies of coal at our command, and with a climate exceedingly variable, the subject possesses for us no practical interest and the same may be said of all the industries of Europe, which are situated principally in the northern portions of that continent; but for those portions of the earth that receive almost perpetual sunshine, the case is different, and Capt. Ericsson has advanced the opinion that the solar engine will be the motive power of the distant future, in which the seats of the industries will be transferred to those regions of the earth which are now at a great disadvantage because of the excessive supplies of solar heat which they receive. However visionary this view of the subject may appear, it is nevertheless highly interesting, and, considering the respectability of its source, worthy of attention.

Capt. Ericsson has constructed an engine which derives its power directly from the heat of the sun. It consists of two parts: the generator and the engine proper. Tho former consisting of a large concave reflector in the form of a cradle or trough, so arranged upon a central pivot that it shall constantly be exposed to the vertical rays of the sun. The solar rays falling upon this reflector, are consecrated upon a horizontal tubular heater placed above it. This water is supported upon side pillars, which are also hollow, and, like the heater contain water. The heater and its supports combined in fact form a steam boiler, since when highly heated by the sun's rays concentrated upon it, the water is converted into steam, by which the engine is operated. The latter may be of any convenient pattern, and does not require special description. The principal dimensions of this apparatus are as follows: Reflector, 11 feet long by 16 feet broad; heater, 6¼ inches in diameter by 11 feet long, exposing 130 × 98 = 1,274 square inches to the action of the reflected solar rays. In the arrangement of the reflector and steam generator, the solar engine of Ericsson differs substantially from that of Mouchot, of which a description has already appeared in our pages.—*Manufacturer and Builder.*

An Immense Canti-Lever Bridge.—One of the gratest pieces of engineering work in course of construction is the canti-lever bridge over the Forth in Scotland. Although from 900 to 1,200 men are employed in the work of preparing the steel, laying foundations for piers, etc., and the capital invested in the plant amounts to a half million of dollars, the contractors will consider themselves fortunate if they can complete the bridge within six years. Immense workshops for preparing the metal work have been erected on the ground, where the workmen also reside, and work is carried on night and day by the aid of electric lights. The cantilevers are so long that instead of attempting to carry them through the workshops where the parts are put together, the work shop itself is moved with all its ponderous machinery. Hydraulic presses are employed to make steel tubes out of plates over twelve feet in length, four feet in width, and an inch and an eighth in thickness. Ten of the plates bent to form and riveted together make up a steel tube twelve feet in diameter. Each canti-lever is to rise to a height of 350 feet above the immense stone piers, and will stretch out arms 650 feet in length, right and left of the center. The complete bridge will tower more than 350 feet above the water level.

Steamship Speed.—The Boston *Globe* is of the opinion that the limit of speed has been reached by ocean steamships, unless some great improvement shall be made in the application or conservation of power. The Oregon, on her recent remarkable trip across the Atlantic, in which she attained a speed of nearly 18 knots an hour, burned 337 tons of coal a day. The Aurania, which made 17 knots, burned 240 tons a day. The *Globe* thinks if it needed nearly 100 tons of coal extra a day to gain a little over one knot an hour, it would be safe to assume that it would have required quite 300 tons additional coal to have gained two extra knots an hour.

Skillful Engineering.—The frame structure of the Schuylkill Valley Railroad Company at Franklin avenue, in Philadelphia, was removed the other day and an iron bridge put in its place. All the work was performed in seventy-five minutes. The iron bridge was built upon a temporary trestling north of the frame structure and as soon as the old bridge was removed the new slid gracefully down greased tracks to the position which it now occupies. This feat in engineering was witnessed by a large gathering of persons. The structure is 80 feet long and weighs about twenty-five tons.

The Largest Engine.—The largest and most powerful engine in the world is that of the new Cunard steamer *Umbria*, which was launched from Cramp's shipyards, Liverpool, June 26th. It is a 12,500 horse-power.

USEFUL INFORMATION.

Dark Leather.

In the discussion of the various processes of leather making, it should be understood that every kind of leather will not take the black or dark color equally well. As far as proven by chemistry and close observation, we find that the materials found in the processes of oak-tanning are such as the dark colors take to kindly, while the elements found in leather tanned with pine or birch bark seem to repel any dark-coloring substances.

If, in attempting to color, the leather is found not to take color well, it should always receive some preparation, which will be found much cheaper in the end, besides the color being much more even and permanent. Some use a solution of the carbonate of soda for this purpose, but we would prefer a solution of caustic or ammonia, as they are much less injurious to the leather. The leather can then be washed off with clean water and the ground color laid on thinly with a brush and rubbed in until it is all taken up.

We find an excellent preparation for this purpose may be obtained by boiling campeachy wood for half an hour or so in half its weight of water, adding a sixth part of fustic to give a more intense black; pouring off the decoction, then boiling the wood in clean water for two hours. If a little potash be added to the second decoction, its extraction will be materially aided. The dye must be poured off clear, if filtered so much the better, and kept in carefully closed vessels. The black color is prepared by pyrolignite of iron, or may be by treating old iron with a decoction of barley, sour beer or sweet tan liquor. This should be left for a few days, the dirt removed from the surface, and the clear liquor drawn off. This black color must not be applied until the ground color is completely absorbed, else the leather will be sooty. After the black dye has been well rubbed in with a brush, it will have a finer appearance if another light coat of campeachy solution is applied, then rinsed with water until it runs off clear.

Spontaneous Combustion.—A curious incident which recently happened in the yard of the Merrimack Manufacturing Company is mentioned by the *Courier* of Lowell, Mass. An old log roller, used in a washing machine in the dye-house, had been condemned because it was worn from age. The iron rod running through the center of the log, by means of which the roller revolved upon its bearings, was surrounded by sulphur to prevent the wood from rotting quickly by the ready contact with water which the iron rod alone would allow, and also to make the parts of the roller hold firmly together. When the roller was condemned it was taken out into the yard and split open to separate the wood from the iron. The parts were not removed, but were left in the sun. Some chips among the refuse were discovered burning about an hour afterward. It created no little surprise at first that wood should take fire by simply being exposed to the sun. An explanation was subsequently arrived at. In splitting the log pieces of sulphur were also broken from the rod. A chemical action, made easy by the long and intimate connection of the sulphur with the iron rod (the latter had rusted considerably) had been partially completed, and needed only the burning rays of the sun to produce perfect combustion. The contact of the sulphur with the oxidizing iron formed sulphide or iron, afterward changing to sulphate, which is very sensitive to igniting agents.

A New Application of Oil for Stilling Rough Water.—The practice of pouring oil on troubled sea water has led a Scotchman to design a shell which can be fired from a mortar, and which on bursting spreads the oil it carries over the sea. The shell is fitted with two fuses, which are set alight by the explosion in the gun, and burn, although the shell is under water. On the bursting of the shell, the oil spreads over the surface, producing smooth water. The device was recently tried with success; the object being to still the sea between two ships in order to let a boat pass from one to the other. The shell fired from the ship carrying it (and every ship might carry a few) burst between the vessel, and calmed the waves with the oil.

Tinning a Soldering Iron.—Put a quarter of a pound of zinc into a bottle containing about half a pint of muriatic acid, let the mixture stand a few hours, and then pour off the liquid portion into another vessel. When about to use the soldering iron scrape the end clean with a file, next heat it not quite to a red heat, then remove the iron from the fire and holding it in the right hand dip the point into the liquid composition and immediately withdrawing it apply the solder by rubbing the solder stick against it, using of course the left hand for the purpose. If the solder has been rubbed on smoothly the iron will then be ready for use.

Oil for Preserving Beer.—A correspondent of the *Scientific American*, writing from Bengal, in India, says: In this country we continually have thunderstorms from March to October. For months together a night never passes without one more or less severe, generally the latter. I always keep beer on draught and find it never goes sour if it is hermetically sealed by having oil poured on the top. This should be poured into the barrel when tapped. On the other hand, without the oil the beer does not keep a week.

Chewing Gum. After kerosene, naptha, benzine, coal tar, and several other things are extracted from crude petroleum, the residue is known as paraffine, a clear white wax without taste or smell. The paraffine is cut up and melted, flavored with vanilla, peppermint, etc., cut into small pieces of various shapes, wrapped in oiled tissue paper, and put on the market as "chewing gum." It is estimated that over 200,000 cakes of chewing gum are sold every week in this country.

Consuming Smoke.—The following simple method for the consumption of smoke is given by a German exchange: Start the fire as usual and let it burn until the coals are in a bright glow; then rake the coals on the right and left, so as to form an empty space along the middle, and put the fresh coals into this space. The smoke which is formed from the fresh coal is consumed by the glowing fires on either side. If the grate is very wide, two such open spaces in the fire are advantageous for the addition of fresh coals.

Gold Coin.—About seven-eights of the gold coinage of the United States is in $20 pieces. This excludes gold coin from use as a currency in ordinary business transactions, and is useful only for export purposes. If Congress would authorize the issue of two, three and five-dollar coins—the gold containing sufficient alloy to make the pieces hard and of good size—they would form a very convenient and useful circulating medium.

The Electric Light Danger.—A few days since a defective connection in the wire of an electric lamp at Joliet, Ill., permitted it to come against the iron front of the building, and the whole iron work of the building became so electrified that whoever touched it received a severe shock. A bit of copper wire stuck in a hole of the iron columns became an electric lamp until the wire melted.

Linseed Oil a Preservative of Scale.—A pint of linseed (not linseed oil) used weekly, in connection with a thorough washing with hose, has been found to be one of the best substances to prevent scale in steam boilers. The linseed softens the scale so much that it comes away like sludge. Ground slippery elm bark also gives good results.

A paper chimney, 50 feet high, has been put up at Breslau. Compressed paper pulp is very hard to burn, and is recommended for fire-proof doors.

GOOD HEALTH.

How Nature Benumbs Pain.

Count Ranzau, the "Streit Hans"—"Rowdy Jack," as his comrades used to call him—once received three dagger stabs before he knew that he was wounded at all. Soldiers, storming a battery have often suddenly broken down from the effects of wounds which they had either not felt, or suspected only on a growing feeling of exhaustion. The Roman gladiators shouted and laughed aloud when their wounds were being dressed. A scalded child sobs and gasps for a therapeutical purpose; instinct teaches it the readiest way to benumb the feeling of pain.

The physiological rationale of all this is that rapid breathing is an anæsthetic. In a paper read before the Philadelphia Medical Society, Dr. W. A. Bonwill ascribes that effect to the influence of the surplus of oxygen which is thus forced upon the lungs just as by the inhalation of nitrous oxyde gas (which is composed of the same elements as common air, but with a larger proportion of oxygen) and mentions a large variety of cases in his own practice where rapid breathing produced all the essential effects of a chemical pain-obtunder, with appreciably diminishing the consciousness of the patient. Persons who object to the use of chloroform (perhaps from and instinctive dread that in their case the ether-slumber might prove a sleep that knows no waking), can benumb their nerves during the progress of a surgical operation by gasping as deeply and as rapidly as possible.

"One of the most marked proofs of its efficacy," says Dr. Bonwill, "was the case of a boy eleven years of age, for whom I had to extract the upper and lower first permanent molars on both sides. He breathed rapidly for nearly a minute, when I removed in about twenty seconds all four of the teeth. He declared there was no pain, and we needed no such assertion, for there was not the slightest indication that he was undergoing a severe operation."—*Popular Science.*

To Remove Foreign Bodies from the Eye. Before resorting to any metallic instrument for this purpose, Dr. C. D. Agnew (*American Practitioner*, May, 1884) would advise you to use an instrument made in the following manner: Take a splinter of soft wood, pine or cedar, and whittle it into the shape of a probe, making it about the length of an ordinary dressing probe. Then take a small, lose flock of cotton, and laying it upon your forefinger, place the pointed end of the stick in the center of it. Then turn the flock of cotton over the end of the stick, winding it round and round, so as to make it adhere firmly. If you will look at the end of such a probe with a two inch lens you will see that it is quite rough, the fibers of cotton making a file-like extremity, in the midst of which are little interstices. As the material is soft, it will do no harm to the cornea when brushed over its surface. When ready to remove the foreign body, have the patient rest his head against your chest, draw the upper lid up with the forefinger of your left hand, and press the lower lid down with the middle finger and then delicately sweep the surface in which the foreign body is embedded, with the end of the cotton probe. When the foreign body is lodged in the center of the cornea, it is most important not to break up the external elastic lamina; for if you do, opacity may follow, and the slightest opacity in the center of the cornea will cause a serious diminution in the sharpness of vision.

The Length of Lines of Type.—A prominent medical man of France has published an article in which he unequivocally condemns the lines of type in books and newspapers, arguing that their present length—being too long—is unfavorable to the eyes and nerves of the readers. He maintains that the eyes cannot, as of right they should, take in all the words of each line in the range of one focus. This doctor insists that the line of type ought not to extend much over two inches, that being the normal range of the eye when it is stationary. In regard to the shape and size of the letters, the same authority declares that the smaller the type the harder the strain on the eyes. An example is given in the miniature edition of Dante, shown in the last French exhibition, which ruined the eye-sight of three printers and two proof-readers. Concerning the shape of letters, the tall, thin Roman letters, technically known in France as poetic type, are the most trying on the eyes. Short heads and tails are to be preferred, because the eyes run more easily over them, and there is less liability of confusing one line with another. Like the German oculists, the French doctor maintains that the shortsightedness so prevalent in Germany is due entirely to the use of Gothic type. The Chinese style of writing and printing, in very narrow columns, would therefore seem to be the true system.

Purity of Sea Air.—It has generally been thought, and direct observation has confirmed the notion, that the air above the sea is singularly free from the low forms of organic life. MM. Moreau and Plantymansion have taken advantage of their leisure during a voyage in the Gironde from Rio de Janeiro to Bordeaux to obtain some data bearing on this question. They have found that over the open sea, at a distance from the vessel, the air contained very little solid matter. The land breezes appear to become rapidly free from the multitude of organisms which they carry with them from populous districts. M. Miquel, of the Montsouris Observatory, regards the fall of germs into the sea as a reassuring fact; breezes blowing from the distant continents, which might otherwise bring epidemics with them, become purified, it is supposed, in crossing the ocean. The gentlemen above named have found that the atmosphere immediately about the vessel practically swarmed with micro organisms; the vessel seemed to be surrounded by an "atmosphere of microbes."

M. Pasteur's Hydrophobia Experiments.—The experiments which M. Pasteur is reported thus far to have made are said to be an unbroken success. Fifty-seven dogs have been the subject of investigation. Of these nineteen were rabid, and by these thirty-eight healthy animals were bitten under uniform conditions. Of the thirty-eight, one-half the number has been previously inoculated or "vaccinated" with attenuated virus; the other half had not. The latter, without a single exception, died with unequivocal signs of rabies, whereas the nineteen others remained as well as ever. They will be watched for a year by veterinary surgeons to see whether the inoculation holds good permanently or only temporarily. If rabies be not spontaneous in its origin, and if the experiments of Pasteur all turn out successful, there seems no reason why canine madness should not be extirpated from our midst.—*Lancet.*

Sickness and Labor.—Sir James Paget estimates that in England the whole population between fifteen and sixty-five years old do in each year 20,000,000 weeks' work less than they might do if it were not for sickness. Typhoid fever has of late destroyed in England and Wales, among persons in the work time of life, nearly four thousand in a year. Here, therefore, from one disease alone, and that preventable, results an annual loss of 230,000 weeks' work, without reckoning what is lost with those who die.

Smoking and Blindness. An English newspaper calls attention to the fact that there are very few smokers among the blind. Soldiers and sailors who are suddenly deprived of their sight sometimes continue to smoke for a while, but it is said that most of them soon give up the habit. They say it gives them no pleasure when they cannot see the smoke, and some even declare that they cannot taste the smoke unless they see it.

MINING SUMMARY.

The following is mostly condensed from journals published in the interior, in proximity to the mines mentioned.

CALIFORNIA.

Amador.

BULLION SHIPMENTS.—Amador *Ledger*, August 16: On Monday of last week the bullion shipment from Amador City amounted to over $47,500. This gold production came from the several mines as near as we can learn as follows: Keystone, $32,000; Bunker Hill, $12,000; South Spring Hill, $3,500.

MISCELLANEOUS.—Work was resumed on the Median mine at Amador City, on Monday morning. Three men were put to work. The Median lies east of the Keystone and South Spring Hill, and bids fair to prove a paying mine. The sulphuret works at Drytown were started up last week with every prospect of a long run. They are now working on sulphurets from Grizzly Flat, El Dorado county. There are five chlorination works in active operation in the county at the present time. The Middle Bar tunnel is now in nearly 1,400 ft. The upper tunnel is almost at a stand-still, only one man being employed there. Work on the tunnel at Hunt's gulch in upraising to make connection with the shaft in Murphy's gulch is progressing satisfactorily. Over 100 ft, or about half the distance, has been accomplished. Some one tore up the pipe that carries water to the Mahoney to run the pumps early this week. Five lengths were taken apart, and pumping operations were brought to a standstill for a few days.

Calaveras.

SOLD.—Calaveras *Chronicle*, Aug. 16: Rumor says that the Hanby mine near Donallon's bridge has been sold for $10,000. The mine is in the ranch of P. Masterson of San Andreas, and in order to get the mine they were obliged to buy the ranch also, for which they paid $2,700. Al. Currier and Joe Reed has gone to work on the Zumwalt gravel claim on the Calaveras. The parties go in as partners with J. H. Zumwalt, the original owner.

BLUE MOUNTAIN.—Cor. San Andreas *Citizen*, Aug. 14: J. Swank, C. L. Butterfield and Byron Swank left Sheep Ranch on Tuesday morning last to commence operation upon their silver lode in the vicinity of Blue mountain. The excitement here relative to this remarkable discovery continues unabated. Sample ore brought down from the lode was tested by Horatio Smith, amalgamator and assayer for the Sheepe Ranch Mining Company, and was found to reach the enormous rich figures of $659.77 per ton silver, with traces of gold—about $4 per ton. Upon inquiry the proprietors of the claim assert that the ore which was assayed was not a specimen but an ordinary sample of the vein rock. Great developments may soon be made upon this remarkable claim and fortunes may be grasped by its respective owners in a very short time. Wealth may spring up in the neighborhood of the majestic old Blue Mountain and a mining boom instituted that will stand unparalled in the history of Calaveras and its gold mines. We hope that it may so prove.

Inyo.

DEFIANCE FURNACE.—Inyo *Independent*, August 16: A run of eight days was completed at the Defiance furnace at the end of last week. The result netted forty tons of bullion, worth $12,000. The mine in connection with the furnace has already produced in bullion $1,150,000. For the first few years the mine did not pay expenses; labor and all kinds of supplies were excessively high, and the process of extracting the metal from the ore was imperfectly understood. Experience remedied the last named difficulty, but still the owners got small profit; getting the bullion to San Francisco alone cost $45 per ton. Since the building of the Carson & Colorado railroad the cost is but $24 per ton. This railroad is of great value to the mining interests of the county. Last winter an immense body of ore was found in the mine. It is rich in silver, but does not contain lead enough to smelt. For some time past work has been pushed to reach another body of ore that is known to contain sixty per cent. of lead; it also contains about sixty ounces of silver per ton. Mixed with the higher grade ore, this will make a good working combination. The main ledge in the mine is sixty feet wide, and has been opened 500 feet on its length, and 300 feet deep. When the ore body, toward which work is now pushed, is reached, the furnace can be kept constantly at work the year round. The cost of reducing the ores is $10 per ton. On the dump at the mine is not less than 30,000 tons of ore, the assay value of which is $8 per ton. The Superintendent of the works—Mr. J. S. Gorman—has gone to San Francisco in search of some method of concentrating this ore by dry process. If such can be found the proprietors of the mine will profit largely, and an immense stimulus will be given to the mining industry of the county, as at many other mines there are large quantities of the same material.

BULLION.—A shipment of bullion was made from Keeler August 8th, that weighed 20,000 pounds. The bullion was for the Selby Smelting Works, Oakland, and was worth $300 per ton.

Mono.

STANDARD CON.—Bodie *Free Press*, August 18: They extracted and shipped to the mill 534 tons of ore and 665 tons of tailings; they received from the ore 710 ounces of crude bullion, and from the tailings 480 ounces, and had have shipped to the company this day $13,648.76, of which $9,010.03 is from 2 week's run on ore, and $4,638.72 from 2 week's run on tailings.

BODIE CON.—At the mill 198 tons of tailings were worked, the average assay value being $8.50 per ton. At the mine the north drift, 200 level, Fortuna vein, is in 47 feet.

BULWER CON.—The south drift from west crosscut No. 2, 500 level, has been advanced during the week 13 feet, and is now in 385 feet.

Nevada.

AN OLD LEDGE, BUT A GOOD ONE.—Nevada *Transcript*, Aug. 16: In early times one of our citizens worked for day's wages on a quartz claim a half a mile from town. Owing to the interest now being taken in quartz hereabout, a few weeks ago he concluded to do a little prospecting in the old mine, it having been abandoned for 25 years. He sunk a shaft on the ground and after having got down a few feet he struck a rather small stringer, took out three tons of rock, and had it crushed. It yielded just $80 per ton. He is now pushing the work ahead and expects to take out 20 tons for the next crushing. The ledge is very small, but almost every piece of rock shows free gold. This is only one of the many ledges in this vicinity which would pay handsomely if the right kind of work was done on them. We reiterate the statement that there is not a better field in the world for quartz prospectors than Nevada City district. There are undoubtedly hundreds of unknown and unclaimed ledges hereabouts that will some day or other prove equal to any now being worked.

WORK AT THE NORTH STAR.—Foothill *Tidings*, August 18: We took a trip on Tuesday to the old Scotia mine, where Mr. May, the contractor, with his corps of assistants are busily engaged in tearing down and removing the building and machinery. Rapid progress is being made in this work, and already considerable of the machinery and most of the heavy timbers of the Scotia have been placed on the grounds at the North Star, and it will be but a very short time before the entire outfit shall have been moved. Down at the North Star ground, work is going rapidly on in the drain tunnel and in the incline. Mr. Stoddart, the superintendent of the mine, informs us that the drain tunnel and the incline shaft are in much better condition than he expected to find them, and that the cost of cleaning out and putting them in order will be less than one-half of the expense that it was estimated at. The work on top at the North Star is going on in fine style, and everything is being made ready for the reception of the Scotia works. Several companies of tributers are at work on a portion of the ground and they have good indications. In a short time business will be very lively around the North Star mine, and in about six weeks there will be about 80 men employed around the premises. The mining outlook for the district south of Grass Valley is indeed flattering.

CANADA HILL DISTRICT.—Nevada *Herald*: The outlook for quartz mining in the above district is very flattering. Marsh & Hothersoll, after doing considerable dead work in their mine, have been rewarded by striking a splendid ledge of rock. The ore looks well, and it is expected will yield handsomely. John Coe, who owns an extension to this ledge, feels so encouraged over the prospects that he has commenced work on his claim. If the strike made holds out, Coe will be very apt to find a good ledge on his ground. The Charonnat mine holds its own, and the mill is running on first-class rock. It continues to be one of the best-paying properties in the county. Ed Moore is working his mine at Canada Hill, and the prospects are improving daily. By miners who have examined it, the location is regarded as a valuable one, but very little systematic work has been done towards opening up the mine.

MARYLAND MINE.—Grass Valley *Union*, August 16: Preparations are nearly perfected for starting up work on the Maryland mine. Connections have been made to run the hoisting and pumping works, the water supply being obtained from the line of the large pipe that supplies the Idaho works. A six-foot Pelton water-wheel is now ready to be put in to drive the machinery, and this wheel will be in place to-morrow. Everything will be in readiness to start up work next week, when the sinking of the main shaft, which is 125 ft in depth, will be resumed, and the work thereafter diligently prosecuted. As is well known, the Maryland is the first extension east on the famous Idaho lode, and as the pay chute is dipping regularly in that direction, it can confidently be counted upon being struck in the Maryland when the proper depth is reached. There is much of promise in the future of the Maryland mine, and it is a location that has been long held in high favor by the mining men of the district.

Plumas.

FOREST KING.—Greenville *Bulletin*, August 13: In company with D. McIntyre, we visited the Forest King mine yesterday. We found everybody busy. The tunnel is now in 225 ft. They have drifted in the vein of pay ore 65 ft. The breast of the vein is now strong. The width of that which pays is about 6 ft, and the rock is now being sent to the mill. It is the intention of the owners to push the drift ahead as fast as possible, and for that purpose they will put on a night shift in addition to the present force. The vein improves as they go ahead. The mill is running nicely and the plates are looking well. It is believed, from the developments that have already been made, that this mine will become one of the most important in this section.

Sierra.

SIERRA BUTTES MINE.—Sierra *Tribune*, Aug. 14: No. 9 tunnel at the Sierra Buttes mine is now in 4,400 ft, with an average of 35 ft being run ahead each week. The pay chute of ore will be encountered in this tunnel about 1,000 ft further ahead. The 40 stamps in the lower mill are running regularly. Work is now progressing on the foundation for another 20 stamps to be placed in operation this fall.

ONE THOUSAND AND ONE GRAVEL MINE.—The above is the most prominent gravel mine in this section. It is located 4½ miles east of town. Eleven men are employed there under the superintendency of Thos. Williams. The character of the gravel is such that all of the gold cannot be saved in the first washing. From the dump the gravel is washed through about 100 ft of flume and then dropped 15 feet on hard bedrock, where it is held by a dam, allowed to slack and then washed a second time. The company propose having a series of these falls and dams and in that way hope to realize all the gold there is in the gravel. As work on the channel progresses the gravel is getting richer and softer. The gold is coarse and heavy. There is a 5 mile ditch connected with the mine which carries an abundant supply of water the greater portion of the year.

KENTUCKY QUARTZ MINE.—Parties are now negotiating for the purchase of the Kentucky quartz claim. A tunnel is being run on the ledge which is already in 200 ft. This tunnel taps the ledge 150 ft below surface. The vein averages about 2½ ft in width and prospects spendidly. The ditch leading from the river to the mine is nearly completed.

THE YOUNG AMERICA.—At the Young America quartz mine a shaft has been sunk 60 ft. The shaft will be put down 75 ft and then a tunnel run to strike about 60 ft still below this. The two will then be connected by raising from the tunnel. The owners propose to develop this mine in as thorough and rapid a manner as possible. At the present workings the vein is 3 ft wide and prospects as rich as ever. Nine men are employed at present.

ACTIVE WORK.—At the Marguerite mine the work of completing the new shaft and prepairingfor the placing of the machinery is going actively ahead. G. Humbert has arrived from below and will superintend the work of placing the new machinery in position. It is expected to have the new plant in running order in 60 days.

CONCLUSION. — The outlook for a prosperous mining era in this section is daily growing brighter. The edges around here are rich and extensive with every possible advantage for operating them on an economical scale. There are many claims owned by parties who do not possess sufficient means to develop them. For that reason many fine opportunities are offered to people who have money to invest in mining properties. [illegible]

RICH GRAVEL.—*Mountain Messenger*, August 16: At the 1,001, claim, last week, $14 was realized from a pan of gravel. The gold is becoming coarser and more plentiful. A small quartz mill is needed to crush the hard cemented gravel, that will probably be put up in time. This is one of the most promising locations in the county.

HOG CANYON.—P. A. Lamping's 12-stamp mill, run by steam power, began Wednesday morning to crush quartz from Maxson's ledge. Supt. Vanslyke is slowly but surely developing one of the most valuable mining properties in Sierra. Supt. J. D. Fagg has six men employed putting in a track from De Long ledge to Lamping's mill, and will soon be rolling out the quartz.

BALD MT. EXTENSION.—The Extension Company expect to raise a chute from the end of the main tunnel, next week. The character of the bedrock indicates gravel above.

Siskiyou.

ORO FINO.—Cor. Yreka *Union*, August 14: I learn from my neighbors who visited Campbell & Co.'s claim, that the owners took out upwards of $50,000. The ground worked this season paid 40 cents to the square foot, or $10.80 to the square yard, or $4438.40 to the square rod. This, with a bank of from 40 to 60 ft, I call first-class diggings. This mine is now considered to be one of the best in this county. Just think of it: the gold dust, after being cleaned and reiorted, weighed upwards of 250 pounds. I have not got the number of days they run, or the cost of the season's work.

HAWKINSVILLE.—Higgins & Spreckles, between here and Yreka, have cleaned up their ground sluice, which gave them a good dividend; in fact, it paid better than they expected. There is at present five companies engaged in ground-sluicing in this vicinity, all of whom are getting good prospects. Two other companies will start up soon. Mr. Bob Lodge, of Yreka, and others have taken up a quartz ledge at the head of Long gulch, about two miles west of here, and have gone to work in earnest taking out quartz, which prospects very well. We may soon see a mill running.

Tuolumne.

THE BONANZA.—Tuolumne *Independent*, August 16: Work on the Bonanza mine will commence soon. We see by the deeds on record that A. B. White and our old friend J. B. Bacon, of San Francisco, have made arrangements for the right of way for a tunnel from Holden's garden into the mine, some 300 ft in depth on the incline. The distance to run to get under the old works will be 390 ft, which includes 60 ft of open cut. They are constructing this tunnel for a certain interest in the mine. The parties have money put up to continue the work of development two or three years, whether they strike it or not. When work was stopped some time ago, very rich rock was in sight. Those who know, say they will have a big thing when the tunnel is completed. Operations are expected to commence next week, under the management of W. R. Ready.

BONANZA MINE.—*Union Democrat*, August 16: Having obtained the right of way through B. A. Smith's lot and privilege from the city to run under the street, J. B. Bacon and A. B. White made a contract Wednesday for the running of a tunnel upwards of 300 feet in length into the Bonanza mine. Upon certain terms and conditions, they will become part owners of the mine with J. G. Divoll, present owner. The contract for running the tunnel was taken by W. R. Ready, and John P. Dart will superintend the work. Driving the tunnel, it is expected, will commence Monday. It is believed that large amounts of gold lie concealed in the mine, and by means of the tunnel it is hoped its treasures will be brought forth.

NEVADA.

Washoe District.

HALE AND NORCROSS.—*Enterprise*, Aug. 16: The west crosscut on the 2800 level was yesterday cut over 50 ft. The face is in solid quartz of excellent appearance, but carrying no metal. The porphyry encountered two or three days ago, which was thought to indicate a near approach to the west well, proved to be merely a small horse. The crosscut will be pushed ahead until it cuts the west clay. This will give the coarse of the ore vein. The ground continues dry. The usual shipment of between 400 and 500 tons of ore will be made this week from the 200 level.

SIERRA NEVADA.—The joint Ophir, Union Con. and Mexican winze, below the 3200 level has been sunk and timbered 8 ft. No permanent change of materal since last report. Repairs are being made to the joint shaft. The broken fly-wheel connecting rod has been repaired, is now in place, and the pumps are running all right. On the 3100 level west crossent No. 3 has passed through the streak of low-grade ore, which is found to be about 10 ft in width, strong and well defined.

OPHIR.—On the 250 level are taking out fillings. On the 500 level the west drift has been extended 55 ft. The joint Sierra Nevada, Mexican and Union Con. winze below the 3200 level has been sunk and timbered 8 ft. No permanent change of material since last report. The fly-wheel connecting rod at the Union shaft has been repaired, is in place, and the pumps are again going all right.

ALTA.—The west drift on the 2150 level is being advance at the rate of over 70 ft a week. It is in material of a very favorable appearance, which carries some low-grade ore. The flow of water from the drill hole in the east drift on the 2150 level is slacking off a good deal. The diamond drill will be put in again to-day and the hole extended.

UNION CON.—On the 3200 level the joint Mexican Ophir and Sierra Nevada winze has been sunk and timbered 8 ft. No permanent change of material since last report.

MEXICAN.—The joint Ophir, Sierra Nevada and Union Con. winze below the 3200 level has been sunk and timbered 8 ft. No permanent change of material since last report.

GOULD AND CURRY.—The joint Best and Belcher west drift on the 2500 level is now being advanced at the rate of about 45 ft per week. The drift is in soft porphyry, with seams of clay and occassional streaks of clay. The north drift from the 825 station of the Bonner shaft is making about 60 ft a week in material of a favorable character.

CHOLLAR.—The main west crosscut on the 2800 level was yesterday out 114 ft. The face was in solid quartz of a good appearance, and carrying a small amount of metal. The ground is perfectly dry.

ALPHA.—The north drift is being advanced in quartz of a promising character, which yields low assays. The east crossent has passed into porphyry. There is hope of finding paying ore to the northward as there is a large amount of quartz in that direction that is of a fine quality and texture.

YELLOW JACKET.—Above the usual quantity and quality of ore is being extracted on the old upper levels, and the mills on the Carson river are kept running to their full capacity. The usual exploring work is successfully continued.

CON. VIRGINIA.—The diamond drill is still being run on the 2900 level. This mine and the California will probably be consolidated. The work in the two mines is so intimatey connected that it cannot very well be segregated.

BENTON.—A branch drift from the main west crosscut on the 2150 level of the Alta is being run into the Benton ground, and is in quartz carrying some low grade ore.

UTAH.—On the 1950 level the south drift is making good progress in a softer and a more favorable material showing streaks of quartz alternating with seams of clay.

CROWN POINT.—A good deal of low-grade ore is still being found on the old upper levels, and the mills on the Carson river are kept running to their full capacity.

ANDES.—About the usual amount of low-grade ore is being extracted, and the prospecting drifts are showing quartz of a promising character.

Central District.

GOOD PROSPECTS DEVELOPED.—*Silver State*, August 13: S. W. Hammand, of Central, is in town, and reports that camp in a flourishing condition. The railroad mine, owned by Clark Brothers and Norman Gilbert, is producing rich ore. One-half the mine—1,500 feet—is owned by Gilbert. This is developed by several inclines and tunnels. The lead is over 30 feet wide, the ore is low grade, but there are immense quantities of it in sight in the mine, besides several hundred tons on the dump. The Clark Brothers' claim that this mine produces ore which works on an average $60 per ton. A lot of several tons of assorted ore recently shipped from the mine to San Francisco netted $260 per ton. The five-stamp mill built on the Humboldt river and run by water power, to work this ore, was started up a few days ago, and it works like a charm. Charley Clark and Ed. Shermer are working on the Mogul mine, and taking out very rich ore. The Mollie, a mine discovered last winter by S. W. Hammand, is proving to be very valuable. It was a blind lead, and was accidentally discovered. The ore assays from $100 to $400 per ton, and there is a streak of it near the surface from five to ten inches thick. M. S. Thompson has resumed operation on the Marietta, which is prospected by an incline to a depth of 325 feet, and it shows ore from top to bottom. The new mill at Mill City has been started up to try the machinery. It works well, and when some slight changes are made in the furnace, it will be run steadily.

Cherry Creek District

TICUP.—Cherry Creek *News*, Aug. 9: A new strike of much promise has been made in the Ticup—right on the surface. The ledge is said to be extensive, and so far as prospected shows well.

Esmeralda District

AURORA'S MINES.—Walker Lake *Bulletin*, Aug. 16: The Humboldt mine is now working 20 men, running drifts and sinking. Ore is being taken out as the development progresses. On the Silver Lining 14 men are at work, running drifts north and south from the shaft. They take out about 10 tons a day. As soon as machinery can be procured stoping will be begun. These mines now, although only in a state of development, supply enough ore to keep the mill running nearly all the time, and there is not a question that when capital can be secured to open them extensively, or when the slow method of development on their own proceeds is completed, they will rank among the richest mines in the State.

Mount Cory District.

THE MOUNT CORY MILL.—Walker Lake *Bulletin*, August 14: The machinery of the Mount Cory mill was stopped Monday, to allow for putting in place two temporary rolls which arrived that afternoon. The new steel tires are on their way from New York, but it was thought better to have temporary tires made in Carson, lest some delay in transportation might necessitate a longer stoppage. The mill will resume this evening. This, the largest mill in the State, furnishes less facts for comment than any other. Its work is the same from day to day, and no accidents mar the regularity of operations. The ore body in the mine is now larger and of better quality than at any other time, and everybody in this section is glad that the enterprising managers are meeting with the success which their liberal preliminary outlay deserves.

Osceola District.

A FAILURE.—Cor. Pioche *Record*, Aug. 12: Some fews weeks ago I wrote you as to the placer mining of Osceola, in this I will treat of the quartz claims at present being worked in this district. The Osceola Company, an eastern incorporation, that some 12 months since bought of George Monroe and others a mine known as the Linton & Monroe claim, the consideration being $60,000, have after a month's trial of said mine, "thrown up the sponge," the speculation being an unprofitable one. Shortly after

purchasing this property the company erected a 20-stamp mill, put hoisting-works on the mine, built roads, boarding and sleeping dwellings for the men, and otherwise expending cash to the amount of $60,000 more, making in all $120,000. In conversation with Supt. J. C. Turner a few days ago, he said that if the ore went $5 per ton he could have made it pay; as it was, it went $3.50, and sooner than run the company any further in debt, he preferred to abandon the enterprise. Mr. Turner further stated that as soon as he had cleaned up, the machinery was to be taken apart and reshipped to the makers in Chicago. The abandonment of this property by the Osceola Company is certain to retard the development of other quartz claims, of which there are quite a number. The next claim of importance is the "Virdi," owned by Capt. Akie. The captain has at present four men employed on the mine and is extracting a very fine character of ore, that is said assay $100 a ton. Some 100 tons of this ore is at present awaiting reduction at the Osceola Company's mill. The next mine of prominence is owned by Boone Tilford. This young man has some 60 tons of high grade ore that is to be worked at the Osceola mill, and if report is true as to late developments in the mine, Mr. Tilford has a bonanza. There are several other promising quartz claims in this section, that are being prospected more or less, and when the large amount of coarse gold that has been taken out of the placer mines is taken into consideration, said amount being only a drop in the bucket to what is still remaining in the deposits, it is safe to infer that some rich and extensive quartz claims will be found at no distant day in this rich but only partially prospected camp.

Patterson District.

RICH ORE.—*Pioche Record*, Aug. 12: We have had grave doubts as to the truthfulness of the reports in regard to the rich ore that has been uncovered in old Patterson district, in the northern part of the county, but such really appears to be the case. The mine owned by Matthewson & Flower is yielding some fabulously rich ore. Nine tons were shipped over to Frisco, Utah, during the week, and there are 10 tons more awaiting shipment. They have a lot of 4 tons, assorted from 18 tons, that they expect will work $1,300 and upwards. The Gray Eagle mine owned by Doc Clay, is reported to contain exceedingly rich ore. If one-half of what we hear in regard to Patterson is correct, there will be a considerable stir and the old abandoned district will be reinhabited.

Spring Valley District

THE EAGLE MINE.—*Silver State*, August 18: H. B. Purdy, a practical mining man of twenty years' experience, has leased the Eagle mine and mill in Spring Valley, and has resumed operations on the property. It will take some weeks to repair the mill and get the mine in good shape for working, after which he will start the mill—a fifteen-stamp one—crushing ore, of which there are large quantities of second-class quality on the dump, and no doubt large bodies of first-class in the mine.

Taylor District.

LEACHING.—White Pine *Reflex*, Aug. 12: A leaching mill is soon to be erected at Hamilton by Messrs. Kendall & Robinson, so we are informed by Mr. Salm who left Taylor a few days ago to assist in its erection. The Argus Mining Co. purchased Henry Hilp's fourth interest in the Neptune mine Wednesday, paying therefore $1,500. Men were put to work on the claim within 12 hours after the purchase. Ten men were put to work on the Neptune, one of the Argus Mining Co.'s claims, Thursday. The surface indications of the Neptune are good. If there is anything in indications this claim will develop into as good a piece of mining property as there is in the camp. It is the intention of the company to push work on the claim from this on.

Tuscarora District.

GRAND PRIZE.—*Times-Review*, Aug. 16: South drift on the 400-ft level has been advanced 22 ft during the week. An upraise has been started to connect with the 300 for ventilation. Progress during the week in the 300 south drift, 21 ft. Stopes producing as usual. Mill is running all right and doing good work.

BELLE ISLE.—Joint Belle Isle and Navajo line upraise 25-ft level, has been carried up a total distance of 55 ft. The vein at this point shows 6 inches of $1,000 ore. The line crosscut 150-ft level, has been extended 50 ft; in this distance the vein has been cut and shows the usual width of high-grade chloride ore. The prospects are very encournging.

INDEPENDENCE. — Total length of west drifts, 400-ft level, 78 ft; progress, 9 ft. The vein shows a fair width and the grade of ore begins to show an improvement. Some very rich ore was taken from the foot-wall the past week. North crosscut, same levels, has been extended 8 ft. Will resume work in No. 2 upraise, 300-ft level, now up 50 ft. Stopes on this level are producing some good ore.

NAVAJO.—Eleven feet have been added to the length of the south drift, 200-ft level. Joint line upraise has been carried up 5 ft and shows a decided improvement. Line crosscut, 150-ft level, has been extended to the east vein, and at this point the vein carries the usual width and grade of ore. North drift from No. 2 crosscut shows an improvement, and has been extended 110 ft. The mine is looking very fair at all points.

White Pine District.

HOPEFUL. — Cor. Eureka *Sentinel*, Aug. 16: Manager E. N. Robinson, accompanied by the Secretary of the Sweetwater Co., Mr. Foster, has arrived, rumor has it, with plenty of coin for mining. The Stafford mine in which the late strike occurred is a good property and has been regarded as such ever since 1869. About that time Hearst, Thornburg and others spent $40,000 on the property. They developed it to the depth of only 80 ft and showed up a considerable body of low-grade ($30) ore, but that sort of stuff could not be made to pay at that time. Since then the Stafford has yielded off and on altogether about $130,000 with comparatively little work done. There is no doubt that the recent find promises well. It occurs in the south end of the mine, shows big, and the ore is rich and runs all the way from $100 to $350 per ton. Mr. Robinson has put eight miner to work to develop it. He has, also, two men working on contract in the Wheeler tunnel. The Jennie A Company, are running a tunnel for its own and the Black Rock prospects, and they are in 700 ft with a promising formation for ore. I am told that as soon as they strike ore in the tunnel, they intend to start up the King furnaces. Several years ago this company bought the Ward Beecher mine and mill and water, also, about 28,000 tons of tailings, with an average assay of from $10 to $12 per ton. It is rumored that Manager Kendall of the Jennie A thinks it likely that his company will start to reduce these tailings. The Continental Co., of San Francisco, are taking out some very fine base ore and will try shipping it to Eureka for reduction, and if the test proves satisfactory they will continue to ship; but extracting, sacking and freighting over 40 miles, on an allowance of 07 per cent, requires mighty big pay ore. The Eberhardt & Aurora Co. are boring away on their tunnel level, which is now about 1,400 ft under Treasure Hill. Everybody hopes they will be successful and come into bonanza yet. But why might it not pay the company to nose around nearer the surface? At a depth exceeding 300 ft they took some $9,000,000. I am not alone in thinking that there is more ore where that came from. This company has run through 10,000 ft of ground—1,700 ft of incline, 6,400 ft of tunnel and some 1,000 ft of drifts. The Eberhardt truly deserves praise, for they have done more than all other companies combined in this county. Started in 1871, they built a 60-stamp mill at a cost of $300,000, which was destroyed by fire. They next built a tramway at about the same expense. They may congratulate themselves on this, at least, that they have more work to show for less money than any company in Nevada. They have always paid their miners $4 a day, and I am sure they are worth their hire—good, practical miners that work under ground more than a mile and a half deep in bad air and liable to accident at any time.

ARIZONA.

BLACK CANYON.—Prescott *Courier*, Aug. 11: W. C. Dawes is in receipt of a letter from Messrs. McPhee and Rice, who are prospecting the American Tramp mine, in Black Canyon district. The mine is opened by shaft, 120 ft, ledge 7 ft thick, with 4 ft of ore. They are now drifting, are moderate in their ideas, but believe they have something for a rainy day. Messrs. Bond & Hayden have leased the Bradshaw Basin mill and roaster and will now work 300 or 400 tons of their best ore. They may also do custom work. They have a fine mine. B. T. Riggs and John Curtin have leased the discovery location on the Tiger lode and will soon start work on the same. Mr. Riggs knows the Tiger "like a book" and will surely take out some rich silver ore. John Holmes, whom we may call the Tyler of Turkey Creek district, was in Prescott yesterday, arranging for shipping some of his ore. The Dosoris company will very soon divide about $75,000 between its owners. Messrs. Cox and Craigue have gone east. One of our mercantile firms, take in about $1,000 a month in placer gold.

LESSEES. — Prescott *Courier*, Aug. 16: B. T. Riggs, who recently visited the Del Pasco, tells us that the lessees of the mill do their own work and are making money. They are mining in the Pine Tree lode. This is "clean-up" day at the Kimball mill. Messrs. Bagley and Marlow are developing a promising mica mine 2½ miles from Williamson valley. The vein is large and so are the leaves of mica. Messrs. Burton and Murphy have leased one of Major Dake's Walker District mines. They expect to take out silver worth $300 per ton. Some 20 miners are at work in the Lane mine, the ore of which is being worked at the Tuscumbia mill. The St. Louis Yavapai Co., of Humbug district, think their mill will be running in about 30 days.

A GOOD WORD FOR DOS CABEZAS.—*Epitaph*, August 16: Mr. C. E. Dailey, who has just returned from Willcox, gives a very flattering report to the *Citizen* of the mines at Dos Cabezas. The ledges are strong and wide, and cut through the mountain ranges. In one shaft the ore has averaged over $100 per ton in gold, and a few days ago a body of ore was encountered, which gives assays of $30,000 to $40,000 per ton. The gold is in white quartz, and there is but little of it of low grade. Some miners owning a claim there are erecting a five-stamp mill, which will be running in a few weeks. From the grade of ore they have on the dump, it is thought, they will easily take out over $1,500 per day. Mr. Daily is satisfied that these mines will prove more valuable than all the Quijotoas. The gentleman has the repution of being very conservative in his statements, but his praise of these mines is unreserved. All efforts at a boom have been discouraged, and the mines are being quietly and slowly developed, and show their merits to every judge of mineral rock.

DAKOTA.

CALEDONIA CAVE.—Black Hills *Pioneer*, August 16: Another cave has taken place in the Caledonia mine that effectually places that property back to condition that is no better than when it had nothing but a prospect hole. The cave of the old shaft some months ago occasioned the sinking of another. The new one was put down at a point only a few feet distant from the old. It was just completed, having reached the 300-foot level, Saturday evening last the miners discovered that the walls were giving way, and that a cave was beyond doubt. The foreman ordered all men up to await results. Yesterday morning it was growing worse, and continued to do so until the cave took place. The new shaft that, after two months' labor in sinking, is filled. The machinery used for hoisting went down, besides everything that was kept in the chamber. The ground fell from the surface, thus completely demolishing every vestige of shaft or hoisting machinery. It is stated that the Caledonia is now provided with no way for even a man to reach its ore body, much less produce rock for milling purposes. An entirely new shaft will have to be sunk. A miner acquainted with the Caledonia states that in one or two places a shaft can be lowered through good, solid ground, and that when the level is reached a drift of some 400 feet will reach the mine. At best, the mill is shut down for a period that will consume some three months. This fate to the rich Caledonia we deplore very much, as it was just beginning to make great promise. Since the clean-up of the Blacktail hydraulic company's flume, the ground washed out has been measured, and the yield was found to be nearly $2 per cubic yard. This we call pretty good placer mines.

IDAHO.

CŒUR D'ALENE.—Butte *Miner*, August 16: Mr. W. Y. Pemberton returned yesterday from Eagle City. Mr. Pemberton declares in the most emphatic terms that the Cœur d'Alene country is the richest in gold deposits of any now known upon the Pacific slope. Recent decisions by the Judge of the District Court, the first term of which has just closed there, have removed a cloud which has long hung over the place. Heretofore owners of many of the principal mines there have been silent concerning the output of their claims, and have done but little work, from the fact that their ground was in litigation, and they didn't care about developing it, not knowing but it might pass into other hands through a decision of the court. And then again, as the title of their claims was in dispute, business men were not inclined to extend credit to the claimants, and hence doubt and uncertainty were felt upon every hand. This is now all removed. Claimants feel secure in the title to their ground, and the work of development and extracting the precious metal has commenced with renewed vigor and attended by the most encouraging results. The output of gold has largely increased, credit is extended to claim owners who desire it, more men are being employed in the mines, and a successful mining season is assured. Mr. Pemberton says that wherever bedrock has been struck, gold in paying quantities is found, without exception. A very important factor in the prosperity of the country is the "old channel diggings," discovered upon the mountain side above the creek. These diggings have been traced for a distance of 25 miles, and the ground located. Men pack the dirt in sacks down to the creek, and make good wages every day in their clean-ups. A ditch is being built which will cover all these old channel diggings. When it is completed and the hydraulics get to work, the output of gold, Mr. Pemberton thinks, will be enormous. Bedrock has been reached upon but one claim in Eagle creek—the Maggie. It is 32 feet to the bedrock, and 3 feet of gravel, yielding $7 to the pan, was found upon it. The side gulches are all paying well where water can be obtained. But little is being done in developing quartz lodes. The "Mother lode" has been stripped for a distance of about 60 feet, and shows free gold in profusion. Keeler & Co., the owners of the famous "Widow's claim," will increase their working force to 75 men. Other companies will also employ a larger number of men. Town property is not much in demand. Timber is plenty, water abundant, and all the facilities for mining at hand. Mr. Pemberton thinks the country will not be worked out during the next 25 years.

NEW MEXICO

ORGAN TONES.—Cor. Rio Grande *Republican*, August 6: Kline & Co. are down on the Gray Eagle about 120 ft. The Memphis has shut down, but strong hopes are entertained that it is only temporary. The Smelter is running and turning out some fine bullion. They have over 20 men on the pay roll. Messrs. Newland, Throyer and Edwards are still at work on the Montrose, with a fair outlook for plenty of mineral. Dr. Burt is taking out some very nice ore from the Toughnut, and Duncan McCowen has three or four men on the Little Buck. Mayberry, McLaughlin and Rennard are down from San Andres. They report a better outlook than ever, and are sanguine over their prospects.

MONTANA.

MINES ABOUT MARYSVILLE.—Cor. Helena *Independent*, August 16: The contractor on the 30-stamp addition to the new Montana Company mill is now adding the finishing touches and soon 60 stamps will be dropping on the Drum Lummon ore with strong probabilities that many more will be erected in the future. Wallace Birkhead and B. De Camp have struck some very rich free gold rock in the Robert Emmet lode on Cruse Hill, west of the Drum Lummon. The find is not sufficiently developed to determine the extent, but is promising. Cotter and Hickey will soon have pans placed in the Whippoorwill mill to save the silver product of their Empire mine. In fact the success of the pan process at Gloster has demonstrated that to save a high per cent of the noble metals in this district iron pans are a necessity. It is undoubtedly a wiser course in Messrs. Vestel, Muth, Travor, and Rumping, organizing a company to develop and work the Empire, on Cruse Hill. This property is sufficiently developed to prove that it is a mine of value, and in time will return each owner a fortune. Marysville must be an overestimated place on the outside, judging by the number of persons coming into camp to find employment, and to go into business. The town is overdone in every branch, and still they come. Marysville—with the Drum Lummon, pure air, mountain scenery, and cord wood—has only one want, and that is capital to buy and develop some of the immense veins of mineral in the surrounding hills—veins that show as well and are as valuable as the Drum Lummon or Gloster were a few short years ago, and which to-day could be bought for a small figure, but in a few years will command a king's ransom. It is all folly to think that the Drum Lummon is the only mine in this section, any more than the Alice is the only one at Butte, the Little Pittsburg at Lendville, or the Horn Silver in Utah. There are any number of them here, and some enterprising capitalist will yet establish the fact. The great difficulty is that these claims are owned by men who are unable to develop and bring their value to light.

THE ANACONDA MINE. Butte *Miner*, August 16: The work on the Anaconda mine is going on as vigorously as usual, but the amount of ore taken out has not been so much as usual for the last week. This is due to the fact that as many hands as can be profitably used have been set to work both in the Anaconda and St. Lawrence mines to unite the two with a tunnel. The shipments of ore from the Anaconda for the past few days have averaged only about 80 tons a day. The shipments for the past month have been nearly 4,050 tons.

THE PARROTT SMELTER.—The Parrott concentrator (old works) after stopping for a few days for a general repairing, started again last week. The new works are rapidly progressing. Two of the new roasting furnaces have been fired up and are doing satisfactory work. The blast furnace is up and nearly ready for use. On Tuesday the converters came and yesterday were being set up and put in position.

JEFFERSON COUNTY MINES.—Cor. Butte *Miner*, August 16: Among the most valuable mines at Cataract may be mentioned the Boulder Chief and Butterfly lodes, owned by Wm. Morrow. The former is worked by a tunnel, which strikes a 4-foot vein of fine looking 40-ounce ore, at a distance of 111 feet from the mouth, and at a depth of 85 feet from the surface. The Boulder Chief is a well defined lead, which can be readily traced for over 1,000 feet, and upon which several prospect holes, varying from 10 to 25 feet, have been sunk. The vein is 27 feet in width, and the very smallest average assay from all the openings shows 40 ounces of silver. The ore is easily worked, and often pockets are found containing ore which will assay one-half silver. Mr. Morrow holds the property, in its undeveloped state, at $35,000. Mr. Charles Smith has commenced work on the Custer mine, owned by himself, George Fitschen, Peter Pfieffer and Henry Welder. The ore taken from the mine at a depth of 95 feet is much of it free milling, and shows assays from 20 ounces (the least) to 250 ounces. Five tons have just been sent to Boulder. The vein is 8 feet in width, so far as known, but as yet no hanging wall has been found. An occasional very rich find in all the mines of this district proves such an incentive that every owner of properties with even fair prospects is stimulated to push work forward to the full extent of his financial ability. The White Pine lode, owned by Pat. Early, Ebner Gile and John Olsen, has a shaft 50 feet deep, and shows a 7-foot vein of good ore, going nearly 50 ounces. It has been closed down for some time, on account of shortage in capital, but work is again resumed and will be continued right along. The Kit Carson is owned by Sam Hauser, A. M. Holter and Bob Gibbons. The mine is situated in the Low Lands, at the northeast corner of Elk Park, and is considered a most valuable property.

OREGON.

GOOD WAGES.—Jacksonville *Times*, August 16: Sargent & Sons, of Steamboat, are still engaged in mining, and are making good wages. Superintendent Ennis, of the Sterling mine, informs us that they have finished cleaning up for this year, and will soon commence fitting up for next season. Messrs. Prickett, Finney & Shearer, of Steamboat, have bought Beckner & Co.'s ditch, and are engaged in cleaning it out. They propose running on an extensive scale next season. T. L. Knox & Co., of Applegate, have bonded one of their quartz ledges to Portland parties for $2,000, who propose to put up a mill at once, and test the ore of this, as well as other ledges in that vicinity.

UTAH

REVIEW.—Salt Lake *Tribune*, August 18: The week has been rather quiet in mining circles, but the movement of the metals has been fair. The receipts of bullion and ore in this city for the week ending August 13th, inclusive, were $125,065.42, of which $113,705.42 was bullion and $11,900 was ore. The receipts of the week previous were $157,109.70, of which $141,999.55 was bullion. The shipments for the week ending August 9th were forty-two cars of bullion and forty cars of ore, shipped East. The shipments of Horn Silver bullion for the week ending August 13th, inclusive, amounted to eighteen cars of bullion of the value of $54,000, making the shipment to date, for the present year, $1,498,000, from which three quarterly dividends of $300,000 each, aggregating $900,000, have been declared and paid. The Ontario shipped during the week fifty-two bars of bullion, assaying $37,710.42, being a total product for the year of $1,023,497.79. The regular monthly dividends are paid promptly, and for the seven months declared, have amounted to $525,000, or $3.50 per share. The Crescent shipped one lot of ore, $1,850, and the Park City smelter sent in one car of bullion, $1,550. The product of the Hanauer smelter for the week was ten cars of bullion, $15,145. A correspondent writes as follows: "The Lead mine, Bingham, has been making regular shipments of ore, after the trouble they have had to contend with by the surface water getting into the mine through the old workings in the spring of this year, namely, by the old cave that occurred some eighteen months since. The mine has never looked better since it has been opened than at present, which demonstrates that, by judicious management and men who are miners in charge of the property, there are still mines in Bingham to be made to pay.

WASHINGTON TERRITORY.

THE CLE-EL-UM MINES. — Kittitas *Localizer*, August 14: The Polepick company is sinking a shaft on the Polepick mine, and have two arastras running on their own ore. The blacksmiths are laying in their supplies of coal from the Cle-el-um mines. One team went up Saturday and one Monday. Having four horses each they will bring one and a half tons to the load. The distance is from 30 to 35 miles to Ellensburgh. J. W. Stone is building a tramway below his coal mine, to be utilized for transporting the coal from the mine to the dump, where it can be loaded from the car into the wagon. The tramway will be a great convenience in the handling of the coal. Henry Livingston has been prospecting in the Swauk, Peshastin and Cle-el-um districts for the last three or four years, and has sunk a good many holes and run in on many ledges with no great encouragement. But we are pleased to state that he has discovered something lately that will do to tie to, and that will make him his fortune. Walter Elliott came down last week from the Swauk; he showed us several ounces of gold taken from the claim of Elliott, McClure & Slingsby. The gold is of a beautiful light color. The company has done quite an amount of work, stripping, etc., and are now washing up and reaping a reward for their labor. Henry Livingston and F. D. Schnebly have been prospecting in the Cle-el-um mining district a good portion of the summer. A few days ago they discovered a geniune lead of galena that carries considerable silver. No assay has been made of it, but they have a small bar made from it, weighing an ounce or more, that speaks for itself. It is clear galena, and where it came from there is plenty more like it. It is the richest of its kind yet discovered, and a sample of it can be seen in our office. Elmer Lockwood, of Peshastin, came down from that camp last week. He informed us that a new discovery on the Bodtail, one of the leads belonging to the Schaffer Co., has been made, of free milling ore, worth $10 to $60 per ton. Culver took some ore from the same a few years ago that went 25 cents to the pound. Two other discoveries have been made on the Schaffer company's ground. It is not known, however, how rich or extensive they are.

Metallurgy and Ores.

Nevada Metallurgical Works.

NO. 23 STEVENSON STREET,
Near First and Market Streets, S. F.

C. A. LUCKHARDT, Manager. ESTABLISHED 1869.

Ores worked by any Process.
Ores Sampled.
Assaying in all its Branches.
Analyses of Ores, Minerals, Waters, etc.
Working Tests (practical) Made.
Plans and Specifications furnished for the most suitable Process for Working Ores.
Special attention paid to Examinations of Mines; Plans and Reports furnished.

C. A. LUCKHARDT & CO.,
(Formerly Huhn & Luckhardt),
Mining Engineers and Metallurgists.

JOHN TAYLOR & CO.,

IMPORTERS AND DEALERS IN

Assayers' Materials,

MINE AND MILL SUPPLIES,

CHEMICAL APPARATUS AND CHEMICALS, DRUGGISTS' GLASSWARE AND SUNDRIES, ETC.

118 and 120 Market Street and 15 and 17 California St., San Francieco.

We would call the attention of Assayers, Chemists, Mining Companies, Milling Companies, Prospectors, etc., to our full stock of Balances, Furnaces, Muffles, Crucibles, Scorifiers, etc., including, also, a full stock of Chemicals.
Having been engaged in furnishing these supplies since the first discovery of mines on the Pacific Coast, we feel confident from our experience we can well suit the demand for these goods, both as to quality and price. Our New Illustrated Catalogue, with prices, will be sent on application.
☞ Our Gold and Silver Tables, showing the value per ounce Troy at different degrees of fineness, and valuable tables for computation of assays in grains and grammes, will be sent free upon application. Agents for the Patent Plumbago Crucible Co., London, England.

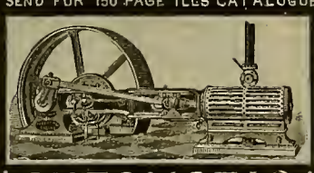
SEND FOR 150 PAGE ILLS CAT ALOGUE.



AUTOMATIC

Awarded highest premiums at Cincinnati and Louisville Expositions of 1883, for "Best Automatic Engine." We will furnish anyone copies of the ORIGINAL ENTRIES of several engine builders who claim they were not competing with us. They all entered in the same class with us, and now by deceptive Circulars (one headed "Fact versus Falsehood,") attempt to mislead.

☞ *No premiums were offered for Condensing Engines.*

JOSHUA HENDY MACHINE WORKS, Agents for the Pacific States, 49 & 51 Fremont St., San Francisco.

JENKINS PATENT VALVES.
Gate, Globe, Angle, Check and Safety.

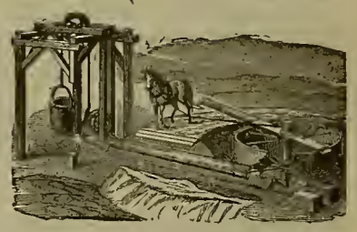
Manufactured of BEST STEAM METAL. We claim the following advantages over all other Valves and Gauge Cocks now in use:

1. A perfectly tight Valve under any and all pressures of steam, oils or gases.
2. Sand or grit of any kind will not injure the seat.
3. You do not have to take them off to repair them.
4. They can be repaired by any mechanic in a few minutes.
5. The elasticity of the Disc allows it to adapt itself to an imperfect surface.

In Valves having ground or metal seats, should sand or grit get upon the seat it is impossible to make them tight except by regrinding, which is expensive if done by hand, and if done by machine soon wears out the valve, and in most cases they have to be dis connected from the pipes, often costing more than a new valve. The JENKINS Disc used in these Valves is manufactured under our 1880 Patent, and will stand 200 lbs. steam. Sample orders solicited. To avoid imposition, see that Valves are stamped "Jenkins Bros." For sale by

DUNHAM, CARRIGAN & CO., San Francisco, Cal.

MINERS' HORSE WHIM.



ONE HORSE CAN EASILY HOIST OVER 1,000 LBS. at a depth of 500 feet. The Whim is mainly built of wrought iron. The hoisting-drum is thrown out of gear by the lever, while the load is held in place with a brake by the man tending the bucket. The standard of the whim is bolted to bed-timbers, thus avoiding all framework. When required, these whims are made in sections to pack on mules.

120 in Actual Use.

Montana Industrial Resources.

Advancement of the Great Northwest.

Within the past few years no other region of the United States has made such rapid strides in industrial advancement as Montana. One of her mining camps alone—Butte—is attracting the attention of the world by its immense and steady output of bullion. This output is gradually increasing, moreover, as the mines are more fully developed. The reduction works of the camp are made on the most approved modern plans, and are economically and scientifically conducted. Butte's copper product alone, aside from the precious metals, exceeds all localities in the United States except the old mines of Lake Superior. But the gold mines of Montana are by no means confined to one camp. There are many localities where bullion is being produced in quantities, and this year the Territory will take very high rank in the list of bullion-producing States and Territories.

The completion of the Northern Pacific Railroad, passing, as it does, through the Territory, has had the effect of greatly developing its resources. Agriculture, stock raising and manufactures have received an impetus, and the population has largely increased over the whole region. New towns are being built, and old ones enlarged, the whole Territory being exceedingly prosperous.

We have, during the past year, devoted considerable space in describing the resources of Montana, but such is the interest in the region that we intend making special efforts to set before our readers fuller information about the Territory. We are about to send an agent to visit Montana, and will shortly issue a sheet giving general and detailed information concerning the mines, farms, natural and industrial resources, climate, soils, settlements, mills, business interests, etc.

Mr. H. G. Parsons, an experienced and favorably known news publisher of San Francisco, will, during business vacation, represent the interest of this paper in Montana, collecting mining, agriculture and industrial information for our readers, and cuitivating on the part of the PRESS even closer and more useful relations, we trust, with our Territorial neighbors, for the future. We ask all friends of progressive industry there to help him in securing information for our columns and names for our subscription lists.

Mining Share Market.

Mining stocks continue quite dull. There have been no ore developments for a long time in the leading mines, and what few little spurts have occurred, have been brought about by the manipulators, independent of any special merit in the mines. As to the slim yield now resulting at even the big mines in the Comstock the following statement for the quarter, ending June 30, 1884, is to the point: Gross value, $670,657; total cost, $684,528.90. It cost $248,290.27 to produce $208,321.16 in bullion from the Yellow Jacket mine. Hale & Norcross yielded $15,205.61, at a cost of $11,928.73. Potosi yielded $58,233.03, at a cost of $56,903.03. Ophir yielded $22,030.39, at a cost of $22,041.76. Crown Point yielded $144,466.11, at a cost of $137,840.55, and Belcher $104,819.37, at a cost of $100,756.07. The tax on the net proceeds amounted to $4,040.87. Following were the values per ton of the ore: Belcher, $13.47; Crown Point, $12.67; Kentuck, $19; Yellow Jacket, $13.98; Potosi, $13.50; Hale & Norcross, $15.30, and Ophir, $11.60.

Bullion Shipments.

Horn Silver, August 13, $12,000; Ontario, August 13, $4,488; Park City, 12, $1.550; Wood River, 12, $5,200; Horn Silver, 12, $24,000; Ontario, 12, $11,733; Hanauer, 14, $6,805; Nevada, 14, $5,300; Ontario, 14, $4,597; Horn Silver, 14, $12,000; Hanauer, 15, $2,820; Crescent, 15, $3,000; Horn Silver, 15, $6,000; Ontario, 15, $4,521; Horn Silver, 17, $6,000; Tintic, 17, $5,000; Contention, 9, $9,712; Navajo, 18, $10,500; Syndicate, 16, $6,335; Horn Silver, 16, $12,000; Ontario, 16, $16,444; Hanauer, 16, $1,360. During the week ending August 16th, there were shipped from Salt Lake 13 cars of bullion, 38 cars of lead ore, 1 car of copper ore, and 1 car of copper bullion, making a total of 83 cars, aggregating 2,215,014 pounds.

Our Agents.

OUR FRIENDS can do much in aid of our paper and the cause of practical knowledge and science, by assisting Agents in their labors of canvassing, by lending their influence and encouraging favors. We intend to send none but worthy men.

JARED C. HOAG—California.
J. J. BARTELL—California.
A. S. DENNIS—San Mateo county.
A. C. KNOX—Nevada (State.)
B. W. CROWELL—Fresno and Tulare counties.
JOHN H. STURCKE—Santa Clara and San Benito counties.
GEO. MCDOWELL—Plumas and Sierra counties.
WM. PASCOE—San Francisco.
WM. H. COOK—Alameda county.
H. O. PARSONS—Idaho and Montana.

COMPLIMENTARY SAMPLES OF THIS PAPER are occasionally sent to parties connected with the interests specially represented in its columns. Persons so receiving copies are requested to examine its contents, terms of subscription, and give it their own patronage, and, as far as practicable, aid in circulating the journal, and making its value more widely known to others, and extending its influence in the cause it faithfully serves. Subscription rate, $3 a year. Extra copies mailed for 10 cents, if ordered soon enough. Personal attention will be called to this (as well as other notices, at times), by turning a leaf.

MINING SHAREHOLDERS' DIRECTORY.

COMPILED EVERY THURSDAY FROM ADVERTISEMENTS IN MINING AND SCIENTIFIC PRESS AND OTHER S. F. JOURNALS.

Don't Fail to Write.

Should this paper be received by any subscriber who does not want it, *or beyond the time he intends to pay for it*, let him not fail to write us *direct* to stop it. A postal card (costing one cent only) will suffice. We will not knowingly send the paper to anyone who does not wish it, but if it is continued, through the failure of the subscriber to notify us to discontinue it, or some irresponsible party requested to stop it, we shall positively demand payment for the time it is sent.

REMITTANCES to this office should be made by postal order or registered letter, when practicable. Cost of postal order, for $15 or less, 10 cts.; for registered letter, in addition to regular postage (at 3 cts per half ounce), 10 cts

Cheap Ore Pulverizer.

There is for sale in this city, by I. A. Heald, American Machine and Model Works, 111 and 113 First street, a Rutherford Pulverizer, an improved revolving barrel crusher, which was only used a few times and is as good as new. It will be sold very much below costs, and miners who are in need of such an appliance for a small mine will do well to make inquiries concerning it. It is suitable for a pulverizing mill for powder or other substances. References as to above can be had upon applying to this office.

IMPORTANT additions are being continually made in Woodward's Gardens. The grotto walled with aquaria is constantly receiving accessions of new fish and other marine life. The number of sea lions is increased, and there is a better chance to study their actions. The pavilion has new varieties of performances. The floral department is replete, and the wild animals in good vigor. A day at Woodward's Gardens is a day well spent.

Lost Papers.

If any subscriber fails to receive this paper promptly, after making due inquiries at the Postoffice, he is urgently requested to notify this office by *letter*, that we may send the missing papers, and, if possible, guard against further irregularities

PATENTS AND INVENTIONS.

List of U. S. Patents for Pacific Coast Inventors.

From the official list of U. S. Patents in DEWEY & CO.'s SCIENTIFIC PRESS PATENT AGENCY, 252 Market St., S. F.

FOR WEEK ENDING AUGUST 12, 1884.

303,384.—ELEVATING APPARATUS—Ira Bishop, S. F.

303,493.—TREATING CIGARS—Jas. D. Culp, San Felipe, Cal.

303,504.—LIFTING JACK—L. P. Garcin, S. F.

303,511.—TUCKER FOR SEWING MACHINE—A. J. Hart, S. F.

303,575.—BOILER FEEDER REGULATOR—M. Jorgensen, Sonoma, Cal.

303,523.—FEED WATER HEATER—Daniel Lee, S. F.

303,440.—INDEX—Max Levy, S. F.

303,578.—OVERALLS—David Lubin, S. F.

303,535.—TRACTION CABLE GRIP—Wm. Martin, S. F.

303,394.—CAR COUPLING—T. H. N. McNamee, Lemoore, Cal.

303,447.—MACHINE FOR PULLING COTTON STALKS—C. E. Moser, Healdsburg, Cal.

303,405.—BEAM WHEEL—J. W. Stafford, Acampo, Cal.

303,469.—PAPER FILE—R. P. Traxler, S. F.

303,410.—REAMER—J. C. W. Wilson, East Portland, Or.

NOTE.—Copies of U. S. and Foreign Patents furnished by DEWEY & CO., in the shortest time possible (by telegraph or otherwise), at the lowest rates. All patent business for Pacific coast inventors transacted with perfect security and in the shortest possible time.

Notices of Recent Patents.

Among the patents recently obtained through Dewey & Co.'s SCIENTIFIC PRESS U. S. and Foreign Patent Agency, the following are worthy of special mention:

STEP AND EXTENSION LADDERS.—Robert Walker, Oakland. No. 302,066. Dated July 15, 1884. This ladder is one that may be used as an extension or step ladder at will. It consists of two ladder sections united by a rod and slotted connections, so that the two parts being united at one end may be separated at the other in a manner of an ordinary step ladder; or by extending the two in line they may be locked together, so as to form a rigid continuous ladder of nearly double the length of either section.

SAFETY GUARDS FOR CARS.—Lewis Peterson, S. F., No. 302,024. Dated July 15, 1884. This safety guard for cars and other heavy moving objects, consists of a combination of devices. The principal object is to prevent such accidents to life and limb as are of frequent occurrence in cities, occasioned by persons being run over by street cars. The safety guard, patented, may be applied to cars and moving bodies of all kinds to prevent any object in front of the car from being run over or injured to any considerable extent.

WONDERFUL DEVELOPMENTS IN OPTICAL SCIENCE.—All complicated cases of defective vision most carefully tested after the most progressive method known to opthalmology, and, if any morbid changes are indicated, I will be only too happy to recommend the best opthalmic surgeon on the coast in time; especially in young children, where progressive myopia is manifested, and thereby induce parents to seek the advice of an oculist. It is a well known fact that the majority of near-sighted persons, especially if suited by a patent process, rest in fancied security, when their cases really need the attention of a pathologist. Near-sighted eyes are looked upon as unsound, with but few exceptions. All errors of refraction corrected with suitable glasses, applicable to myopia, hypermotropia, simple, compound and mixed cases of astigmatism. My lenses are made by the most skillful workmen of Paris, to order. Being constantly occupied in testing defective eyes, I have no disposition to lose valuable time in doing automatic labor at grinding lenses.

C. MULLER, Optician,
5 135 Montgomery St., near Bush, S. F.

Mining and Scientific Press.

LEADING MINING JOURNAL OF THE WORLD.

Established in 1860, this Journal has been eminently successful as a popular and useful mining and mechanical journal. Relative to precious metals especially, it is the leading mining paper of the world.

It is largely patronized by the leading Miners, Mine Owners, Superintendents, Engineers, Metallurgists, Chemists, Manufacturers, Mechanics, Scientific, Professional and Industrial "Men of Progress" on the Pacific Coast, and many leading Mining Men throughout the mining fields of the world.

It is by far the best advertising medium in the Pacific States and Territories for Mining, Mechanical, Engineering Building and Manufacturing Tools and Implements, Goods, Supplies, etc.

Being thoroughly able and reliable in its editorial and business management, and long established in the most progressive industrial portion of the Union, at present, its power as an advertising medium is unsurpassed.

Subscription, $3 a year. Advertising rates, moderate. Send for samples and further information.

DEWEY & CO., Publishers,
251 Market Street, San Francisco

Secure the Reduced Rate.

After the first of April, 1884, we announced a reduction of the price of the MINING AND SCIENTIFIC PRESS from $4 to $3 a year to all who would settle up arrearages at old rates and pay *in advance* thereafter. There are some who have not yet taken advantage of this offer, and we would therefore urge all subscribers still in arrears to remit what is due us to this date, at the rate of $4 a year, and pay in advance for another term at the reduced rates for new subscriptions paid in advance.

The Latest Triumph of Chemical Science.

The Simplest, Cheapest, and most Powerful Fire Extinguisher in existence. Always ready; always effective. Anyone can use it. Endorsed by leading Insurance Companies and Firemen, and adopted for use by thousands of the leading business houses of the country, after thorough tests. The Grenades have already saved millions of dollars' worth of property.

Enthusiastic endorsements from all the prominent Chiefs of Fire Departments in the United States, including Chief Scannell of S. F. Fire Department, and Capt Russell White, of the Insurance Patrol.

LUBRICATING OILS

May we suggest as the result of a long experience in the manufacture and use of Oil, the following facts:

1. Generally, twice as much Lubricating Oil is used as is necessary.
2. The Oils generally used in the West, cost too much money.

There is no use of paying the high prices necessarily demanded for Lard, Tallow, Castor, China-nut, and other animal and vegetable Oils sold for Lubricating purposes.

WE GUARANTEE TO SAVE FROM 25 TO 50 PER CENT.

☞ Please write us briefly for what purpose the Oil is used, and we will return GRATIS enough Oil to prove what we say.

Our Oil has now been adopted as

Cheaper, More Economical and More Serviceable than Any Other Oil

On the Central and Southern Pacific Railroads, the Northern Pacific, South Pacific Coast, and North Pacific Coast Railroads, the Oregon Railway and Navigation Co., Pacific Coast Steamship Co., and all the prominent Iron Works, Saw-mills, etc., on the Coast and Puget Sound.

THE DUNCAN CONCENTRATOR

BEYOND QUESTION THE
Cheapest and Most Effective Machine
OF THE KIND NOW IN USE.

Adapted to All Grades and Classes of Ores.

This machine has been thoroughly tested for the past two years under a great variety of conditions giving most extraordinary results, far in advance of anything ever before realized.

A recent competitive test made with the Frue at the Carlisle mine, in New Mexico, showed an advantage of 30 per cent in favor of the Duncan. The amount saved over the Frue being sufficient to pay the entire cost of the machines nearly every month of the year. The following is an enumeration of its many advantages over all other similar machines:

1. Its cost is not more than half that of any other of equal capacity, and the weight is nearly 1,000 pounds less, thus greatly reducing the cost of transportation.
2. The expense of setting up in running order is not more than one-third that of the Frue, or any other belt machine, much less grading and timber work being necessary.
3. The expenditure for repair is not more than one-fifth that of any belt machine, and they will last fully three times as long, working under the same conditions.
4. Not more than one-half the space is required—a point of great importance where a considerable number are used.
5. No special skill and very little care is necessary to operate it.
6. No more water is required than is furnished by the batteries.
7. It saves all the amalgam, gold or silver, that escapes the batteries, pans or settlers—AN INVALUABLE FEATURE, and claimed by no other, making the machine worth more than it costs for this purpose alone.
8. A much coarser grade of ore can be handled successfully than by any other machine—a great advantage in many instances where fine crushing is not necessary to eliminate the mineral.
9. It has no small and delicate mechanism, requiring nice adjustment and the closest attention—an insuperable objection to all belt and other forms of machines, making them wholly unfit for the rough service of a quartz mill.
10. Great simplicity of construction and small number of wearing parts. The whole machine is comprised in 17 pieces, only 3 of which are subject to any especial wear, and these can be replaced at a nominal cost. The Frue has 113 pieces, and some similar machines many more, making a complication of parts that involves constant repair and great expense in this way, as well as in loss of time.

We are aware that the most sweeping and pretentious claims are made for nearly every concentrator in the market, but it is a well-known fact that the results of their operation have not in any instance made good these claims. The advantages here set forth for the Duncan, as well as the statements made, we are prepared to substantiate by actual working results. **Price, $350. Weight, about 1,750 pounds.**

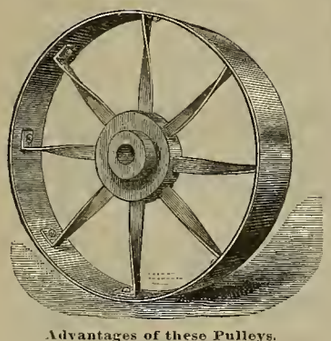
MACBETH'S
—PATENT—
STEEL PULLEY.



Advantages of these Pulleys.
They are less than half the weight of cast-iron pulleys; are polished on the face; are made either crowned or straight, and are turned in the lathe the same as the best make of cast-iron pulleys.
They are carefully balanced. They are subject to no contraction strains, and can be run at very high speed without danger of bursting.
On account of their great lightness and the form of the arms, they absorb less power than any other pulley.
They are *the only pulley of the kind* which runs true. They cannot be broken in transport.

TESTIMONIAL:
MATHER LANE SPINNING CO. (Limited), LEIGH, ENGLAND, Nov. 5, 1883.
N. Macbeth, Esq.—Dear Sir: The Patent Steel Pulleys supplied throughout to our No. 2 Mill are working to our entire satisfaction.
They are very true, and are about 50 per cent lighter than the cast-iron pulleys in our No. 1 mill.
Yours faithfully,
For the Mather Lane Spinning Co. (Limited),
[Signed:] RICHARD T. MARSH, Managing Director.

Economy in space and fuel. Safety at high pressures. Freedom from scaling. Equally adapted for power and heating purposes. Especially adapted for mills, factories, hotels, stores or any place where safety is a necessity. Will work well with muddy water and any kind of fuel.

TESTIMONIALS.

ST. LOUIS, MO., Sept 28, 1883
Messrs. Adolphus Meier & Co.—GENTLEMEN: We cheerfully certify that the "*Heine Patent Safety Boiler*" put up by you in our establishment has proved very satisfactory in its working. The chief points of excellence in the "Heine Safety Boiler" are its economy in fuel and space, freedom from scaling, aptitude for power and heating purposes, working equally well with clear and muddy water. We warmly recommend it to all using steam machinery. Yours truly,
ANHEUSER-BUSCH BREWING ASS'N.

OFFICE OF SUPT OF ROYAL RAILWAYS, BERLIN, Sept. 23, 1883
To Mr. H. Heine, Civil Engineer: In reply to your inquiry of September 2d, we respectfully inform you that the three boilers built under your patents, under steam since September 25, 1881, at the Alexander Place Depot, as well as the two at Friedrich Strasse Depot, under steam since September 22, 1882, have given good satisfaction, requiring no repairs whatsoever to date. The internal cleaning of the boiler was always accomplished with ease on account of the convenient arrangement of the tube caps, the adhesion of scales being fully prevented thereby, and the boilers kept in prime condition.
(Signed): BRAUCKE.

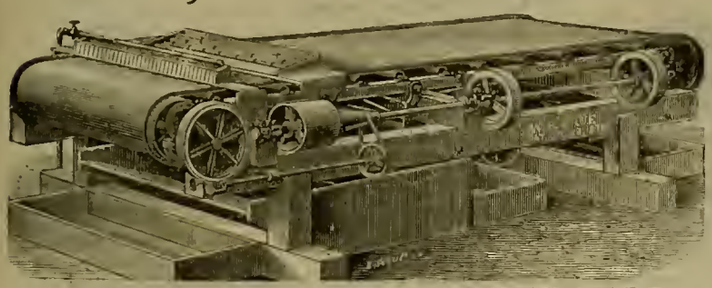
$1,000 CHALLENGE!



THE FRUE ORE CONCENTRATOR, OR VANNING MACHINE.

PRICE REDUCED, Jan. 1, 1884, to FIVE HUNDRED and SEVENTY-FIVE DOLLARS ($575.00).

OVER 800 ARE NOW IN USE. Saves from 10 to 100 per cent. more than any other Concentrator; concentrations are clean from the first working. The wear and tear are merely nominal.

A machine can be seen in working order and ready to make tests at the office of Huckley, Spiers & Hayes, No. 220 Fremont Street, San Francisco.

To those Intending to Manufacture or Purchase the So-called "Triumph" Concentrator, we Herewith State:

That legal advice has been given that *all shaking motion* applied to an *endless traveling* belt used for concentration of ores is an infringement on patents held and owned by the Frue Vanning Machine Company.

That suit has been commenced in New York against an end-shake machine similar to the Triumph, and that as soon as decision is reached in the courts there, proceedings will be taken against all Western infringements.

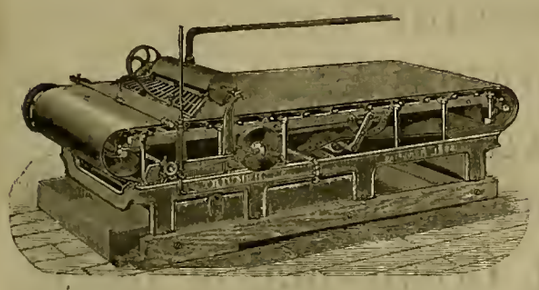
That we are and have been ready, at any time, to make a competitive trial against the Triumph, or any other machine, for stakes of $1,000.

ADAMS & CARTER, Agents Frue Vanning Machine Co.,

Room 7—No. 109 California Street, - - - SAN FRANCISCO, CAL.

January 3, 1884.

$1,000 CHALLENGE ACCEPTED!



THE "TRIUMPH" ORE CONCENTRATOR.

PRICE, FIVE HUNDRED AND FIFTY DOLLARS ($550.00), F. O. B.

THE "TRIUMPH" TRIUMPHANT!

In a competitive trial recently had between two of the "Triumph" Ore Concentrators and the same number of "Frue" Vanning Machines, at the mill of the celebrated gold producing Original Empire Mill and Mining Company, in Grass Valley, Nevada County, Cal., the "Triumphs" produced thirteen and fifteen one-hundredths (13.15) per cent more concentrations than did the "Frue" Vanners, during a run of twenty-four consecutive days, or a net gold coin result of $199.15, or $8.30 per day, in favor of the two "Triumph" Concentrators.

These returns do not include the value of the amalgam saved by the "Triumphs" during the test; which will add to the net gain. The form of construction of the feed bowl is such that considerable amalgam is necessarily saved, which is lost on the "Frue" Vanners.

This trial was conducted under the personal supervision of the Manager and Superintendent of that Company, in a strictly fair and impartial manner, and with the sole view of determining, in the interest of that Company, the merits and demerits of the respective machines by a thoroughly practical test. A relation of the course of procedure, a concise analysis of assays, and a tabulated statement of the net bullion results, with accurate deductions therefrom, will soon be published in Circular form.

The superiority of the present construction of the "Triumph" over the form originally introduced, together with the demonstrated results of the above, and other trials had with the "Frue" Vanners, induce us to and we hereby accept the Challenge of $1,000, flaunted by the Agents of the "Frue Vanning Machine Company," and hold ourselves in readiness to enter into a second competitive trial for that sum, at such place and upon such terms and conditions as may hereafter be mutually arranged.

We guarantee purchasers against all costs, expenses or charges incurred by reason of any infringements of any existing patents.

"Put up or shut up," and "Let the Best Machine win!"

MINING AND SCIENTIFIC PRESS.

An Illustrated Journal of Mining, Popular Science and General News.

BY DEWEY & CO., Publishers.

SAN FRANCISCO, SATURDAY, AUGUST 30, 1884.

VOLUME XLIX. Number 9.

The Frue Concentrator.

There is at this time a very decided interest manifested in the subject of ore concentration, and the question of the relative merits of the different concentrators on the market is being discussed with some spirit. The Frue vanner seems to be the basis of comparison for other makers, owing to its successful work, and the fact that it has of late years been largely introduced, and has displaced types in use before the belt machine was brought to the attention of the mining public. It is a compliment to the Frue machine for the makers of other forms to try to perfect theirs so that they will do equally as good, or better work; and as this business rivalry can only result in benefit to the mining public, by producing perfect concentrators, we have deemed it advisable to present to our readers the statements of the different manufacturers, with some description of the various machines.

In the last two numbers of the PRESS appeared descriptions of the Triumph and the Duncan concentrators, with statements of work performed as compared with that accomplished by the Frue vanners. To some of these statements Messrs. Adams & Carter, the agents of the Frue vanner on this coast, take exception, and it is but just that their side of the question should be presented. In an interview with these gentlemen this week, the following points were elicited:

The Frue Vanning Machine Co. are protected by many patents issued from 1869 to 1883, and they are now applying for other patents; the various combinations of shaking tables with endless uphill traveling belt are thoroughly covered by patents owned by the Frue Vanning Machine Co.

As regards the Duncan Concentrator at the Carlisle mine, the facts, as known to Adams & Carter are as follows:

"Last February or March the Eastern agent of the Frue machine found the loss very heavy in the tailings from the six Duncan Concentrators at the Carlisle mill. He offered to put in five Frues (to concentrate the Duncan's tailings), with the understanding that if the results were satisfactory, the Carlisle Company would accept and pay for the Frues; his proposition was accepted, and the Frues were put in. The result was that the Carlisle Company paid for the five Frues and ordered and paid for *five additional Frues*. Would this have been done if the work of the Duncans was superior to that of the Frues? Most decidedly not."

As regards the trials of the Triumph and Frue machines recently referred to, Mr. Adams says it is well to bear in mind the fact that the Frue Vanning Machine Company claim the Triumph concentrator to be an infringement on some of their patents. They sued an Eastern end-shake machine (the Embrey); and after a long suit found that their opponents had not sold enough machines to cause sufficient damages to cover expenses of suit; but they now own the patent for the same, and now propose to wait until there are a few more Triumphs in use before commencing suit against it. Owning the end-shake machine (the Embrey) of an earlier patent, the Frue Company can put a machine with an end-shake on the market if they feel so disposed. So if there was any special merit in this end-shake motion it could be utilized by the Frue Company without risks of infringement suit; and if it was considered superior to the side-shake they would have used it before this.

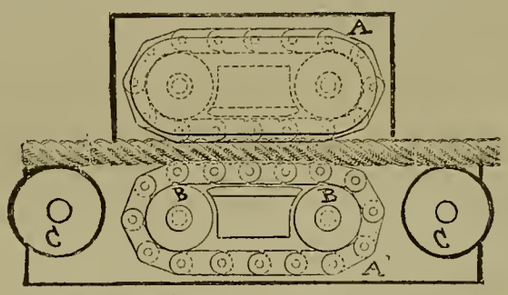
The Frue agents contend also, in the matter of the trial, that "40 ounces of amalgam was not saved on the two Triumphs; the correct amount was only about one ounce, worth perhaps $4 50, not $180; yet the statement is given as if part of the Superintendent's report. And here it may be stated that, in a well-conducted mill, the amount of amalgam escaping from the plates is very small. It is also claimed that the amalgam-saving arrangement of the Frue is much simpler and just as effectual as that of the Triumph. Shaking riffles and copper plates have been used on the Frue vanners or concentrators since 1878, where needed to save amalgam."

"During the trial referred to the Frues worked under the great disadvantage of too much water; but the superintendent refused to allow the amount to be reduced, although repeatedly urged to do so; and he was informed in plain language that the Frues could not do their usual perfect work, as they were forced to use too much water from the battery. Is it fair to expect the best results under the circumstances?"

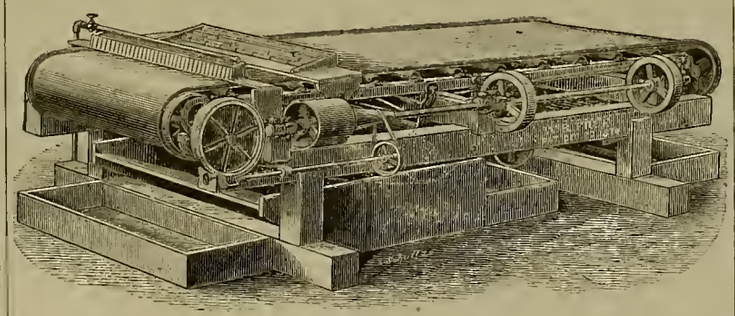
"Still the tailings from the Triumph concentrators assayed one half higher than the Frue tailings, and there was but little difference in the values of assay of the Frue and Triumph concentrations; the difference in the final returns apparently occurred in the roasting and chlorination."

"In regard to the advertised acceptance of our $1,000 challenge, we sincerely hope that our challenge will be accepted, for we are confident of winning in a fair trial; but as the Triumph people have already twice accepted our challenge and then backed out, refusing to put up the money, we fear this is but one more attempt to make capital cheaply by advertising what they have no intention of performing."

The engraving on this page shows the general form of the Frue machine, which is now so well known that it is not at all necessary to give any detailed description. Within the past six weeks seventy of these Frue machines have been sold on this coast; for one mill alone forty eight Frues have been ordered. The company ordering them was informed of the results of the test referred to, and although special inducements and extremely low prices were offered by other makers, the Frues were ordered. After thorough examination and investigation the company became convinced of their great superiority in both construction and durability as well as the superior work performed by them.



TAYLOR'S ENDLESS-CHAIN GRIP FOR CABLE ROADS.



THE FRUE CONCENTRATOR.

MAP OF MEXICO.—A new map of Mexico, compiled from official surveys of the Public Works Department of Mexico by A. F. Labadie, has been published in this city by Gregoise Tanzy & Co. It is a very complete and useful map. It gives the routes of completed railways, railways in course of construction, public highways and roads, telegraphic lines, lines of steamers on coasts, etc. The sudden impulse given to our trade and commercial relations with our sister republic has created an interest in that country, and this new map will be found useful to all having business with any part of Mexico. The maps are sold in pocket-book form for $2 50.

THE Calumet & Hecla copper mine, Michigan, has paid out in dividends a total sum of $25,150,000, which, with the exception of the dividends by the California and Consolidated Virginia Mining companies, is the largest amount ever paid to the stockholders of any mining company in America.

A New Cable Grip.

On this page is an engraving of a new style of grip for cable railroads (now becoming so popular), which is ingenious and simple in construction. Various styles of grips have been invented and described in these columns. Several modifications have also been tried of the so-called solid grip, which is simply an iron vice, with one jaw upon one side of the continuously moving cable the other jaw, upon the other side, with each jaw having a semi-circular groove, the jaws made to approach and recede from the cable for the purpose of starting and stopping the car.

Roller grips have been tried and abandoned, because the contact of the grooved rollers is so small upon the rope, that so great pressure is required to prevent slipping, that the cable is soon injured.

The solid grips have been made of iron and other metals, and even with wood linings, and this style of grip is about the only one in use now, for the want of something better.

This ingenious grip which is here described, was invented by Mr. H. R. Taylor, of this city, and is specially designed to prevent the wear of the cable by transferring the wear (consequent upon a continuously moving body, being made to move or overcome the inertia of a body at rest), to certain parts of the grip, which parts can be quickly and cheaply replaced. The cut does not need much explanation. The wheels *B*, are enveloped by an endless chain *A*. The links and chain are square. The inner flat edge runs upon the rollers, which of course are turned flat to receive them. The outer portion of the chain conforms to the circle of a section of the cable and the chains, one above and one below or one at each side, always move with the cable when in contact with it. Between the rollers *B*, and at the back of the chains are placed lugs which by the mechanism that opens and shuts the grip, are made to press the chain upon opposite sides of the cable, and at this point or upon the surface of the lug and inner side of the chain is the friction and wear. This chain and lug are cheaply replaced, and the expensive cable allowed to move and run for a great while unharmed.

The further advantage of this style of grip is that the sudden jerking of the car at starting will be avoided, because the pressure upon the cable can be made gradually, without wearing it. This chain can be placed upon most of the solid grips now in use without much change or expense.

The chains, *B*, can be easily and cheaply made and a supply kept on hand to replace those worn. The form of these links where they join each other is so made that the groove which is to conform to the section of cable is preserved, whether the chain lie in a straight line or in a curve, so no sharp corners are presented to the cable.

The wheels, or pulleys, simply support the cable, while the system of chains are drawn away from it. The wheels, *B*, and chains, *A*, nearly to their outer edges, are covered with iron plates to keep out dirt and sand.

Mr. Taylor invented this and secured letters patent in 1876; also the past year in this country and in England. It has been examined and admired by many engineers and mechanics and scientific gentlemen. A model of Mr. Taylor's grip can be seen at his office, 120 Market street.

The Scrap Iron Trade.

To the average observer the scrap iron trade is of little importance and represents but a few persons, and the most of those of very indifferent make-up—unwashed, unshaved, mounted upon rickety wagons drawn by old and decrepit horses. The business of collecting also furnishes occasional employment for an army of boys, mostly of the hoodlum type, a large portion of whom find their supplies in poorly enclosed back yards, from whence they are removed by stealth to the junk dealer, who asks no questions as to how or where they were obtained, as long as he makes his purchase for a mere moiety of its true value.

But back of all this there is a large and important industry, employing many men and much capital—an industry which turns much waste to profit, and one which of late years has been reduced to quite a thorough business system.

Contrary to the usual idea, the chief portion of the scrap iron, especially in the United States, comes from the country. Notwithstanding the numerous gatherers, with their rickety old wagons and unintelligible cries, which are constantly met in our streets, the city furnishes a comparatively small part of the "scrap." The country buyers furnish the larger portion for the trade. The wasteful neglect of farmers furnishes tons upon tons of broken and rusted farm implements, which a little care might have preserved and rendered serviceable for many a year longer. The Americans are much more careless in this particular than any other people. Europeans use less tools and take better care of what they do have.

In California, until since the establishment of the Pacific Rolling Mills, scrap iron had but little value. It would not pay to collect and ship East, consequently immense quantities of old iron and steel were thrown into out-of-the-way places, where it was suffered to pass into slow decay by rust or be buried out of sight and knowledge by the gradual accumulation of other rubbish. But of late years all this has been changed, and immense quantities of "scrap" are now being received at the iron works on the Potrero. Those works have also been the recipients of large quantities of old iron from foreign ports, originally from Valparaiso, but recently from Europe, in about 500 ton lots. The Chilians are the Yankees of South America, and are more noted than any other people on that portion of the American continent for their industrious and economical habits. Wagons are employed there to traverse all through the interior of that country for the special purpose of collecting old iron, which is hauled to Santiago, thence by rail to Valparaiso, whence it is shipped to this port, and at a handsome profit. Entire cargoes are sometimes thus collected and delivered.

The bulk of scrap iron used in San Francisco comes from abroad, mainly in 500 ton lots, taken by the ships for dead weight. A large portion comes from London, and a good deal from Antwerp and Hamburg. In London it costs about 50 shillings, the duty is about 27 shillings, and average rate of freight about 20 shillings per ton.

The Valparaiso shipments, formerly so heavy, are comparatively small now. The European scrap iron can be had for less money and is of a better grade and more carefully selected. The scrap is all sorted before being shipped, and is ready for use on arrival.

There are only three local buyers of scrap iron in quantities here—the Pacific Rolling Mills, the Judson Manufacturing Co. and the Pacific Iron and Nail Works.

They consume among them probably over 12,000 tons of scrap iron a year. There is more or less collected on this coast, which must of course be consumed here, for it will not pay to ship away! It is worth about one cent per pound, against $25 to $26 per ton for foreign. That here has to be sold in this market, while that from abroad has to bring a good price or it would not be shipped to this port. The Central Pacific has for some time been selling its old iron rails. There are about 2,000 tons of foreign scrap on the way to this port now.

But whatever its source, "scrap" iron comes to the large buyers in a more or less mixed condition, and has to be sorted before it is ready for the final buyer or the furnace. This sorting is a very important and careful business, and should be done by very honest experts, as upon it depends not only the final value of the scrap, but also of the resulting furnace or forge produce as well. Valuable metals, differing in kind, may be so mixed by the sorter, as to quickly reduce the average cost of all. The presence, to any considerable extent of steel in iron or iron in steel, cast in wrought or *vice versa*, or lower of any kind mixed with a higher grade diminishes the aggregate value for any use, and not infrequently utterly destroys its usefulness for special purpose. The cost of sorting is usually about one dollar per ton, except in very small and badly mixed scrap, when it may largely exceed that amount.

The usual classifications are: No. 1—wrought machinery, stove-plate, steel tires and wagon springs, old plow and plow steel. No. 2—wrought, wrought iron turnings, cast iron borings, malleable scrap and old rails. There are several other classifications sometimes made, but seldom used.

Pacific coast consumers have taken the standard of New York and Philadelphia for number one scrap iron. The specification is as follows: "All wrought iron, round, square or flat, except plates (unless such plates are cut apart and free from angles) one quarter of an inch thick and upwards, shall be accepted as number one wrought scrap iron; but it must be free from rails or rail ends, gas pipe, flues, hoes, shovels, hoops, wire and all similar light iron, and from cast iron, tin and steel."

In making up scrap for the furnaces, the sides and heads are made of pieces of rails, and the center is filled in with miscellaneous scrap, the bundle being secured with wire.

A writer, speaking of the uses to which scrap iron is put, says: "All kinds of scrap are used in many ways and for many purposes. Wrought scrap is usually put in the furnace in piles and reworked into merchant iron. For this purpose it must be fairly free from cast iron and steel. In reworking wrought-scrap forging iron especial purity from the other grades of scrap is essential, a slight admixture of steel or cast scrap rendering it liable to shiver. Machinery scrap is worked up in various ways, piled, balled, etc. Old sheet iron is used for bottoms in puddling, and is not infrequently sunk in charcoal fires and worked into wire. Steel rails are treated in an open-hearth furnace, and used for a number of purposes, going largely into wire rods. The same may be said of steel tires. All classes of cast scrap are pretty generally used in the foundries for casting, though the better grades are sometimes puddled. It is common to puddle stove-plate. Cast borings are treated in the same way as the other kinds of cast scrap. Boiler-plates are usually made of charcoal iron, and the scrap is for the most part sheared and worked into refined iron. Wrought turnings are used in hushelling or puddling furnaces, and are worked into bars. It is so used by a large number of mills. This species of scrap is often sunk in charcoal fires and made into boiler-plate. It is also worked up into nail-plates, etc. The foundries and merchant-iron and nail-plate mills are the largest users of scrap, but its use is by no means confined to these. Old steel rails are sold almost universally by the long ton of 2240 pounds. For other species of old metal various rules as to net or long tons prevail at the East. In the West the net ton is pretty generally accepted."

Gold Mining.

It is evident that a renewed interest is beginning to be felt on the part of mining men in gold-producing mines, as at the present time there is more activity and more new enterprises in the quartz fields of California than for many years past. Several causes have arisen for this. In the discovery and opening up of the riches of the Comstock a great impetus was given to silver mining, as it was believed that more profitable results would follow from that character of mining. In consequence the search for and development of silver-bearing lodes has extended over a vast field, demanding the investment of immense capital and the employment of the largest portion of skilled mining labor. The effect of this was to cause a comparative neglect of gold quartz mining, and the quartz lodes of the western slope of the Sierras, which are more marked and extensive than on any part of the continent, have been left mainly for development to local effort, unaided by the capital that found more attraction in seeking silver. By this partiality on the part of mining investors the product of silver has been unduly stimulated, and gold, the more precious and more necessary metal to the commerce of the world, has not been produced in anything like the quantity for which there has been a demand. Although gold mining has suffered from this want of encouragement, yet it has held its own better than might have been anticipated, and for the reason, as experience has shown, that with increased knowledge of the characteristics of gold-bearing veins, improvements in mining appliances, and better business methods in the conduct of the business, there is as much certainty and profit as in other classes of mining. The existence of pay chutes, their direction according to the dip of the vein, are ascertained facts which now relieve much of the former uncertainty connected with gold mining, so that it is now a mooted question whether in a well-defined fissure vein the pay chute really becomes exhausted, as the deepest workings have failed to settle this point. Silver veins, on the contrary, have ore bodies of richness, and then barren zones that give an element of uncertainty to this class of mineral-bearing veins that makes a hazard that is attended with frequent and enormous loss, of which the Comstock lode is a notorious example. Gold mining is not attended with the same expense as that for silver, as, the lodes being smaller, less costly machinery plant subserves the purpose; and hence it is that individual effort or companies of moderate capital have gone on with the development of mines even while mining capital has given but little encouragement.

But the gold quartz veins of California are not to remain in the future as in the past, if we are to judge by appearances and the disposition being evinced by mining men to give more attention to gold production. The gold is planted in the veins of the Sierras, and the world needs and must have it, and because of this there must be a stimulus to gold mining that will prove a resultant prosperity to numerous mining districts, among which is that of Grass Valley, the pioneer quartz mining district of California, which has always maintained and yet asserts its pre-eminence in the industry.—*Grass Valley Union.*

The Art of Fusion.

If a detailed history of the art of melting could be written it would be found to be as full of interest as that of any other of the arts practiced in the manipulation or the manufacture of metals. It has been well known from the earliest time, and it is certain that it was the first to be largely used, as distinguished from the art of forging or of welding, and of brazing or riveting.

The effect of heat in producing fusion or a softened and melted state is at the present day one of the first points to be noted with accuracy in any examination or testing of a new combination of metals. It is also an important guide to those who are aiming to improve the quality of the metals long known and used in the arts.

If the iron workers of the present day have more resources at their command in the finer qualities of iron and steel which they employ, than the smiths of ancient time, it cannot be said with strict truthfulness that the results of their handicraft have always been proportionate to the abundance of these resources, or such as to fulfill completely the demands which have been made upon them. It is rare that all lines or departments of an art advance with equal steps, and so it is sometimes found to be true that one will be supplanted by another for a time, and that some incidental or collateral advantage will afterward lead to a return to the use of the first. The process of welding for some purposes has at times seemed certain to take the place of riveting, but an immense increase in the sizes of plates and bars which it became practicable to roll, has turned the scale again in favor of the methods of riveting and pinning for the joining of parts to each other.

There are many reasons for believing that the earliest developments in the use of metals were the result of accidental application of fires to them as they existed in their ores; but it is also certain that these chance indications were followed by the most painstaking study of the possibilities of each case, and that the remarkable examples of ancient metal work were in no sense due to any lucky accident, but rather to the skill developed by watchfulness and careful trial of the same methods day after day.

So, also, just now the attention of builders of heavy machinery, and even of large sizes of guns, is turned with deepest interest, and even with great anxiety, to the advance in the art of fusing or melting the high-grade metals, the various qualities or grades of steel of which these heavy pieces are to be made. The progress actually made in this art in this respect is quite sufficient to warrant the fullest expectation that has thus far been entertained of it. The prospect is very clear that with the daily experience of many foundries in the study and practice of the art of fusing that stubborn but valuable metal, steel, the day is close at hand when the more compact and massive pieces or parts of all kinds of machinery will be made of it, to the great advantage of all concerned.

This very important result is due solely to the study and constantly advancing practice of this oldest of all arts in metals, and to the improvement made in the apparatus employed. In this respect, the advance from the time of the mediæval workers is simply incredible; and, indeed, the short space of thirty years covers nearly the whole span from the day of a trifling capacity of furnace for melting to the present time, when the limit is rather the power of existing apparatus to move the finished casting.

In connection with the above, which we clip from the *Manufacturers' Gazette*, the following paragraphs from the *Jewelers' Journal* will also be read with interest, and possibly to the instruction, of some of our readers.

Composite Metals—Alloys of Copper.

Corinthian brass was said to be a mixture of gold, silver and copper, formed by the running together of statues melted in the flames of the city of Corinth when it was burned by its Roman captors. It brought a very high price for generations afterwards. The name "brass" was commonly applied among the ancients to what is now known as bell or gun metal, a mixture of copper and tin. The alloy of copper and zinc was known and used ages before the mixture of the latter metal was discovered; and it is even said that the use of brass was discovered before that of iron. A mass of zinc ore, mingled with charcoal and plunged into melted copper, will yield the metal, which will be at once dissolved by the copper. This was the ancient process, the only one till 1781, and is still in use. Modern modes consist in melting the zinc, and adding copper in thin strips, or in a fused state; or in melting copper and plunging it into lumps of zinc, held below the surface with iron tongs. At the temperature of melted copper, zinc is very apt to evaporate, and, despite layers of fine charcoal or glass on top of the fluid metal, so much zinc passes off that chemical analysis alone can determine the proportion of each metal in the product. The usual proportion is a pound of copper to eight ounces of zinc. "Prince's metal," a beautiful yellow combination, contains equal weights of each ingredient. "Muntz's patent sheeting, or yellow metal," is made of about two pounds of zinc to three pounds of copper. Bath metal, pinchbeck, or Mannheim metal, is made of three or four ounces zinc to a pound of copper. The addition of zinc hardens and whitens the copper. Oxide is also a combination of copper and zinc in the ratio of 100 to 17. Brass can be precipitated from a solution of sulphurets of the two ingredients mixed with cyanide of potassium, by using a galvanic battery with a brass plate attached to the negative pole.

Probably there is no metal capable of producing so many very distinct alloys as copper. These different alloys are distinguished as much by their characteristics as by their color, and in the latter case the color may be made to vary from the red of the original copper to the almost blank white of silver. Take the composition of the widely used Babbit's metal, employed throughout the world as bearings for journals and in other places where friction comes. It is nearly pure white, and yet out of 100 parts of tin, antimony and copper, the copper makes one twenty-fifth, the exact proportion being: tin, 89; antimony, 7.3; copper, 3.7. And there are bronzes used in the arts which have so slight an admixture of lighter-colored metals with the copper as scarcely to change the color of the original and basic metal. Then the uses, the qualities and the purposes of these varying compounds are not equaled by those of any other basic metal. In iron the compounds, or changes, rather, are so slight that it is a puzzle, as yet not entirely solved, to discover and produce the exact change from fibrous wrought iron to crystallized high steel. There are mediums between these two extremes, but these are the extremes, and to produce these from the original metal, and to produce any of the grades between, requires a nicety of manipulation and a knowledge of chemistry and metallurgy that it takes years of application and patience to compass.
